Riverside County's Chamber of Commerce has been organized "to encourage immigration, promote settlement on county lands, secure improved methods of agriculture and bring producers and business men together." The first monthly meeting will be held at Banning the third Thursday in September; the first annual probably at the time of the county fair, October 5 to 9. The following officers have been elected to serve until November, 1916: President, G. E. Snidecor, Corona; A. E. Warmington, Blythe, secretary; H. H. Hoss, Corona, first vice president; A. W. Stewart, Elsinore, treasurer.

The Coast

One hundred acres have been sown to flax at Gaston, Oregon.

Okanogan County, Washington, has the largest grain crop in its history.

The Mesa, Arizona, Farm Improvement Association has organized a cow testing association.

Klickitat County, Washington, has experienced one of the coolest harvest seasons in years.

Five hundred owners of cows at Prosser, Washington, have signed up for a cooperative creamery.

The Cochise County Cattle Growers' Association holds its next meeting at Tombstone, Arizona, Monday, August 30.

This is a poor year for the salmon packers. There is a falling off of from 40 to 50 per cent of the normal pack.

Lettuce growing conditions in the Salt River Valley of Arizona are being investigated by Horticulturist S. B. Johnson of the state university.

Many smut explosions are being reported in wheat threshers throughout Washington. Most of the fires have been put out without serious damage, however.

Wenatchee Valley apples won first prize at the apple show held in connection with the meeting of the International Apple Shippers' Association in Chicago.

The Cochise County, Arizona, Cattle Growers' Association reports that the recent rains have put the range in the Chiricahua Mountains in splendid condition.

A packing company of Helena, Montana, has received a cablegram from Liverpool asking for estimates on cost of a million head of beef cattle delivered at Liverpool.

A census of the apple crop of the Spokane district is being taken by the Spokane Fruit Growers' Company. Indications are now that the complete returns will show a crop of 75 per cent of last year's.

The Utah experiment station is securing a list of all live stock breeders in the state. Communications may be addressed to Dr. W. E. Carroll, Secretary Utah Live Stock Breeders' Association, Logan, Utah.

A produce firm of North Yakima, Washington, has just shipped a ton of potatoes to an Oregon buyer by parcel post. The consignee lives in the interior of the state and stage rates are several times the postal rates.

The director of the bureau of markets of the United States department of agriculture has given as his opinion that the Fruit Growers' Council is not in violation of the law, being a partnership rather than a federation or organization.

A farmers' convention and motorcade is being held by the Farmers' Improvement Association of Cochise and Santa Cruz Counties of Arizona Friday and Saturday of this week at Douglas. The automobile trip will include Bisbee, McNeal, Webb and Whitewater, where soils, crops, livestock, silos and pumping plants will be inspected.

Climax Ensilage Cutters

In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequalled in simplicity, strength, durability, convenience and safety in operation, and the excellent quality and uniformity of the silage.

For ensilage cutter of the side-wheel type, 5 to 50 tons of green corn per hour, other feed in proportion. For further particulars, call on or address

Live Stock and Dairy

AN OPPORTUNE TIME TO BUILD SILOS

Written for California Cultivator
By W. S. Guilford

MORE silos will be built in California this year than ever before in the history of the state, and if the hay crop is as short as reported and the price of hay reaches the high mark common when the crop is light, those who have crops from which silage can be made and build silos now to put the forage in will be very fortunate.

There is yet plenty of time to build silos this year. Many were put up in September last year, and I know of one that was not finished until October that was filled with a mixture of crops that made silage of the highest quality and made it possible for the owner to handle a lot of stock at a profit that he would not have been able to otherwise. The silo referred to was a stave silo sold by a California company.

At this time it seems to me that anyone with a lot of stock to feed should consider the silo situation very seriously if it has not already been done.

So much beef and mutton finishes nicely on grass that supplementary feeds are little thought of, yet there are many times in a ten-year period when a quantity of succulent, rich corn silage will be worth a great deal of money. Right now there are certain percentages of the lambs and ewes that come off the ranges that are not fat enough for market, and they will not fatten on the feed they have been getting. In order to sell them for mutton it is necessary to carry them over until next spring and fatten them on the fresh feed then. If silage is available now for such animals they could be finished off and sold in six or eight weeks.

The same thing is true of beef cattle that are only partly fat. Such animals can be carried over until another year or fed on hay or grain or alfalfa, but make much better gain on a combination of hay and silage with possibly some grain.

Many alfalfa fields are not yielding more than half the tonnage they produced last year. There are probably different reasons for this in different fields, but the wet winter season undoubtedly had something to do with it. One theory advanced is that a part of the root system of the plants in some fields was rotted; another, that because of the late rains one or two irrigations have been missed; others contend that the moisture was lost from the ground very rapidly during the dry wind periods this spring and that it was impossible to get the moisture back deep into the soil again, and the crop has suffered thereby.

But whatever the cause the fact remains that the alfalfa crop is short, that a large part of the first cutting was destroyed by rain and that some of the large producers of hay are not offering any for sale, in anticipation of higher prices later in the season.

All of which is strong argument in favor of silo building.

Dairymen should be particularly keen to build and fill silos if they

have anything to fill them with, for corn silage is a good addition to the ration for a dairy cow even when alfalfa is plenty and cheap.

Innovations in agricultural practice are not generally established with great rapidity. Something over 30 years ago there were about a hundred silos in the United States, and although every one of these was a practical demonstration of the value of silage it has taken three decades for them to come into general use, and now there are many, many feeders of stock who know little of the value of silage and apparently take no interest in finding out about it. This is particularly true of California. In Wisconsin there are over 50,000 silos.

I saw a silo opened recently at Butte City Ranch at Butte City in Glenn County. It is being fed primarily to a lot of old ewes, but all of the live stock on the place appreciate it. The mules are very fond of it; the chickens and turkeys eat it; the sheep had to be starved to it at first; but the registered Berkshire hogs seemed to have the greatest liking for it. One very fine lot of young boars that are being fed and cared for with their greatest possible usefulness as breeding animals in view were already getting alfalfa pasture, middlings, tankage, barley, oil meal and a mineral mixture consisting of lime, ground phosphate rock, charcoal, ashes, sulphur, copperas, salt and ground bone, a combination that, with plenty of exercise in a woodland pasture, would seem to be about all that a hog could desire. With their herd of over 200 hogs it is possible that the silage could be made a part of a ration with profit even if no sheep or cattle were on feed at the same time.

Although there has been considerable difference of opinion as to the value of silage for swine, and it is undoubtedly true that silage alone would be too much roughage and too bulky, it is certainly a fine "part of a ration."

When this silo was filled some of the corn was pretty ripe, well past the dough and much of it fully ripe. A stream of water from a three-quarter inch hose was run into the cutter so that all of the corn that went in was thoroughly wet. The silage is coming out as fine as any I ever saw anywhere; it is in perfect condition.

RELATIVE NUTRITIVE VALUES OF FEEDING STUFFS

Written for the California Cultivator
By F. W. Woll

"What is the correct standard to go by, Henry's Feeds and Feeding or the United States Bulletin, No. 22, regarding percentage of digestible nutrients in different feeds? For instance, Henry gives beet pulp only 69 per cent of digestible nutrients and the United States bulletin gives it 72.2 per cent.

"What is the best guide in determining the food value of a concentrate, the percentage of digestible nutrients or the experiments carried out at the different stations? For instance, beet pulp which contains a much greater percentage of digestible nutrients than bran was found to be only two-thirds as valuable for dairy cows.

There is a Big Difference IN SILAGE

THE SUCCULENCE and PALATABILITY of perfect ensilage produces maximum results at a low feeding cost.

NO OTHER FEED contains as much "succulence value" as well preserved ensilage.

IT IS THE MOST ECONOMICAL FEED for summer as well as for fall and winter.

BUT THERE IS AS BIG A DIFFERENCE in silage as there is in silos.

AN ABSOLUTELY AIR AND WATER-TIGHT silo is needed to produce good silage.

IT MUST NOT LEAK OUT THE JUICES or admit the air to the silage.

TO MEET THESE REQUIREMENTS, a silo must be of such design, material and workmanship that it will be for many years just as serviceable as when first erected without its being necessary to rebuild every year.

THE IDEAL GREEN FEED SILO will keep ensilage as fresh and succulent all the year as the day the corn was cut.

ERECT AN IDEAL GREEN FEED SILO and stop silo troubles forever. Built of California redwood; it will last a generation.

at the Wisconsin station. Cornmeal, which contains a much greater percentage of digestible nutrients than beet pulp, was not found to be any better for lambs at the Michigan station. According to these arguments, therefore, bran is 50 per cent more valuable than corn. Is this correct or are the experiments misleading?

'Is steam-dried beet pulp more valuable than fire-dried beet pulp?—J. W. McA., Chino.

The questions raised by the correspondent are perfectly legitimate, but he overlooks the fact that it is very difficult, if not impossible, to determine the digestibility of concentrates with any degree of accuracy. Differences of three per cent in the digestible nutrients are, therefore, of no importance. Different digestion experiments with the same lot of beet pulp, e. g. would be likely to show considerably wider variations than this, and still greater differences would be obtained in the case of different shipments of pulp, or if this were fed in combination with different feeding stuffs or to different farm animals. As a matter of fact the amounts of digestible nutrients that a certain ration with beet pulp would be found to contain would be practically the same, whether the digestible nutrients in the pulp be assumed to be 69 or 72.2 per cent. It would only make a difference of .3 lbs. if 10 lbs. of pulp were fed, and .1 lb. for 3 lbs. of pulp, which may be considered an average allowance of this feed for dairy cows or beef cattle.

The answer to the questions raised in the second paragraph is suggested by what has just been said. The digestible components of concentrates can only be determined with approximate accuracy where they cannot be

fed alone, as is the case in feeding pigs, and the result of digestion trials with different feeds that have been made so far are, therefore, sometimes at variance with what practical feeding experience has taught us as to the relative value of feeds. Wheat bran shows up less valuable than either corn meal or beet pulp because the proportion of fiber in this feed is much larger than in corn meal and the character of the fiber in the bran makes it more resistant to the action of the digestive fluids than in the case of beet pulp. The apparent discrepancies for digestible nutrients in these feeds are therefore easily understood, but if the amounts of net energy supplied by the three feeds are considered we also arrive at conclusions that do not agree with the actual nutritive effects, as shown by direct feeding experience. According to the latest and best information on this point 100 pounds of bran supplies 48 energy values, Indian corn nearly 89, and beet pulp 60. The energy expended in the labor of digestion is accounted for in these figures, like the mastication, insalivation, moving the food through the digestive tract, etc. The figures should, therefore, represent the energy that will be available to the animal for the manufacture of new tissue or elaboration of animal products, but no one familiar with these feeds will seriously maintain that the figures quoted give a correct measure of the relative nutritive effect of the feeds; evidently some unknown factor or some inaccuracy of method of experimentation has entered into these determinations that vitiate the results obtained. The total digestible nutrients furnish probably a more correct guide to the relative values of these particular feeds, although a larger proportion of energy

is doubtless expended in the labor of digestion in the case of wheat bran than with either of the other feeds mentioned.

On the other hand, feeding experiments sometimes lead to misleading results through errors of experimentation, such as including too few animals in the trial, conducting these for too brief periods, or other disturbing factors. Instead of accepting as final the results of a single experiment like that of the Wisconsin trials quoted, for which the writer happens to be responsible in part, one must, therefore, consider all evidence that has accumulated in order to determine the value of a certain feed in comparison with others. This is done in the so-called feed unit system. As explained in my book, "Productive Feeding of Farm Animals," this system furnishes a very convenient and satisfactory, practical method of determining the comparative nutritive value of feeding stuffs—not to the exclusion of other methods of arriving at such values, but as a supplementary means of determining these. According to this system the nutritive value of the cereals, except oats, are considered a unit, and it takes 1.1 pounds of wheat bran, oats or dried beet pulp to equal 1 pound of cereals in nutritive effect.

I am not aware that beet pulp is dried by any other method than in dry-heat ovens at high temperature. If it could be dried economically at lower temperatures there might be a certain advantage, as the depressing effect of heat on the digestibility of the protein substances would be less marked than in the case of pulp dried by the ordinary method. There would not be much gain in this direction, however, since the digestibility of the protein in fresh beet pulp is 60 per

cent and in dried pulp 51 per cent; the carbohydrates of dried beet pulp have also a somewhat lower digestibility than those in the fresh pulp.

FOOT AND MOUTH DISEASE AND THE PANAMA-PACIFIC LIVE STOCK SHOW

Editorial Correspondence

New outbreaks of foot and mouth disease are reported in the Chicago territory and elsewhere in the Middle West. It had been hoped and believed that the disease was well under control and that stock from the herds that had been free from the disease could safely be brought to the Panama-Pacific International Livestock Exposition Shows this fall. Now it is doubtful if the present outbreak will be cleaned up in time to make this safe.

Few people realize how much credit is due to D. O. Lively chief of the livestock division of the Exposition, for his consistent and firm stand in the foot and mouth disease situation. From the first he has insisted that the live stock interests of the Pacific Coast be protected and safeguarded in every way from any possible infection. To bring the big pure bred live stock association, to see the advisability of getting behind this Pacific Coast show in a strong way financially and otherwise, has been a tremendous undertaking, and it was a still more difficult task to prevail upon the leading breeders of the Central and Eastern states to bring their studs, herds and flocks across the continent to this Exposition.

And whether the show is held or not, Chief Lively has accomplished work of a great value to this Coast in making the leaders in the live stock business in the East understand that we have a great stock industry here

THE TWO GREAT SALES

Individuality! Size! Conformation! will be the striking features of
The Combination Sale

A. W. Morris & Sons
WOODLAND, CALIFORNIA

McAlister & Son
CHINO, CALIFORNIA

175 High Class, Registered **175**
Holstein-Friesian Cattle
TUBERCULIN TESTED

State Fair Grounds, Sacramento, Cal.
OCTOBER 6-7, 1915

Never before in any sale in the World have such wonderful individuals of size, growth and conformation been offered to the public. Look at this list of offerings strictly from a standpoint of individuality!

KING SEGIS PONTIAC EMPEROR—not alone the greatest bred bull but one of the greatest individuals ever offered at public sale, having three times won first prize at the State Fair, including two Grand Championships; also ten of his best daughters, one of whom has won first prize for three consecutive years.

LORENA KORNDYKE—one of the world's greatest show bulls, having won for four consecutive years at the State Fair, including two Grand Championships; also ten of his daughters, several of whom have been prize winners in the show ring.

Twenty daughters of **KING PONTIAC TOPSY**, one of the best sons of the King of the Pontiacs, that average in weight at 12 months of age, 895 lbs., and are superb individuals.

Five daughters of **DE KOL HENGVERELD BURKE**—a bull of wonderful constitution and conformation.

Four daughters of **KING KASTELEINTJE SEGIS**, whose six nearest sires and dams have all been first prize winners.

Other cows and heifers of individuality, size and conformation never equaled in any other sale anywhere.

BRED TO BULLS OF SURPASSING EXCELLENCE!

Including sons of **TILLY ALCARTRA—RIVERSIDE SADIE DE KOL BURKE—ARALIA DE KOL**, cows with not only World's Records but of unsurpassed individuality, whose sons have inherited their strong qualities. Also a son of the greatest show cow the West has ever known, **DE KOL OF VALLEY MEAD**, and one of the best sons of the King of the Pontiacs—and a prize winner at the State Fair.

BULLS GOOD ENOUGH TO BREED TO THESE FEMALES!

A strong statement but a true one! Included in the list of bulls are not only the great sire **KING SEGIS PONTIAC EMPEROR** and **LORENA KORNDYKE**, but also a son of **De Kol of Valley Mead II**, a world's record cow and a first prize winner. A son of the 1000 lb. butter cow, **Miss Blaney**, and a show bull in every respect. A son of a 31 lb. 4 year old, and other sons of great yearly record cows sired by sons of World's Champions. And these are not all! About 20 more nice ones.

TERMS: \$500 and under cash, over \$500 one-third cash, balance in 3, 6 and 9 months with bankable note and 8% interest. 3% discount for cash on time sums. Buyers from a distance must bring satisfactory bank references. Catalogs ready about September 10. Write for one.

F. L. MORRIS, Woodland, Calif.; **JAMES W. McALISTER JR.**, Chino, Calif., Sales Managers.

COL. BEN. A. RHOADES, Los Angeles, Calif., Auctioneer.

NOTE.—Foot and Mouth disease has again broken out in the East and Middle West. Your only opportunity to secure high-class Holsteins at your own price for many months will be at these two sales.

The California Holstein Breeders' Second Consignment Sale

175 REGISTERED **175**
HOLSTEINS
TUBERCULIN TESTED

Hanford, California

October 14 - 15, 1915

Do You Want Proof? Here it is:

About 25 A. R. O. cows with records as high as 29.90 lbs., made as a 4 year old, including a cow with a 3 year old record of 24.45 lbs., and others over 20 lbs.

About 30 daughters of great record cows, including a daughter of a 30 lb. cow, 2 daughters of the cow with the 29 lb. 4 year old record. Daughters of the cow with the 24 lb. 3 year old, daughter of a 24 lb. 4 year old, 3 daughters of a 22.50 lb. cow, and others from large record dams.

DAUGHTERS AND GRANDDAUGHTERS OF GREAT SIRE!

Including 15 daughters of **COLANTHA SIR PONTIAC AAGGIE**, the greatest bred son of **COLANTHA JOHANNA LAD**, nearly all from large record cows with records as high as 30 lbs., and daughters and granddaughters of such great sires as King of the Pontiacs, Pontiac Hengerveld Parthenia, Homestead Girl De Kol Sarcastic Lad, Sarcastic Lad, Juliana King of Riverside, and others of equal note.

BRED TO SONS AND BROTHERS OF WORLD'S CHAMPIONS!

What will the calves of such great cows and sired by such bulls as Tilly Alcartra Son, Arcady Pontiac Wayne Hengerveld, Judge Hengerveld De Kol, both brothers of World's Champions, Prince Juliana De Kol Walker, son of former World's record heifer, Dichter Spotford Korndyke Lad, son of a 36 lb. cow, and King Segis Pontiac Emperor III, out of a cow with a butter record of 870 lb., be worth? Can you ever estimate their value?

A GREAT LOT OF BULLS!

Including King Segis Pontiac Emperor III, Sir Holland Gant, one of the greatest show bulls in the West. A son of a cow with a record of 772 lbs. butter in a year, a son of King Pontiac Topsy, out of a 28 lb. daughter of the \$25,000 sire Johanna McKinley Segis, a son of a 28 lb. 4 year old, sired by King Segis Pontiac Emperor III, and others worthy to head your herd. Write for catalog.

JAMES W. McALISTER, JR., Chino, Calif., Sales Manager.

REDWOOD MANUFACTURERS CO.
1604 Hobart Building, San Francisco

and that our efforts are not all directed to raising palms and roses and oranges.

With his heart set on making this Panama-Pacific show the greatest ever held in America, and with a reasonable expectation that his efforts would result in this, it will naturally be a great disappointment that anything should interfere.

But there has never been a suggestion of any modification of the quarantine, however slight, that might enable breeders to come here to the fair. It has been urged from the start that the quarantine be held absolutely rigid until all possible danger to Pacific Coast interests was past.

What will develop in the situation during the next few weeks is impossible to prophesy, but there is little chance of eastern herds of cattle, sheep and hogs coming to the exposition.

This makes a great opportunity for Pacific Coast breeders to make a big showing. Some of the best stock in America is being bred here, all that remains is for the breeders to get it in shape and exhibit it.

HOLSTEIN SALE AT HANFORD

There will be offered at the California Holstein Breeders' second consignment sale at Hanford, October 14 and 15, 175 head of high class regis-

22.5 pounds; Molly De Kol Glasgow who has a record of 19.58 pounds, and Vogelschem who made 19.58 pounds and won \$50 prize money from the association.

There will be 15 granddaughters of the world's famous sire, Colantha Johanna Lad, sired by his best bred and best individual son, Colantha Sir Pontiac Aaggie, who is out of a 21-pound daughter of the former world's record cow, Aaggie Cornucopia Pauline. His two granddams were both the greatest cows of their day, one having a 34-pound and the other a 35-pound record.

These heifers are a wonderfully uniform lot, possessed of great individuality and constitution and are from well bred cows with records of 30 pounds, 29 pounds, 24 pounds and 22 pounds butter. They will be in calf to one of the greatest bred bulls in the United States, and they offer an extraordinary opportunity to the buyer who wishes to secure foundation stock of the very finest quality.—James W. McAlister, Jr.

We have correction to make in the advertisement of the Hanford sale which appeared in last week's paper. There are to be 175 animals sold there instead of 100, as stated.

tered Holstein-Friesian cattle. Amongst them is the entire herd of Mr. C. C. Lester of Gilroy, of about 60 animals, including many high record cows. There will be offered Wisconsin Daisy of Sleepy Hollow who made 29.91 pounds butter from 619.4 pounds milk in seven days, milking as high as 102 pounds of milk the last day she was in test. She would have increased her record undoubtedly three or four pounds more of butter had not her test been unfortunately discontinued through a mistake. She, however, did even better than her official record on private test, making 663 pounds milk in seven days, and 2613 pounds milk in 30 days, testing 3.6 per cent, and it is to be expected that she will make over 35 pounds butter the next time she comes into milk.

This is one of the highest record and best bred cows that has ever been offered for sale in the West. She is a daughter of Anselmo, who is already recognized as one of the greatest sires of the breed, his daughter averaging over 21½ pounds of butter for seven days, which record is approached by very few other bulls.

Two other daughters of this wonderful sire will be sold, including Colantha of Sleepy Hollow II, a 24-pound three-year-old, and there will be other high record cows, including Mercedes Korndyke De Kol Johanna who made

of the University of Arizona college of agriculture is sending out a good sized hanger suitable for hanging in stores, postoffices, etc., which reads: "Which Road, Mr. Farmer?" and underneath is an engraving showing a roadway through the country which finally branches. On one of the branches is a signboard reading, "Alfalfa Market Through the Dairy Cow \$25 Per Ton." In the distance is the creamery and toward it travels an automobile loaded with cans of cream. On the other whose signboard bears, "Alfalfa Market \$8.00 Per Ton," is the team and wagon hauling baled hay to a freight train. Underneath in large type we note:

"THE DAIRY COW"

"Will Increase Your Profits by marketing your alfalfa hay at \$25 per ton, giving you a monthly income, improving the fertility of your soil."

"The Only Cow for You Is a Big Milk Producer."

"Find Out How to Make Money in Dairying."

Horse breeding community work is handled by farmers in many communities throughout the Middle West, groups of farmers who recognize the value of an excellent stallion of pedigree for crossing on their farm mares forming stallion companies to buy horses that one or two men would be unable to handle.

Poultry for Profit

PROGRAMS FOR A. P. A. CONVENTION AND EXPOSITION SHOW

DIRECTOR QUISSENBERRY, in charge of the egg-laying contest at the Panama-Pacific Exposition and the poultry exhibits which will be featured later, suggests that poultrymen bear in mind that entries for the greatest poultry show ever must be made on or before October 15. It will be great honor to the poultryman who wins ribbons at this great show and he must not overlook the closing date for making entries or he will have no opportunity for winning honors. Don't delay until too late. Write for entry blanks at once. By the time you can get blanks and make your entries it will be show time. This is important and you should give it attention today. It will do no harm to get the blank and have it on hand even if you should fail to use it.

In connection with the poultry show there will be the 40th annual meeting of the American Poultry Association, the first ever held on the Coast. The following will be the program:

Monday, November 15

8:00 p. m. Reception at Inside Inn for all members of the American Poultry Association and their families.

Tuesday, 9:30 a. m.

Address by Lyman C. Byce, president of the American Poultry Association of California and member of the executive board of the A. P. A.

Address by D. O. Lively, chief of the Department of Live Stock.

Address of welcome and presentation of the exposition medal, Pres. Chas. C. Moore.

Response by E. B. Thompson, president American Poultry Association.

History of the American Poultry Association, by Sec. S. T. Campbell.

"The Poultry Industry, Present and Future," Grant H. Curtis.

"Breeding and Feeding for Egg Production," C. T. Patterson, pathologist at the Missouri state poultry experiment station, illustrated.

Wednesday, 7:30 p. m.

"Open-air Housing of Poultry," Dr. Prince T. Woods.

"Methods That Have Made Possible the Getting of a Living Out of Poultry," W. Theo. Wittman.

10:00 p. m. All A. P. A. members and their families will be furnished tickets to the Ostrich Farm, Yellow Stone Park, Old Faithful Inn and various interesting concessions on the Zone

Thursday

Opening of the great Panama-Pacific Universal Poultry Show.

Friday morning there will be a three hours scenic boat trip out through Golden Gate and to interesting points surrounding San Francisco Bay. If 100 or more make the trip it can be made at a cost of only 65 cents each.

"Waterfowls and their Management," Judge Chas. McClave.

CALIFORNIA STATE SHOW NOTES

Much interest is already being shown by the California breeders in the show to be given by the California State Poultry Association at Sacramento, January 14 to 18, 1916. The officers of the state association are planning on big things for their first show, and they are being enthusiastically assisted by all members of the Sacramento association. Many inquiries are now coming in to the secretary's office regarding the show, and present prospects point to one of the best and largest shows on the coast. This show will come just at the beginning of the breeding season and a win made then will be of great advertising value to the lucky breeder as all will be getting ready then to place their orders for stock and eggs; a win then will bring immediate results.

There will be five ribbons in each class and cash prizes will be paid for the first three places as follows: \$2.50; \$1.50 and \$1.00 on singles; \$8.00; \$5.00 and \$2.00 on pens. There will also be a big collection of trophy cups, medals and specialty club ribbons. Hinds, Luce and Russell have been engaged to judge the show. They are all popular judges on the coast and will draw big entries.

The premium list will be ready for mailing about the middle of September. Send in your name now for a copy. The secretary is C. A. Wilkins, Box 1117, Sacramento, California.

BETTER EGGS

It has been estimated by the United States department of agriculture that the annual preventable loss due to the present system of handling eggs is 17 per cent.

The egg handler at the local market and the producer are deemed responsible in a large way for the low prices of summer eggs and the large loss that occurs. The method of handling the eggs upon the farm and the methods used by the receiver are unquestionably very much at fault. The inferior quality caused by poor management can be very largely remedied if the following suggestions are carried out:

Do not keep mongrel stock. Select pure breeds that lay more and larger eggs.

Gather the eggs at least daily, so that none remain in the nests over night. Twice daily is better during very warm weather.

Only such nest eggs as gypsum or china should be used.

Provide plenty of clean, vermin-proof nests in the houses.

Do not sell questionable eggs that come from stolen nests.

Avoid marketing dirty eggs by using clean quarters. Eggs should not be washed, as it spoils their keeping qualities.

Store the eggs in a dry, cool, well ventilated place away from flies or bad odors.

Market eggs as often as possible, two or three times a week in hot weather. Protect from the hot sun when taking them to market.

Market only eggs of standard size and keep the small inferior ones at home. A standard size dozen should weigh one and one-half pounds.

Produce infertile eggs. Remove the male birds from the flock immediately after the breeding season. Fertile eggs cause a loss of \$15,000,000 in the United States every year.

Use an attractive package. The paper cartons holding one dozen each are cheap and attractive.

Combine shipments as a matter of

economy. Do this by forming community egg circles and egg marketing clubs.

It demonstrates the REAL earning power of money, and shows how anyone, no matter how poor, CAN acquire riches. INVESTING FOR PROFIT is the only progressive financial journal published. It shows how \$100 grows to \$2200. Write NOW and I'll send it six months free. H. L. Barber, 430, 23 W. Jackson Blvd., Chicago.

If you're not satisfied with your present job, you can make good wages selling our Teas and Coffee. Some of our Agents are making \$40.00 per week. For our special offer write C. B. Wheeler, 605 Crocker St., Los Angeles.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

Dried and Ground Kelp, running 13 per cent actual potash. Write for prices. Standard Fertilizer Company, 701 H. W. Hellman Building, Los Angeles, Cal.

Cedar Posts—Split from Washington Red Cedar. Get our prices before buying. G. R. Kirk Co., Tacoma, Wash.

FARM LANDS FOR SALE

"GOOD NEWS FOR YOU" SCHOOL LAND

will soon be on the market, under more favorable conditions than formerly. In 1853 the United States gave California School Land in ALL COUNTIES. For many years no one could buy it. But school land has been coming back all the time. YOU now have a LARGE AMOUNT to select from. Will you get YOUR share? We have spent over 25 years and many thousand dollars searching State and Government Land records. Do you want the results of our work and experience for small fees? Lists of STATE Land in any 3 Counties, \$5. County Sectional maps showing Vacant GOVERNMENT land plainly marked \$2.50, any county. State Map showing SCHOOL Land in California, \$2.50. Your rights are worth over \$1000 if used SOON. Order TODAY, Joseph Clark, Searcher of State and Government records, Manager, California State Land Information Bureau, 1511 K St., Sacramento.

The owner of 3000 acres near Madera desires to subdivide for real settlers; the land is typical San Joaquin valley loam, free from alkali, and will grow anything; railroad crosses property and there is abundant water at shallow depth; the land is for sale at the right figure to people with proper qualifications; no cash payment down and terms to suit, provided the purchaser has sufficient money to put the land under water. Remember that there are no real estate commissions to pay to swell the price of the land; all the owner wishes is interest on his money. No real estate agents need apply. GREENE ESTATE COMPANY, 207-208 Berkeley Bank Building, Berkeley, Cal.

Carlsbad irrigated lands—bordering ocean; on State paved highway and Santa Fe Ry., 80 miles south of Los Angeles. Government records show Carlsbad warmest in winter, coolest in summer of any spot in California. Deep soil, model water system, low rates. Lemons mature in summer when price is highest. Immense profits in fruits and berries adaptable to coast territory. Winter vegetables without competition. Minimum temperature 1914 was 41 degrees. Tomatoes, chili, peas, beans, eggplant, rhubarb, etc., bring \$150 to \$400 per acre. Easy purchase terms. Liberal leases. SOUTH COAST LAND CO., GEORGE BUXTON, SALES AGENT, CARLSBAD, CAL.

For Sale—Tulare 40 acre dairy and hog ranch, 2 miles from Tulare, 1/2 mile to school on oil road and R. F. D.; good pumping plant, house, barn, outbuildings. Will give good terms; might consider part trade. For particulars address Box H, care Cultivator.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

Do you want a hog ranch? If so and you have a little money, write for my proposition to start you. E. A. Stephens, 945 Orange St., Los Angeles.

DUCKS

Ducks—High class Mammoth Imperial Pekin Ducks for breeders. Best stock in California. Stone Canyon Poultry Farm, near Sawtelle, Calif. P. O. address Sawtelle. Sunset Phone, Santa Monica 565-M.

STANDARD APPLE LAW

(Continued from page 199)

or sold, and to inspect all apples and apple boxes found in any such place.

"(b) To design, and cause to be printed or lithographed, suitable uniform stamps to be used on apple boxes, as required by section four of this act, to sell the same as hereinafter provided, and to prescribe the method of canceling the same.

"(c) To appoint, superintend, control, and discharge, such inspectors, in accordance with the provisions of the civil service law of the state, for the special purpose of enforcing the provisions of this act, as in his discretion may be deemed to be necessary,

and in conjunction with the board of control, to fix their compensation, provided that no inspector shall be paid more than five dollars per day.

"(d) Personally, or through any deputy or any such inspector, to seize and retain possession of, any apples or apple boxes packed, shipped, delivered for shipment, offered for sale or sold, in violation of any of the provisions of this act.

"(e) In the name of the people of the state of California to cause to be instituted and to prosecute, in the superior court of any county or city and county of the state of California, in which apples packed, shipped, delivered for shipment, offered for sale or sold, in violation of any of the provisions of this act, may be found, an action or actions for the condemnation of apples as provided in section 11, of this act."

WINTER VEGETABLE UNION GETS TO WORK

At a meeting of the board of directors of the Winter Vegetable Union, held in the Chamber of Commerce rooms, San Diego, Saturday, the 21st, it was reported to the board that the incorporation of the association was completed and that all was in readiness to proceed with the final steps leading to the completion of the association.

Director Sharpe was made a committee of one to make tentative connections with brokerage firms in the Northwest and in general to get information from the large produce dealers in that district that the association would be in readiness to ship vegetables, beginning approximately November 1.

The board of directors expressed the wish that the fact be published that they were in the field for a manager of the association and would appreciate applications from parties who have had experience in handling produce of this character. The officers of this association are: H. Culbertson, El Cajon, president; E. L. Owen, La Mesa Heights, secretary. Directors, J. S. Scott, El Cajon, W. R. Edwards, Chula Vista, J. S. Hull, Nestor, W. Sharpe, Nestor, I. C. Robinson, La Mesa.

ORANGE SHOW

The National Orange Show management has fixed upon the date of February 17-24, 1916, for the sixth annual show. F. M. Renfro will be general manager, working under the direction of a large executive committee of San Bernardino people. The general scheme of ornamentation has already been settled upon. It is stated that it will have the general appearance of a veritable garden, with song birds, greenery and flowers. Pergolas, vines and growing things will make up the principal features. The advertising poster design has already been chosen, one of the features of which will be the arrowhead, a famous landmark near the city of San Bernardino.

LINDSAY

By M. Nelson Moore

Lindsay, the gem of the San Joaquin, Where thousands of acres of orange groves green Lade the air with their sweet perfume, In that festive land of fragrant bloom.

Lindsay, the pride of all rich Tulare, Nature has lavished her gifts most rare, Her wonderful groves as banners furled Send her fruit all over the world.

Blossoms sun-kissed into cups of gold, Nectar, ambrosia for gods they hold; A fair summer land of gold and green, Lindsay! We crown you the Citrus Queen.

Questions and Answers

THE EDITOR

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Cowpeas as Poultry Food

What is the value of cowpeas, field peas, soy beans, fenugreek and sunflower seed as a chicken feed?—Subscriber, Tulare.

All kinds of peas and beans are valuable because of their high protein content. I suppose fowls can be taught to eat them green, but they are usually dried and ground and mixed with ground grains in the dry mash. The soy bean is most generally used. It contains over 40 per cent of protein, and must therefore be used with caution because these rich foods are difficult to digest, but it can well be made 10 per cent of the mash. Cow peas have a nutritive ratio of 1 to 3 and dried field peas a nutritive ratio of 1 to 6, according to Professor Jaffa's table. A larger per cent of pea meal than of soy bean meal can safely be used in the mash and it will take the place to a large extent, though not altogether, of beef scrap.

Sunflower seeds are one of the best of poultry feeds, having a protein content about like that of good wheat bran. They contain also about 20 per cent of fat and oil, and this makes them rather fattening for regular use. They are especially valuable in molting time and if given as a full meal (a handful to each bird) four times a week will bring the birds through the molt quickly and in good condition. Perhaps this is because it is 15 per cent of the grain ration of laying hens through the winter. Fenugreek is sometimes used as a poultry tonic but I have never heard of its being made a part of the regular ration. Perhaps this is because it is usually expensive, but I should want the opinion of some one who had used it in this way before trying it.—J. A. K.

Permanent Bordeaux

Last fall I gave all my young trees a coat of Bordeaux paste with very good results as I have had but little gumming this year as compared to the previous year. However I find the paste as used does not last long on the trees, in fact, was about all washed off of many of them by the rains. I would like to ask if in your opinion it would be considered advisable to add to the paste formula a little cement or glue to make it last longer. If the glue should be used, about how much, and would the prepared article be best, or otherwise?—Subscriber, Exeter.

Prof. H. S. Fawcett answers:

"I would not advise using glue or anything of this nature in the Bordeaux paste as I would be afraid that it would tend to seal up the pores in the bark and might possibly cause injury. I find that when the Bordeaux paste is made with good caustic lime that has not previously been allowed to air-slake, it lasts much longer than when made up with poor lime. Even though a greater part of it appears to be washing off, its effect often lasts longer than one might think from appearance. I believe it would be better on heavy soils, where it seems advisable to use the Bordeaux as a preventive, to repaint the trees every year or so, rather than attempt to use anything to make it stick longer.

Cowpeas, Soy Beans, Sunflower Seed, etc.

A poultry expert wishes information as to possibility of growing cowpeas, field peas, soy beans, fenugreek and sunflower seed in the San Joaquin Valley without irrigation. This question was referred to Mr. Guilford, who replies:

"It is difficult to answer the question about growing crops without irrigation without knowing the particular locality and the sort of land that is to be used. There are many places in both the Sacramento and San Joaquin valleys where soy beans, cowpeas, sunflower seed, corn and other crops good for chicken feed are grown without irrigation. Rich soil that can be worked soon after the rains and that is deep and retentive of moisture will produce well if the crop is planted early and if the seed bed is well prepared and the crop is cultivated so as to conserve winter moisture for the use of the plants. There is much soil like this and there is much more, sometimes within a short distance of the good soil where summer crops are a failure without irrigation.

Spider on Bean Leaves

A subscriber sends leaves of lima beans showing yellow and even reddish spots on them as if attacked by a fungus. They were forwarded to Prof. Fawcett, who writes that he could discover no fungus and submitted the leaves to Prof. H. J. Quayle who finds that they are seriously affected with mites, probably the ordinary red spider mite. Where leaves are infested as badly as this it is probably too late for any effective treatment but if taken earlier in the attack spraying with dry sulphur mixed with hydrated lime would probably have effected a cure.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Examine Mouth

Have a calf about two months old that when chewing its cud, instead of swallowing each time as it should, a slimy green fluid with offensive smell runs from its mouth. We feed milk twice a day with a handful of bran mixed in it. Calf also has alfalfa pasture and plenty of water. Seems to have a good appetite and is in good condition. What is wrong?—Subscriber, Phoenix, Arizona.

Evidently there is something wrong in the mouth. Perhaps a loose tooth, or a barb or snag of some kind is sticking in the gums or roof of the mouth. Examine the mouth carefully and you will probably find the cause of the trouble and be able to remove it easily.

Fails to Breed

Our young Jersey cow has taken the bull now four times and apparent-

ly without effect except that the last time she refused. Her first calf was born February 25 and is large and healthy. Cow is in fine condition and has good appetite. Her next period will be September 4 or 5. Can anything be done for her between now and that time to improve her condition in that respect. Have been advised to use a certain patent medicine which is said to help in such cases. What do you think of the medicine?—Subscriber, Covina.

It may be that the cow is too fat or has too little exercise. Would advise that you reduce her feed and see that she gets plenty of exercise between this and the next time she is due to come in heat even if you have to drive her a few miles on the road. Also give her the following medicine: Get six ounces of tincture of iron and give her one ounce twice a week either in a little feed or by putting a dose in a bottle, adding a pint of water to it and giving it as a drench. Do not think much of the patent medicine you mention.

Feeding Dog

I write to ask for directions in regard to the proper feeding of a collie pup about three months old, also when fully grown.—Subscriber, Riverside.

The feeding of a dog is a mooted question. Ordinarily the dog is fed the scraps from the table and nine times out of ten is overfed. A starved pup will learn to steal but an overfed pup will get fat and sluggish. The table scraps are all right. A pint of milk with some bread in it is good. If it is necessary to prepare food for the dog make a cake of two parts corn meal and one part of flour mixed with sour milk, to which add a little salt and enough baking soda to offset the sour milk. Bake it until it is hard and crisp and feed a portion of it at night. A fresh beef bone with a little meat on it is always acceptable. Some people think that meat for a dog should be cooked, but nature says raw meat and they thrive well on it. Pups should be fed two or three times a day according to the amount of the exercise they get, and the largest meal should be given at night. Grown dogs do best on one meal a day and that always at night. The dog biscuits that are sold in the market are prepared of cheap flour, a little corn meal, meat broth and some scraps of meat baked very hard and kept dry until used. No set rules or amounts can be given, only be sure that the dog is not overfed. Many dogs suffer from lack of water. A place should be provided where they can help themselves to water when they want it.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115 1/2 N. Broadway, Los Angeles.

Trust Deposit

A makes a written request of the bank to consider his deposit as a deposit in trust for his sole use and benefit and checks to be cashed only on the O. K. of the cashier. In case of his decease what becomes of the fund?—Subscriber, Long Beach.

The trust made of the deposit is what is known as a dry trust and would be executed so that in case of the decease of the trustor the executor or administrator of the deceased would be permitted to draw out the

funds in the bank as the property of the estate of the deceased.

Pension to Soldier's Widow

Man filed interlocutory divorce against wife July 7, 1904. Neglected to get final papers filed until August 21, 1905, after marriage on June 20, 1905. Was the marriage legal? If it was not legal to remarry and the man did not know it, would that make it legal? If it was illegal is second wife entitled to claim for war pension?—Subscriber.

The parties were not divorced until the final decree was made, filed and entered; therefore a marriage contracted prior to the date of entry of the final decree was void, as there is no such thing as the common law marriage within this state. The only method by which the marriage could be validated would be by second marriage after the entry of the final decree of divorce, and it is very doubtful if the marriage being thus invalid the wife would be entitled to claim for war pension. (We believe a widow would not be entitled to pension unless married to a soldier prior to 1890.—Ed.)

the Cultivator Poultry Book

Poultry for Profit

by
Jean A. Koethen

PACIFIC POULTRYCRAFT SAYS:

A brand new book on poultry published by that old reliable Cultivator Publishing Co., Los Angeles. The author, Jean A. Koethen, has really written a poultry book worth while. The different subjects are treated with a directness that is refreshing, after reading so many books that say so much and mean so little. The book is intended for the beginner and farmer, but we commend it most heartily to anyone interested in poultry; whether for pleasure or profit; it is full of good things from cover to cover.

THE LOS ANGELES TIMES SAYS:

The author of this manual has covered the subject fully, giving the salient features and practices of an enlightened poultry culture as it applies to California conditions, based largely on personal experiences, and intelligent compilations from recognized authorities.

THE RIVERSIDE PRESS SAYS:

The Press is in receipt of a copy of this work, called "Poultry for Profit," and has no hesitation in commending it to either the "backlotter" who keeps a few chicks for his own pleasure, to the fancier who works to the "standard," and to the commercial poultryman who makes a business of poultry culture. Before its publication, the manuscript of "Poultry for Profit" was submitted to practical poultrymen, to experts and simple poultry enthusiasts, and all agreed that it was more comprehensive, more readable and vastly more helpful than any similar poultry book yet published. It covers the widest range, discussing breeds, feeds, diseases, housing, marketing and answers the thousand and one questions that even the expert poultryman sometimes has to ask and the amateur is ever asking.

THE PORTLAND OREGONIAN SAYS:

The Weekly Oregonian takes pleasure in recommending this book to its readers, for it is "the right stuff," told in the right way by the right woman.

"Poultry for Profit"

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

An outline of its valuable information—

Making a Beginning	Housing and Yarding	Incubation
Brooding	Feeding	Breeding
Marketing	Sanitation and Hygiene	Fixtures, Conveniences
Diseases and Vices	Ducks and Geese	Turkeys

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 13 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

\$1.00 Postpaid to any address.

\$1.75 with the California Cultivator, weekly, one year.

The Cultivator Publishing Co., Inc.

Los Angeles, Cal.

The Household Department

AT BEST

The faithful helm commands the keel,
From port to port fair breezes blow,
But the ship must sail the convex sea,
Nor may she straighter go.

So, man to man, in fair accord,
On thought and will, the winds may wait;
But the world will bend the passing word,
Though its shortest course be straight.

From soul to soul the shortest line
At best will bended be;
The ship that holds the straightest course
Still sails the convex sea.
—John Boyle O'Reilly.

MOTHER

Written for California Cultivator
by J. H. P.

THE woman laid the dress across a chair near-by. A strange apathy seemed to steal over her as the fingers loosened their hold on the finished work.

In the open doorway appeared a bright, girlish face, and an eager voice exclaimed:

"O mother! You did get it done, and in time, too!" I'm all ready to put it on."

The woman, leaning back in her chair, hands clasped listlessly in her lap, watched the girl but offered no help. She was not even thinking of the new dress.

"Look, papa," said the girl as a man came through the doorway, "isn't it pretty? A new dress out of two old ones. No one but mother could have done it."

"That's a fact," was the hearty response. "It takes mother to make something out of nothing."

The woman listened dully, the words filtering slowly through her tired brain. It seemed that all her life she had been doing what they implied. Tonight the truth jarred upon her.

"I will put the boys in bed before we go, Mary," said her husband. "You seem all tired out."

"Yes, and I will straighten up the room," said happy, thoughtful Marian. "You just sit still and rest, Mother."

Mechanically she watched their movements.

At last the home was quiet. The younger children were in bed, the husband and daughter gone to the evening's entertainment in which each had a part.

Closer to the fire the woman drew her chair. Long she sat there motionless. The room was in shadow save the firelight from the open grate. In the farthest corner of the room, where the shadows met and blended, a somber form seemed to emerge, to pause irresolutely and to beckon. Over by the fire the woman shivered. Then slowly she raised her eyes from the coals and looked, unwillingly but steadily, into the corner. She grew very calm, though her deep, deep eyes questioned earnestly.

"Well?" at last her heart murmured low.

"I have come."—Silence in the hushed room—"This is the end."

Was that the soft rustle of the wind through the trees, or did the shadow speak? Steadily the woman looked,

quietly she answered as by the breath of a thought.

"Yes, I know. That is the way my mother went." She felt the life blood ebb slower and still slower. Then her thought began to quicken just a little.

"The end?" she murmured, "and is this all?"

She stirred uneasily. "I had meant to do so much," apologetically. "My work is not finished. Must I leave it? Is this really all?"

From the shadowed form came the faint echo, "All."

"I am very, very tired," she muttered. "If I could only rest."

A reverie stole upon her, wrapping her close and warm. She must think a little. What had she done that was worth while?

Her childhood, happy and innocent. Her girlhood, a conquering one, wrestling success from stubborn odds—the support of her mother and sister. Ah, that had been worth while. Then her marriage—life in a new country—the clutch of discouragements and failures. Slowly her thought trailed through the last 15 weary years. Despite everything they had won! Rather, her indomitable courage had won. "Cannot pay? we will go without," had been her constant watchword, her talisman. With ingenuity and skill taxed to the utmost they had won. "Something out of nothing?" No note of praise in the words tonight, only a strange mockery. Out of nothing? Oh no! out of the costliest fabric of all. Her own strength and vitality had gone to pay the debts of these years. Recklessly, thoughtlessly she had mortgaged herself.

Now the sheet was to be balanced. The account was to be closed. This was the end.

The woman stirred uneasily. She turned away from the shadowed corner and questioned the coals mutely.

"What will they do without me?" A little faster pulsed the blood, propelled by the thought. All the work she had been doing, the thoughtful, loving care, who would give it now? How would they plan now?

The endless order of work, week after week, day after day, rose from the coals and comforted her. First, the washing. How weary of late she had been, how the Mondays had chased each other, giving her no time for rest between. True, her husband had lately urged buying a good machine and having a power plant, but she had swept the suggestion away with the old plea of not being able to afford it, completely forgetting the human machine that could not be replaced. But now, oh yes, now, he must plan everyway to save Marian's slight frame from too heavy a task.

And the sewing? No one else would contrive and save as she had done. It was out of the question. Ready made clothing? Or a woman to sew by the day? On and on her mind sped, planning each detail of their life to be, the life when she would not be with them.

Suddenly she roused herself. What about the soul life? Who would care for that? Marian was just budding into young womanhood. She needed her mother more now than in babyhood. Oh, who would watch the young feet

and tenderly point out the right path? Who? who?

She half turned and looked accusingly at the now shrinking figure in the corner.

And the two little boys—what temptations might now come to them, when her counsel was hushed?

Her husband—how young and handsome he had seemed of late! The burdens that had sapped her very heart's blood, had slipped from his shapely shoulders.

Why? why?

Money to do all these things afterwards? Then there was money now. She was not old. Forty-five was not old. She ought to be young and strong and happy. She must be. She would be!

Pleading hands were held out, the life blood coming now with throbbing flow. Oh, she would laugh and play again. She would save her strength—she would rest—and rest—till all the weariness fled. Dared she hope?

Her eyes were shining with the eternal love of motherhood, her lips parted in a smile of hope, as eagerly she awaited the answer. Was that the tree against the pane? Or did the fading figure echo the word, "Perhaps?"

The coals had died out, the ashes lay cold and lifeless on the hearth when the husband and daughter returned. Coming into the room they found her—asleep in her chair. And over her face was drifting still the radiance of the smile.

CARE OF THE BABY IN SUMMER

A baby may be made uncomfortable and restless by various causes which are readily removed. Babies and young children frequently suffer from a thirst. They should be offered a drink several times a day, and particularly in hot weather. When a baby cries in the night a drink will often quiet him and send him to sleep.

Irritating clothing is at times responsible for the baby's fretfulness. Woolen socks or shirts or stiff cap strings are quite enough to spoil his comfort, even if he is well, and in hot weather especially a superabundance of clothing is frequently responsible for much real suffering.

Dress the baby in the lightest cotton garments and keep him as cool as possible. Do not be afraid to let him have nothing on but his dlap and one other thin garment on the very hot days.

Prickly Heat

One of the troubles from which a baby often suffers in summer is prickly heat. This ailment appears as a fine red rash usually on the neck and shoulders and gradually spreads to the head, face and arms. It is caused by overheating, due either to the hot weather or to the fact that the baby is too warmly dressed. The rash comes and goes with the heat and causes intense itching. The remedy for it is to take off all the clothing and give the baby a sponge bath in tepid water in which common baking soda has been dissolved. Use one tablespoon of soda to two quarts of water. Use no soap and do not rub the skin but pat it dry with a soft towel. After the skin is thoroughly dry dust the inflamed surfaces with a plain talcum powder.

This ailment, like all others, is more readily prevented than cured. Frequent cool baths, very little clothing, simple food and living in cool rooms or in the open air will probably save the summer baby from much of the

annoyance of prickly heat and other serious ills.

Chafing

Fat babies are very apt to suffer from chafing, especially in hot weather. It appears as a redness of the skin in the buttocks or in the arm-pits, or wherever two skin surfaces persistently rub together.

Much the same treatment is required as in prickly heat. Never use soap on an inflamed skin. Instead use a soda, bran or starch bath. Directions for these baths are given in a publication called Infant Care, which may be had free of charge by addressing a request to the Chief of the Children's Bureau, United States Department of Labor, Washington, D. C.

IDEAS FOR THE COOK

Written for California Cultivator
By Isabel Cottle

Breakfast

Blackberries Cream
Corn Cakes Broiled Ham
Peach Butter
Coffee

Lunch or Supper

Cream of Corn Soup
Cheese Souffle Lima Beans
Watercress Salad
Nut Bread Baked Pears
Tea or Milk

Dinner

Beef Loaf Potato Pancakes
Spinach, Butter Sauce
Pineapple Ice Drop Cakes
Coffee

Corn Cakes

Make a custard from two eggs well beaten, one-half cup milk, one-half tablespoon shortening, and one-half tablespoon sugar; beat into this three-fourths cup of canned corn. Sift together twice seven-eighths cup flour, one tablespoon (level) baking powder and one-half teaspoon salt. Beat into other mixture and drop in greased muffin rings set in greased dripping pan. Bake in a moderate oven until done.

Beef Loaf

Mix together three pounds chopped raw beef, one-fourth pound minced salt pork (or a piece of chopped suet), one cup finely crushed cracker crumbs, two teaspoons each of salt and pepper. Moisten with two beaten eggs, a teaspoon each of onion juice and Worcestershire sauce. Work in two tablespoons melted butter and pack in a greased mold. Cover, set in a roasting pan of boiling water and cook in a steady oven for two hours. Serve with brown sauce.

Cheese Souffle

Put in a double boiler one cup of milk, one cup of grated American cheese, a tablespoon of butter, one-half cup of soft bread crumbs, one-quarter teaspoon salt, a little paprika and mustard. Cook for three minutes. Take from the fire and pour on the beaten yolks of three eggs. Fold in the beaten whites and turn into a buttered pudding dish; bake from 20 to 25 minutes in a slow oven. Serve immediately.

Potato Pancakes

Peel six potatoes and allow to soak in cold water about two hours. Grate and mix with them one large onion, also grated, two eggs, one-half teaspoon baking powder and enough flour to make a thin batter. Fry in cakes until a deep brown.

Screw-eyes placed in the tops of handles of brooms, brushes and mops, so that they may be hung on hooks in a closet, will allow a neater arrangement of cleaning utensils.

HELPS IN THE KITCHEN

Written for California Cultivator

By Martha

Make your old discarded newspapers serve you as labor savers, then burn the papers. Cover the table with papers before preparing a meal and wipe out all greasy dishes and pans with paper before washing them. The stove can be kept bright by rubbing off with soft paper after each meal. Mix stove polish with very soapy water and add a little turpentine and a little coffee, as it greatly improves the luster and prevents burning off. If the flue of the kitchen stove is choked with soot it can be loosened by throwing a piece of zinc on a hot fire and closing the lids.

A box or bucket with a cover is the only safe place in which to keep matches out of the way of children and mice, and unless they are kept in a safe place they may be the cause of a serious fire.

To clean cooking utensils that have burned, put in about a quart of wood ashes and boil thoroughly, then wash with hot suds. There is nothing better for cleaning steel knives or the steel of the range than wood ashes moistened with kerosene.

Here are two good ways to make sticky fly paper: Mix equal parts of rosin and castor oil, add a little sugar and spread the mixture on heavy paper, leaving a margin for handling. Or mix a cup of molasses and a half pound of glue and spread this on the paper.

To have good coffee, it is of the greatest importance that the coffee pot be kept perfectly clean. To cleanse the pot thoroughly boil in it for half an hour each week a strong solution of borax and water with a few shavings of soap added, then rinse out with clear hot water and place in the sunshine with the lid open. Keep the tea pot clean in the same way.

Fly paper and screens will help to keep flies out of the kitchen, and you can get rid of them almost entirely by breaking up their breeding places. This can be done by sprinkling a little powdered borax in the garbage can every day and by sprinkling a little of the powder where the can is kept and in any place around the house where slops have been thrown. While borax will not kill the adult fly, it will prevent all fly eggs from hatching.

It is a good plan to keep a strong borax solution in the kitchen, prepared by melting a bar of soap and then stirring in a heaping tablespoon of powdered borax and keeping in a closely covered fruit jar ready for use, as this soap is excellent for washing dishes and for keeping the tea towels soft and white.

A good mixture to set color in cotton material is one teaspoonful of turpentine, a handful of salt and a pail of cold water.—Washington Herald.

EASY TO GUESS

Vera (8 years old)—What does Transatlantic mean, mother?

Mother—Across the Atlantic, of course. But you mustn't bother me.

Vera—Does "trans" always mean across?

Mother—I suppose it does. Now, if you don't stop bothering me with your questions, I shall send you right to bed.

Vera (after a few minutes' silence)—Then does transparent mean cross parent?

HAY

Under date of August 21, 1915, Scott, Wagner & Miller say:

Receipts of hay for the past week were 3913 tons, about the same as last week. This is quite a reduction from the receipts of a few weeks back. Arrivals have sold to good advantage and have moved readily. With the dropping off of the receipts, it is generally conceded that an advance in price can be looked for, especially as there is a decided firmness to the market.

Export trade has been good and has taken large quantities for foreign markets. At the present time a large steamer is loading a full cargo of several thousand tons for Australia. This in connection with regular export business to Hawaii is bound to have its effect on this market.

The harvest is nearly over and it is noted that the alfalfa crop in the interior is much shorter than was anticipated. This will no doubt have a bearing on the price of grain hay throughout the season as feeders have been using a good percentage of their feed from the alfalfa crop, which will probably be the same price as grain hay.

The straw market continues without interest and offerings of this commodity are hard to place.

We quote the average wholesale price of hay in carload lots on today's market as follows:

Fancy Wheat Hay (lt. bales)	13.50@14.50
No. 1 Wheat or Wheat and Oat	11.50@12.50
No. 2 Wheat or Wheat and Oat	8.50@10.00

Citrus Fruit Market

LOS ANGELES, August 25, 1915.

The Valencia market still continues very good, sales running from \$4.75 to \$5.40 for good stock and demand is excellent. Shipments, however, are very light.

There is no change in the lemon situation; the weather in the East continues very cool, with much rain, and until the weather changes there is no chance of better prices. Foreigners are also being received in heavy quantities.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914, 31,108 cars, lemons 5957, total 37,165. Last season same date, oranges 35,370, lemons 2638, total 38,008. From Tulare County to date, oranges 5649, lemons 202, total 5851. Last year same date, oranges 5875, lemons 31, total 5906. From northern counties, oranges 630, lemons 2. To same date last season, oranges 404, lemons 5.

NEW YORK, Aug. 23.—Twelve cars Valencias, six cars lemons sold. Market is firm on both oranges and lemons. Weather fair.

THE SCIENCE OF AGRICULTURE

By John Bayard Coulter in Kansas' Industrialist

Agriculture has become a science. In the past men found that certain things they did to plants changed them; some of these changes were improvements, and so the crops were improved. Nowadays men are finding out more than that. They are finding out why plants change. They are learning just what to do in order to get the results they want. They are learning how to breed plants just as they have bred horses and cattle. They are finding just what to do in order to make the fields yield more than they did before, and they are finding how to make farm plants grow where they never grew before.

It is the knowing why as well as how that makes agriculture a science. Success in farming depends very much on knowing why plants behave as they do; why the doing of certain things produces good results, and why the doing of other things produces poor results. Farms cannot be run best by rules alone. Each field is a problem in itself, and the farmer needs to know how to solve his problems for

himself. To do this he must understand the principles of plant life. He must understand the conditions which are most favorable to plant growth and learn to recognize what conditions are unfavorable to it. He must understand why it is that crop plants gradually poison the soil for themselves and why it is an advantage to change the crops. He must understand why plants of the clover family increase the fertility of the soil and why it is that deep plowing and frequent crumbling of the surface also increase it. He must understand the principles which should guide him in the choice of the seed which he plants. He must understand how to encourage that invisible plant life in the soil which helps his crops and how to combat that parasitic plant life above the soil which injures his crops by causing crop diseases.

IRRIGATION FARMING

"Irrigation Farming," a hand book for the proper application of water in the production of crops, written by Lucius M. Wilcox, editor of Field and Farm, published by Orange Judd Company, New York, at \$2.00. The Cultivator will be glad to secure the book for the subscribers at the above price or, including one year's subscription to the Cultivator, at \$2.75.

"Till and keep tilling" is the most potent axiom of the 20th century. I have depreciated shiftless methods as derogatory to the best success and have condemned the practice as inexcusable as the wanton waste of water itself. This is a most sensible declaration from the preface of "Irrigation Farming." Mr. Wilcox states that he has had 25 years' field experience in the handling of water and he shows the worth of his experience by the axiom which he so aptly quotes. Where dry farming is possible, or rather where irrigation farming is impossible, methods of dry farming aid in increasing our wealth, but vastly more wealth comes from irrigation. Unfortunately many irrigationists demand too much water and too little tillage and the result is ultimately soil destruction.

The various questions which come up in irrigation farming are most satisfactorily answered in Mr. Wilcox's book. It comprises 24 chapters and a glossary of irrigation terms. The chapters touch upon history of irrigation, its advantages, relation to soils, treatment of alkali, water-supply, canal construction, reservoirs and ponds, pipes, flumes, duty and measurement of water, methods of applying, field crop irrigation, garden and orchard irrigation, vineyard and small fruits, alfalfa, windmills and pumps, devices and appliances, subirrigation and subsoiling, seepage and drainage, electricity in irrigation, irrigation in humid climates, winter irrigation, law of irrigation, etc.

There are more than 100 helpful illustrations in the book.

ADVANTAGE OF A FOREST COVER

We have a letter from Mr. Franklin H. Heald of Oak Grove Valley, San Diego County, in which he severely criticizes the attitude of the national

forest service in maintaining a cover over the mountain slopes in California. He writes:

"True, the greatest asset of Southern California is its water supply but I think I can show any thinking person that if this water supply is to be conserved its watershed must be free from a covering of brush and other worthless growth which robs it of its moisture. A piece of land which does not raise a crop of weeds or grain or brush will remain damp all summer, especially if harrowed two or three times, but if it raises a crop of weeds, brush or grain the moisture is all taken out of the ground. Especially is this true in the case of brush which is not cultivated."

We are compelled to take exception to Mr. Heald's claim that the loss from growth on mountain sides is greater than the value of moisture conserved. It must be admitted that growing vegetation on the mountain-side causes loss by evaporation, it also must be admitted that it causes much less evaporation through shading of the soil, but the one great saving from growth on watersheds is due to dead leaves and mulch preventing the rapid run-off which always follows a burned hillside. The burning off the growth of our mountains, much of which has been due to carelessness, is nothing short of criminal and must be discouraged in every way, for if the millions which come to California from the sale of her oranges and other fruits are to be continued her watersheds must be protected. Doubtless there are cases where lands adjoining these reserves are injured because such places harbor pests which destroy some crops, but the greatest good to the greatest number demands the maintenance of hillside coverings.

"Creeping Grip" Tractor of General Utility

Tractors of moderate size are proving their great utility and giving good results to the grain rancher as well as to the bean and beet grower. The Bullock Creeping Grip Tractors, equivalent of six to eight horses on soft ground, are delivered to Southern California ranchers for \$1100.00, freight paid by Bullock.

How would you like a Tractor that will do your plowing with 3 14-inch bottom plows, operating on cheap fuel, No. 1 distillate, consuming one and one-half gallons per hour and during that hour plow one acre? This performance may be a gauge to you of other work that may be performed with this Bullock Creeping Grip Tractor that sells for \$1100.00.

The purchase of this moderate size Tractor will prove a profitable investment. The first cost is less than the equivalent power in horses; the operating expense is far less than the horse equivalent and no expense is entailed while idle.

The "Creeping Grip" has that oscillating feature combined with a perfect balance that enables it to traverse rough, uneven ground, and at all times maintain its grip. The traction is perfect, there is no slippage.

On exhibition in Los Angeles.

EXPOSITION

\$675 Mogul 8-16 \$675
Oil-Burning Tractor

HOW well you know it! "The average farm does not possess sufficient power to do the plowing at the right time and to the proper depth." Consider the many times you have lost patience with sick horses, sore shoulders, bad weather.

Use your horses for the work they are fitted for. Plow, disk, harrow, seed, and harvest with a Mogul 8-16 oil-burning tractor. Then you can plow at the right time and as deep as you please.

After a season's experience with a Mogul 8-16, one farmer wrote us these memorable words, "It is the greatest one-man, efficiency tool I know of. With it, one man is equal to several teams and a gang of men. 'Let the tractor do it,' has become our farm slogan."

When the farmers of this country appreciate all that a Mogul 8-16 will do, and the low cost of using it, there will be easier times for men and horses, and more work done, on thousands of American farms.

Mogul 8-16—The Small-Farm Tractor for All Farm Work—is delivered to you for \$675 cash, f. o. b. Chicago. Get posted on this wonderful little machine. Begin now to "Let the tractor do it" on your farm. Write us for full information.

There's a
bunch of joy
in every
puff of
Prince Albert
tobacco!

Copyright 1915
by R. J. Reynolds
Tobacco Co.

YOU don't have to call for an encyclopedia to find out how P. A. sets on your taste! You just open up your supply, fill your old jimmy pipe or roll a makin's cigarette, strike a match—and puff away! Because, you have struck tobacco happiness on the first bound—and you're set for the future on the smoke question. The patented process fixes that—and cuts out bite and parch!

PRINCE ALBERT

the national joy smoke

among tobaccos is like a real man among men. You can make camp with it on short acquaintance! And get mighty chummy with it because you know from the first few puffs that P. A. is right!

Gentlemen, here is the friendliest smoke a man can put in his pipe or roll into a cigarette. We know, *men everywhere* know, and *you'll know* that what we tell you is government-bond-good just as soon as you prove it out in your pipe or cigarette! We tell you our printed word has never yet struck within 50% of what P. A. will produce in tobacco satisfaction for you!

Prince Albert is sold everywhere in toppy red bags, 5c; tidy red tins, 10c; handsome pound and half-pound tin humidors—and that fine crystal-glass humidor with sponge-moistener top that keeps the tobacco in such splendid trim!

One Dollar Yearly

Cover Crop as Soil Renewer

R. S. Vaile of the Riverside Citrus Experiment Station Writes of Experiments Which Have Been Conducted for Several Years with Various Green Manure or Cover Crops. Valuable Information Regarding This Method of Making Soil More Productive

CONSIDERABLE attention has been given in these columns and elsewhere to the results to date of the fertilizer and covercrop experiments conducted by the experiment station at Riverside. There is one comparison which has not so far been made in print between blocks fertilized in various ways but clean cultivated and blocks on which winter leguminous covercrops have been grown. The present appearance of the trees on these blocks growing green manure crops is so strikingly superior to that of the clean cultivated plats that we feel justified in drawing certain definite comparisons between them. Most of the readers are familiar with the outline plan of the experiments on the station grounds. For the benefit of those who are not we would say that a certain number of trees of the various varieties, Navels, Valencias, and Eureka and Lisbon lemons, are grouped together in a single block with a guard row surrounding them. All of these various plats are cultivated and irrigated exactly alike, the only difference being in the method of fertilization.

The plats which we will compare have been treated as follows from the standpoint of fertilizers.

Plat A has received nitrogen, phosphoric acid and potash every year since the trees were planted. During the seventh year this plat received 1.35 pounds of actual nitrogen from nitrate of soda, blood and bone, 2.75 pounds phosphoric acid from bone and 1.35 pounds potash applied in the sulfate form.

Plat B has received no fertilizer of any sort since the trees were planted.

Plat C received in its seventh year 1.35 pounds of actual nitrogen applied in the form of blood.

Plat F received stable manure only, at the rate of 6½ cubic feet per tree.

Plat O received 6½ cubic feet manure and 5½ pounds raw rock phosphate per tree.

Plat U received 4 cubic feet manure, raw rock phosphate and has had a leguminous covercrop grown every year.

The yields for the seventh year show very strikingly the advantage of the addition of organic material to the soil. Both in oranges and lemons the plats with the covercrop are far better

in total yield and in percentage of first grade fruit than any of the other plats, and coupled with this, the percentage of treeripe fruit is very much smaller in the case of lemons. The following table shows the yields for the seventh year together with the percentages showing various commercial grades. Coupled with the results obtained on these different plats is the fact that

covercropping with a leguminous plant is far and away the cheapest method of adding organic matter and nitrogen to the soil. We will not attempt at this time to point out the reasons why these results follow the use of a leguminous crop, but we feel that the results themselves are striking enough to be called to the attention of orchardists in as wide a way as possible:

Sacramento Valley Potato Notes

Written for California Cultivator by W. S. Guilford

GOOD many potatoes have been grown in the Sacramento Valley north of the delta section this season.

Some were planted early, made a good crop and sold for a good price. Others were planted later and because of the late rains and the cool, backward spring made a good crop, but came into the market after prices had dropped, and sold for about one cent per pound instead of three or four as the early crop brings. And other fields were planted so late, April and May, that the tubers did not develop satisfactorily in the hot soil. They were of poor quality and almost unmarketable for anything but hog feed.

I know of one small lot that was planted in February in sandy river bottom land, whole seed being used, and potatoes big enough to use were

dug from the patch 60 days later. These were Early Rose. They were not all dug then but continued to increase in size for some time. The seed came from Oregon and was very free from disease. I never saw finer looking plants.

For the early crop early planting is imperative. Some lands cannot be worked early enough to make potato growing a wise venture one year with another.

There was considerable damage from wireworms and some of the late potatoes were shriveled by the heat before they were dug.

An uneven moisture supply made other lots of late planted early potatoes very warty. The moisture content of the soil must be ample for the needs of the plant at all times or uniform development cannot be expected. A careful potato grower is con-

stantly digging in the soil to see what the moisture condition is. A soil may look somewhat damp and yet be too dry for the best development of the plant. One test for moisture is to compress a small quantity of soil in the hand. If it stays firmly in place it is generally moist enough, if it crumbles down as soon as the fingers are taken away it is altogether too dry. A soil may just barely stand moulded to form and yet be too dry. Judgment is required in making a simple test like this. Experience soon shows the right amount of moisture. Another good test is the color of the plant. If the leaves are a healthy, medium green the supply is generally ample; if a blackish green it is becoming too dry; a light yellowish green indicates too much moisture.

Potatoes saved from the early crop will be planted for the late crop soon.

I saw one lot planted in July, the seed taken from potatoes just dug. The soil has been very hot and they have not yet come up.

This bears out E. H. Grubb's belief that it is necessary for the potato to go through a resting stage before being planted again. He thinks the best results will come from the use of seed grown at a northern latitude or a high altitude and held in cold storage for the summer planting.

An ample supply of moisture must be provided for this late crop; in most cases this can probably be done by one or more thorough irrigations before the crop is planted.

Where to market potatoes grown in the upper Sacramento Valley is a problem that has not been solved, aside from supplying the local markets.

The ELECTRIC SIDE OF THE FENCE

is the side where the corn is *big* and the labor *little*.

G-E motors driving irrigation pumps mean *big* crops.

G-E motors driving farm and dairy machinery mean *little* labor in handling the big crops.

G-E motors will last a lifetime, give you no trouble and prove your most profitable investment.

A G-E motor will do the work of six men at less cost than the wages of one. Its first cost is less than one-third that of a good horse and it will do more than eight times the work in a day.

Booklet No. 3166 will show you how G-E motors will *increase your profits and lessen your labor*.

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps
These Deep Well Turbine
Pumps Are the Very Best
Pumps Made for the Purpose—
They are Dividend Earners,
Not Expense Makers

UNFERMENTED ORANGE AND LEMON JUICES

Written for California Cultivator
By Professor W. V. Cruess, University
of California

TO many people the various drinks appearing on the market as "orangeade" are orange juice. "Orangeade" is nothing more than a cheap artificial drink made up of citric acid, sugar, artificial color, and orange oil as flavor. Real orange juice must compete with the "orangeade" in quality; it cannot compete in price.

A genuine orange juice of much better quality than the artificial product can be made from cull oranges, but as yet the flavor of the true

it can be crushed and pressed in the same way as apples. It is estimated by those who have peeled oranges that it costs about \$5 per ton to hand peel. The peels can be used for oil to offset cost of hand peeling. Experiments are now being conducted at this laboratory on peeling machines. The results are not complete enough for publication, although one type of machine seems very promising.

The juice may be strained to remove pulp through a coarse weave bag.

Bottling Cloudy Juice

The juice may be put into bottles in an unmodified cloudy condition, or it may be sweetened slightly by

One Type of Hand Power Bottle Capper.

orange juice has not been carried over into the finished juice perfectly. It can be put up in two forms, cloudy and clear.

Effect of Ripeness on Flavor

Experiments have shown that juice from fruit gathered at the beginning of the season will become exceedingly bitter a short time after pressing from the fruit. The juice is sweet when first pressed but becomes intensely and disagreeably bitter on standing. On the other hand juice from fruit towards the middle of the season and thereafter to the close of the picking period will not become bitter after pressing. These facts should be kept clearly in mind.

Expressing Juice from Oranges

No entirely satisfactory peeling machine is on the market. The juice may be extracted from the halved fruit as mentioned in a previous article on pomelo juice. Or the fruit may be sliced, crushed, and pressed in a cider or grape press, skins and all. Some oil gets into the juice by this method, and there is a very slight bitterness extracted from the white part of the skin. Juice extracted by this method is not so palatable as that extracted from the halved or peeled fruit. If the fruit is peeled

adding five parts sugar to each 100 parts of juice. This may be measured by volume conveniently.

A better method still is to blend orange and lemon juice in the ratio of about one part lemon juice to five parts orange juice. To this is added approximately seven parts cane sugar to 100 parts of the blend by volume. The lemon juice adds an agreeable freshness to the juice and the sugar seems to aid in retaining the fruit flavors.

Dark colored bottles are best, as they protect the juice against light. (Mr. Kingsbury of Relands, a pioneer in citrus juices, is responsible for this discovery.) The ordinary beer bottle or soda water bottle or grape juice bottle with their respective types of Crown, Goldy, or other reliable type of patent caps will be found satisfactory. (See article on pomelo juice, California Cultivator, May 20, on use of patent caps.) Ordinary bottles and plain corks previously boiled in water may also be used.

Use of Sulfurous Acid

The flavor of the juice is more permanent if a small amount of sulfurous acid in the form of potassium metabisulfite dissolved in water is added to the juice at pressing. About four

ounces of the potassium metabisulfite per 100 gallons is sufficient. This is 4-100 ounces per gallon. For home use it may be omitted.

Clarified Orange Juice

The simplest method of clearing the juice is to allow it to stand till coagulation of the yellow portion takes place. This will be 24 to 72 hours. The amount of metabisulfite recommended above prevents fermentation during this period. The juice can then be filtered very easily, through a paper filter or bag filter or other suitable type of filter.

A second method of clearing the juice is by filtration through a high grade of infusorial earth such as is obtainable under certain proprietary names in California. About six to eight ounces per gallon is mixed with the juice, and the juice is then filtered through any filter available. The earth causes coagulation or clotting of the cloudy material and renders filtration easy and complete. A high grade of clay must be used or a disagreeable flavor may result.

A third method of clearing is accomplished by grinding very finely about six to eight ounces of Spanish clay per gallon of juice. The clay and juice are agitated and mixed with the hands till a homogeneous muddy liquid results. Left to stand 24 hours, it settles clearly and the liquid will filter easily. The cleared juice may then be bottled as such or can be blended with a small amount of lemon juice and sweetened to taste.

Pasteurizing

Pasteurize in same way recommended for pomelo juice. (See California Cultivator, May 20, 1915.)

Lemon Juice

The lemons need not be peeled. Simply slice or crush and press out juice from whole crushed fruit. Add about five ounces potassium metabisulfite per 100 gallons of juice to prevent darkening and loss of flavor by oxidation. Clarify by adding six to ten ounces finely pulverized Spanish clay to each gallon of juice, working it up thoroughly into thin mud; allow it to settle 24 hours; decant off clear juice and filter sediment. Bottle and pasteurize as with pomelo juice. (See California Cultivator, May 20, 1915.)

The juice may be improved by adding ten parts sugar by volume to each 100 parts juice before bottling.

AVAILABLE PHOSPHORIC ACID

By R. R. Snowden

Reviewing your article on "Available Phosphoric Acid" in your issue of March 11 last, I wish to dissent from some of the conclusions reached by the author.

I feel quite positive that in the presence of carbonic acid, so universally present in agricultural soils, there can be no reversion of the water soluble and reverted phosphoric acid to the so-called insoluble form, for even with the powerful base, soda, this does not take place under this condition, but the farthest reversion is to the intermediate or "reverted" stage. That is, the product is di-sodium, corresponding to the di-calcium phosphate.

But even if the reversion should proceed to the so-called insoluble form of calcium phosphate, I hold that the usefulness of superphosphate is not thereby seriously impaired, for before reversion the soluble phosphate is distributed over the soil grains, and then presents a far greater surface for the action of the soil and plant root solvents. It is then precipitated in a condition of fineness that is not easy

to approach by mechanical grinding. Indeed it must be of molecular fineness when precipitated by the lime carbonate of the soil.

Furthermore I claim that the soil is not made acid by the application of superphosphate so long as any lime carbonate remains in it.

I also claim that gypsum does not render the soil acid. Its power to correct the strong action of sodium carbonate is due to the fact that the products of double decomposition between the latter and the gypsum are the neutral sodium sulphate and the almost insoluble lime carbonate.

I agree with and wish to emphasize some of the other statements of the author, however.

Twenty-five years ago the writer advocated the use of the "soft" phosphates of Florida without treatment with acid. The material, which is probably much finer than the rock is ever ground, is amply soluble in carbonic acid in the laboratory tests, and from experimental evidence on the farm this statement is abundantly verified. Some day this material will be brought in shiploads to this coast for agricultural uses, and doubtless would have been extensively used long ere this but for the adverse influence of the superphosphate manufacturers.

The author is quite correct as to the importance of the sulphur content of the soil since it is vitally necessary to the formation of albuminoids. In some soils I have found the deficiency of this element to be the limiting factor, decidedly curtailing fruit production.

The author is quite correct according to my experience, in saying that "thousands of dollars are annually wasted in blindly buying fertilizers."

KATYDIDS ON ORANGES

The department of agriculture is issuing Bulletin 256, a professional paper which we doubt not scores of Californians may secure by writing the department of agriculture, Washington, D. C. It is, "Katydid Injurious to Oranges in California," written by J. R. Horton and C. E. Pember-ton. The introduction reads:

"There are at the present time in the San Joaquin Valley of California over 43,000 acres of land devoted exclusively to the cultivation of citrus. The citrus strip lies along the Sierra foothills between Bakersfield and Fresno. Although some citrus trees have been grown in this area for more than 25 years, most of this great acreage has been planted in the last 15 years. The transformation of this strip of land from a semiarid grain-growing belt into an irrigated fruit-growing area has so changed the status of certain formerly obscure species of insects native to the locality as now to bring them into prominence as pests.

"One of the more important of these species is the fork-tailed katydid, Scudderia furcata Brunner. The amount of damage done by this insect has increased considerably since 1910, when it first came to the attention of the senior author. In 1912 it caused a loss in several orchards of a full fourth of the crop.

"Associated with the fork-tailed katydid in the orange groves and closely resembling it is the angular-winged katydid, Microcentrum rhombifolium (Sauss). This insect is also responsible for a certain amount of injury to orange trees annually, feeding voraciously, as it does, upon the leaves. It is, however, of much less importance than the former, and is

treated here rather because of close association with and resemblance to the fork-tailed katydid than on account of its economic importance. No distinction has heretofore been made between these two species in the orange groves of California."

The greater portion of the bulletin is given over to text and engravings touching upon the life history of these insects. The bulletin ends with the following:

"Recommendations

"On the basis of the foregoing results the writers make the following recommendations for the control of katydids on oranges in the San Joaquin Valley:

"1. Two applications of arsenite of zinc at the rate of 2 pounds per 100 gallons of water; or,

"2. Two applications of arsenate of lead at the rate of 4 pounds per 100 gallons of water.

"The first application should be made, at the latest, immediately after most of the petals have fallen; the second application, from ten days to two weeks after the first. If it seems desirable to spray for the citrus thrips also, lime-sulphur should be added to the above at the rate of 2 gallons per 100, and a third application of lime-sulphur only, at the same dilution, should be made about two or three weeks after the second.

"The cost of spraying will vary somewhat according to size of trees, cost of labor, team hire, insecticides, etc., but with ordinarily good management will not exceed five dollars per acre."

A DIFFERENT CASE

Visitor (consoling to Tommy, who has upset a bottle of ink on the new carpet)—Tut, my boy; there's no use crying over spilt milk.

Tommy—Course not; any duffer knows that. All you've got to do is to call in the cat and she'll lick it up; but this don't happen to be milk, an' mother'll do the licking.—American Boy.

VINE MILDEW IN 1915

By Frederic T. Bioletti

THE mildew, powdery mildew or Oidium of the vine, to mention its most common aliases, has been more prevalent and destructive this year than perhaps ever before in the interior valleys.

The agricultural college has made some experiments and observations during the present season that should be of interest to those vine growers who have suffered loss from this disease. While little or nothing useful can be done at the present season it is perhaps wise, while the damage is evident, to point out what seem the best methods of control.

The long accepted method of control is to dust the vines with sulphur during the growing season. Some growers state that they find this method useless or only partially effective. They instance cases where the vineyard has been sulphured five or six times without saving the crop from serious injury. An answer to this is that vineyards where the conditions are apparently identical have been saved completely by three sulphurings. They state further that serious injury has occurred in vineyards where 50, 100 and even 150 pounds of sulphur per acre have been used. In answer to this it can be shown that other similar vineyards have been protected perfectly by the use of 20, 15 and even 10 pounds of sulphur per acre.

If the facts are correctly stated on both sides they indicate that in some vineyards mildew is completely controlled by sulphuring at an expense of 50 cents to \$1.50 per acre and that in others, apparently similar, the expenditure of from \$2.00 to \$5.00 per acre for sulphuring does little good.

The cause of this difference in results appears to lie in differences in the time and method of applying the sulphur. In nearly all cases examined in which sulphur failed to control the disease the first sulphuring was done late in the season. In most cases examined in which sulphur was successful the first sulphuring was done early. In some cases the cause of failure appeared to be imperfect distribution of the sulphur. Sulphur of sufficiently good quality seemed to have been used in all cases.

The recommendations which it seems safe to make now with regard to sulphuring next year are:

Sulphur Early

This means when the foliage is sparse; when it is possible to see daylight through every part of the vine; when it is still possible for a bee to fly between any two leaves without touching them. This will be when the shoots are not over eight to ten inches long.

At this time a cloud of sulphur passing through the vine will leave a particle on every minute part of the surface. Later the older leaves will have grown so that many surfaces will touch. If the first sulphuring is deferred therefore many areas of surface will escape the sulphur and furnish places where the mildew can live

and produce spores to infect the new growth.

This first sulphuring should be done if possible in warm, dry, still weather. If such weather is not supplied by the weather bureaus, sulphur just the same. If the weather is very bad, re-sulphur in a week or ten days. These two sulphurings will together cost only half as much as a single sulphuring in July and be much more effective.

At or Before Blossoming

By this time the foliage will be dense in some parts; but these parts consist of the oldest leaves which have already been covered and protected by the first sulphuring.

When The Grapes Are as Large as Buckshot

In vineyards not usually much subject to mildew this sulphuring should be omitted. Later or more sulphuring will rarely be needed if these three are properly applied. For these late sulphurings it is usually best to wait until mildew appears.

Do Not Wait Until Mildew Appears

Do not wait till mildew appears for the first two or three sulphurings. Perfect control is possible only by preventive treatments. The idea in sulphuring should not be simply to kill the mildew; it should be to prevent its growth, multiplication and the production of spores. If we wait until mildew is found on the vines perfect control is impossible and even partial control is more difficult and expensive.

In the first two sulphurings do not miss a single leaf on a vine. This can be done with two to eight pounds of sulphur per acre, according to the size of the vine, if we use an efficient knapsack dust sprayer. With other means of distribution more will be necessary.

Use Only Finely Divided Sulphur

Coarse sulphur does not float in the air well, does not attach itself readily to the surface of the leaves and canes, and is easily shaken off by the wind or washed off by the rain. All the sulphur sent in by growers for examination this year was fair or good.

In short, to control the mildew of the vine, sulphur early, distribute the sulphur perfectly and use fine sulphur.

Comparative tests with other remedies showed that winter treatments are useless and other spring and summer treatments inferior to sulphuring. Some liquid sprays are recommended on the theory that they will control the mildew at the same time as the vine-hopper, the grape-root worm and similar pests. This is dangerous doctrine, as it leads to deferring treatment to so late in the season that control of the mildew has become impossible.

PACK CAREFULLY

California fruit growers and shippers have felt the necessity of reaching out to other countries to increase the marketing field. That they have done so to a considerable extent is evidenced by conditions at this time when many of the markets of the world are close, but many of us have yet to learn the lesson of packing. For instance, from a recent copy of re-

ports of the department of commerce we note the following written by the Consul General at Shanghai, China:

"I gave . . . of San Francisco, a large order last year and the packing

You want your harness to always look spic and span. Rusty-looking harness spoils the whole appearance of any horse and rig.

EUREKA HARNESS OIL

keeps your harness jet black, soft and pliable — just as it was when it came from the shop. Eureka preserves the life and color of the leather, saves repairs, makes the harness last longer. Have your harness man dip your harness in Eureka, or apply it yourself by hand. Dealers everywhere.

was execrable. They shipped bottled jams and extracts as they might perhaps have done for Oakland, and when the stuff arrived here in fragments I could get no satisfaction out of them. Naturally I am not repeating the order.

"When I have been on furlough in America and manufacturers or wholesalers have asked me what openings there might be in China for their goods I have always replied bluntly: Not any, unless you are prepared to consider the requirements of the market and pack for long-distance transportation, as European dealers do.

"Last winter I placed two orders of the same value for rose plants, one with a nurseryman in Ohio and another in England. The American plants were simply tossed into a flimsy pasteboard box with a little loose moss, so that the box arrived all crushed and the roses as dry and dead as the bones of an early Christian martyr. The English roots were tightly wrapped in moss, then in cotton, and finally in a gunny bag. It took them longer to reach me, but all were alive."

The United States consul at Karachi, India, writes referring to the need of American packers having a series of moving pictures taken showing method of handling freight in foreign countries, especially in India. He refers to the severe handling given to cases of fruit, sacks of flour, etc. For instance "If single photographs of a smashed packing case, or a lighter full of goods being landed, or other illustrations are good, a picture showing how the case came to be smashed or how the goods were put into or taken out of the lighter would be better. Everyone knows that cases are smashed and a single photograph shows only the result, which any shipper can imagine.

"If, however, a shipper of flour, let us say, could see a lot of Levantine stevedores swing a loop full of sacks over the side of the ship and let it down on the run to a flatboat bobbing about in the waves, the sight of what happens when the boat rises suddenly to meet several hundred pounds of muslin-sacked flour would be an education to the shipper.

"If an American furniture merchant could see a moving picture of his packing cases dropped from a cart tail to a stone floor by a gang of Maltese dockers, he would appreciate the cause and effect."

"DRAWBACK"

According to the story told by Mr. Frank True of the Los Angeles chamber of commerce to visiting delegates of the American Pomological Society on their way to the Berkeley meeting, California has one very great drawback. He said: "Eastern people often come to California expecting to find a veritable paradise. In fact, I am not in a position to deny that it is, but the ideas of some people in regard to paradise are often greatly exaggerated and, finding some features of California farm life which are not up to the standard, they become discouraged or rather disgruntled and return to the good old states of snow and sleet. With the first return of the blizzards of January and the slush of February and March and the half year of general misery when nothing but a grouch will grow, memories of good old California mountains and valleys redolent of wild flowers the year around, and the song of the meadow lark, come to the former homeseecker and he longs again for California. Then he is drawn back to become a

resident, and this is California's greatest 'drawback.'" Hearty expressions by members of this delegation coming to attend the 34th Biennial Convention of the American Pomological Society leads us to believe that California's principal "drawback" may get in its work with them.

The party arrived at the Needles during the warmest weather our state has had for some years, but as they neared the shores of the Pacific the weather was greatly tempered and they enjoyed the entertainment tendered by the chambers of commerce of Redlands and Riverside and were captivated by the beauty of the San Diego exposition. The three days following, with Los Angeles as headquarters, under the direction of Secretary Frank Wiggins of the Los Angeles chamber of commerce, the delegates were shown intensive cultivation as followed by orchardists near Pasadena, along the Foothill Boulevard to Pomona, and at Whittier. At the San Dimas lemon packing house methods of packing California lemons were fully explained by Manager Hosford. At the packing house of the La Verne Orange Association at Lordsburg Manager Arbuthnot demonstrated methods of handling and packing oranges, showing how the fruit is carried by gravity to the pre-cooling rooms, thence by carriers to the pre-iced car which takes it to markets 3000 miles distant.

A delightful luncheon at the Maryland Hotel was given visiting delegates by the Pasadena board of trade. At the reception in the rooms of the Pomona chamber of commerce in the afternoon fruitade was served. Several plantations of avocados were shown at Whittier, the visitors afterward being entertained with a luncheon at the Country Club.

Arriving at Riverside the delegates were met at the train and were taken directly to the new citrus experiment station grounds, past the Roosevelt Palm and out Victoria Avenue where orchard methods of the Arlington Heights section were inspected. Dr. Herbert J. Webber, at the head of the experiment station, gave a most interesting outline of an experiment now under way in connection with a 25-year-old orchard which had ceased to be profitable. This is being handled by the experiment station with the idea of determining the possibility of restoring a run-down orchard. When taken in charge by the station staff practically every tree in the orchard was affected with chlorosis, the ground was of a putty-like consistency, almost devoid of humus, and the trees bore practically no fruit. A series of experiments contemplate treating different plats with green manures, with applications of stable manure, with ordinary grain straw, alfalfa hay, commercial fertilizers, and various combinations of treatments, including clean culture the year around and mulched land without any cultivation. Which one of these methods will prove the best to restore these lands? It will take years to answer this question. As yet the first year has not passed but already material improvement is noted in many of the plats. Of course some of the experiments may cost more than the increase in crop will justify, but the point is to thoroughly investigate every method which offers a solution of the problem of restoring unprofitable citrus orchards to profit producers.

As we go to press the delegates are in session in Berkeley. The officers

of the association are: President, L. A. Goodman, Kansas City; secretary, E. R. Lake, Washington, D. C.; treasurer, L. R. Taft, East Lansing, Michigan. Mr. Geo. C. Roeding of Fresno is vice president for California.

BIRDS THE BALANCING FORCE

Through a predominating insect diet, and on account of exceedingly rapid digestion, the birds become the most indispensable balancing force of nature; without their assistance man with his poisons, the weather, and animals, as well as the parasitic predacious insects, would be helpless. The author then states how the bird is a benefit to man in a great number of ways; in checking insect invasions, in preserving forests and orchards, their service in the meadows and gardens, their value in protecting live stock, and their usefulness in the preservation of health and elimination of disease.

LIKE FLORA M'FLIMSEY

A Boston man, recently returned from Europe, complains that he was detained near Hamburg, Germany, for some time and had nothing to eat but sausages. Nothing to eat but sausages! That sounds very much like the kick of the man who has nothing to wear but clothes.—Philadelphia Inquirer.

THIS MONTH
Written for the California Cultivator
By O. M. Morris

ALL manner of gardening operations are in order this month, the first and most important step of all being thorough preparation of the ground, when we may proceed to plant all manner of hardy flowering plants for winter and early spring flowers. Bulbs for blooming at the holiday season should be put in. The Dutch bulbs will begin to arrive the latter part of the month but in the meantime we may plant Chinese lilies, freesias, daffodils and gladiolus. Hardy primulas may be sown under the shade of trees or on the shady side of the house. Especially satisfactory varieties of these are primula Malacoides and abconica. These have succeeded splendidly the past season, giving almost a constant mass of bloom for months. Make liberal plantings of winter flowering sweet peas at this time.

Among the hardy annuals and perennials for September planting are pansies, stocks, scabiosa, centaurea. The sooner these are planted the better. Cinneraria, calceolaria and plants of this class which have been potted off should be carefully watched and if the pots are becoming filled with roots they should be repotted without delay. Given the best of care for the next two months they should be ready to bloom for the holiday season.

This is the time to make selection of native flowers. Scatter freely in out of the way places, but if possible where hose may be used in case of drouth, at least some of the following:

Evening Primrose (Farewell to Spring) evening primrose family, deep rose-colored, sometimes with crimson blotches.

Godetia grandiflora, delicate pink, blotched with crimson.

Heuchera Hartwegii (Alum Root) saxifrage family, minute white flowers, handsome mottled leaves.

Layia platyglossa (Tidy-Tips) bright yellow, tipped with white, composite family.

Layia glandulosa, White Daisy.

Argemone platyceras (Thistle Poppy) white, poppy family.

Erigeron Coulteri (White Mountain Daisy) yellow and white, composite family.

Baeria (Sunshine) yellow, composite family.

Oenothera (Evening Primrose) yellow, evening primrose family.

Clarkia, rose pink, evening primrose family.

Penstemon Menziesii, pink.

Phacelia grandiflora (Baby Eyes) light blue to white, waterleaf family.

Phacelia Whitlavia (Wild Canterbury Bell) purple, waterleaf family.

Linaria Canadensis (Toad Flax) blue, figwort family.

Nemophila insignis (Baby Blue Eyes) azure blue, waterleaf family.

Collinsia bicolor (Innocence) lilac and rose purple, figwort family.

Salvia carduacea (Thistle Sage) lavender, white-fringed, mint family.

Platystemon Californicus (Cream-cups) cream, yellow spot at base, poppy family.

Violet pedunculata (California violet) yellow, violet family.

Floerkea Douglasii (Meadow Foam) yellow, sometimes tipped with white or rose-tinged, geranium family.

Emmenanthea penduliflora (Whispering Bells) straw-colored, waterleaf family.

Mimulus brevipes (Monkey Flower) yellow, figwort family.

Small Fruits

Vegetables

THIS MONTH

Written for California Cultivator
By O. M. Morris

THE planting calendar recommended for August may be followed this month with the possible exception of pole and lima beans. Since most of

the pole beans require a longer time to mature and are more susceptible to rust at this season than the bush varieties the latter are to be preferred. As for lima beans, excepting on hillsides in very favored localities these would not mature with any degree of satisfaction and even then they will not produce a profitable crop one year in five.

All the hardy vegetables, including beets, carrots, chard, endive, kohlrabi, kale, lettuce, onions, radish, spinach, turnips, cauliflower and cabbage may be planted. Nor is it too late to plant potatoes, though we would recommend planting old seed if it is possible to procure it.

In beans one may plant Canadian Wonder, Refugee, Early Valentine, Ventura and Black Wax. The earlier maturing or dwarf varieties of peas will be ready for the holiday season when vegetables are scarce and best prices are obtainable. Early maturing sweet corn will produce roasting ears in about seven to eight weeks. The best winter radish is the Japanese Mikado, which forms a root two inches in diameter and six to eight inches long. It is somewhat slow in maturing and should be thinned out in the row four to six inches apart to give opportunity for root development otherwise it will make heavy top growth without bulbing out. This is the mildest of all radishes and very productive.

Varieties of lettuce recommended for planting at this season are New York Wonderful and Iceberg. If a smooth-leaved variety is preferred we have the Big Boston, California Cream Butter and Bronze Top.

Best varieties of cabbage for the home garden are Copenhagen Market, or, still better, the Cannonball and Danish ballhead. The cannonball is the earliest cabbage grown, making a six to eight-pound head two weeks earlier than the Winningstadt, the small pointed head of which generally averages about three pounds so that on the same space one may grow eight-pound heads against three, and in less time, while the quality is unsurpassed.

Diplacus glutinosus (Sticky Monkey Flower) corn-colored to red, figwort family.

Mimulus Cardinalis (hardy perennial) scarlet, figwort family.

Leptosyne (Sea Dahlia) yellow, composite family.

Hypericum Concinnum (St. John's Wort) golden yellow, margin black-edged, St. John's wort family.

Mentzelia Laevicoulis (Blazing Star) cream-colored, blazing star family.

Delphinium Cardinale (Red Larkspur) orange, tipped with red, buttercup family.

Hunnemania (Tree Poppy) yellow, poppy family, and always, of course, Eschscholtzia, our state flower, the California poppy.

However the Copenhagen Market is a very fine cabbage about the same size as the Cannonball, with round head. It matures nearly one month later.

For early greens for the chickens or for the table we would suggest a liberal planting of Chinese Cabbage. This does not make a head in the sense of the American cabbage, being more of the nature of Swiss Chard, but it is the earliest to mature in the way of greens that we have, frequently making a head weighing ten pounds in from two to three months.

SALTPETRE FOR CABBAGE

An excellent poison for the troublesome cabbage worm, which usually makes the cabbage patch look quite ragged and unsightly, is an application of a liquid preparation, easily made.

Take a teaspoon of saltpetre and dissolve in about six quarts of warm water and allow to cool enough to prevent the heat from injuring the plants. Apply with a fine sprinkler or spray. It is surprising how hot water can be applied to cabbage without injury. Persons have been known to apply water that was hot enough to kill all worms and still the plant recovered and grew into a splendid head.

The saltpetre application is not only good to kill the worms but has a stimulating effect on the plant, inducing it to a more vigorous growth than those not so treated. It seems to reach the roots and give them a new life and the plants take on a new color and soon assume another appearance. It is thus doubly useful and is quite cheap. It is perfectly safe as far as any danger of poisoning the persons eating the cabbage is concerned.—Successful Farming.

It pays to grade strawberries. See that the boxes and the crates are uniform, even if a few boxes of poor fruit must be thrown away. The poor ones only reduce the value of the whole crate.

A mulching of well rotted manure is often put on canna beds about this time of the year. It keeps the weeds down and supplies plant food.

Cut out and burn the old raspberry canes as soon as they are through fruiting. Cultivate the young shoots and keep out all weeds.

Farm Bureaus

ANOTHER county of California has a farm adviser. Placer has just secured the services of Mr. E. O. Amundsen. His headquarters will be at Auburn in the offices of the county horticultural commissioner. We expect in a later issue to give announcement of farm bureau meetings in Placer County as arranged by Mr. Amundsen.

Cady, August 8; Fly District, August 9; Wood- en Valley, August 10; Soda Canyon, Directors' meeting at Napa, August 11; Carneros, August 13; St. Helena, August 15; Soscol, August 18; Rutherford, August 20; Berryessa, August 22; Pope Valley, August 24; Mt. George, August 25.

"Profitable Cattle Feeding" will be the subject discussed at these meetings and slides will be shown illustrating subject.

The Napa-Sonoma Cow-Testing Association directors at their meeting Wednesday morning, August 25, decided to commence testing September 15, as on that date more cows will be milking in the herds of this vicinity than during the first half of the coming month. After consideration of all applicants who have appeared before the directors, Mr. Hugh G. Asselstine of Humboldt County was chosen tester for the coming year. Mr. Asselstine is a graduate of the University Farm School at Davis where he completed the regular three-year course. He has had considerable practical dairy experience and recently engaged in official testing for the University of California. He has also carried on the herd testing at the University Farm, at Davis, and with the Panama-Pacific Dairy of Sutter Creek.

Bakersfield, Director M. J. Adams, September 25, 2 p. m.

Maricopa County, Arizona, James A. Armstrong, Adviser, Phoenix

Prof. S. B. Johnson, who has been helping the lettuce growers here has succeeded in germinating lettuce seed

in the open field during the past week, by covering the seed with a thin layer of manure and the application of water. Mr. Johnson recommends that the rows be planted east and west and that a small ridge be thrown up on top and the seed planted as above on the north side of the ridge. The purpose of this special treatment being to germinate the seed sufficiently early to head the lettuce for the early market which is usually very good. Another point in favor of mulching is in the fertilizer which would stimulate the young plant.

Subsoiling of alfalfa can be done for less than \$3.00 per acre. Results are immediate and permanent. With rent for alfalfa land at \$12 to \$15 per acre per year it would not take many bare spots to have the whole field subsoiled.

20% More Than Was Demanded Of It

W. H. H. Garver of Perris had the power problem to solve. Conditions on his ranch were rather difficult. After investigating in conjunction with his engineer the various makes of engines on the market he settled on two makes—the Commercial and the Commercial. After two months of effort the Company was unable to lift the amount of water required. Mr. Garver then installed a Commercial Gas Engine which not only met all of his conditions but pumped 20 per cent more water a minute than he had demanded. Write for Mr. Garver's full testimonial, and catalog 18-C.

General Agriculture

FARMERS' SHORT COURSES

T HERE will be four separate farmers' short courses at the University Farm, Davis, each beginning October 4, 1915. Three of these courses continue for six weeks, namely the course in general agriculture, the course in horticulture and the course in poultry husbandry. The course in

will be accompanied by practice work in common nursery methods, budding, grafting and top-working.

The third week will be largely devoted to the underlying principles of pests and their control. This will include studies of the types of insects and plant diseases which must be combated by the fruit grower and the methods used. Throughout the

Fat and Pure Breds for Demonstration

dairy manufactures continues for eight weeks. Each of these courses is designed to meet the needs of ranchers, dairymen, poultrymen and fruit growers, who do not have the opportunity of attending the more extended instruction in agriculture offered by the university. There are hundreds of persons in California, who, however efficient they may already be, could profit by attending the lectures and practice offered in one of these courses.

The first three weeks of the course

course a portion of the time will be given to the studies of soils, irrigation, farm management and farm machinery—topics of fundamental importance in all branches of agriculture.

The work of the fourth, fifth, and sixth weeks of the horticultural course will be divided in such a way that the student may secure detailed instruction concerning the type of fruits in which he is most interested by attending one of the three subdivisions: Deciduous fruits, citrus and semitropical fruits,

Studying Principles and Practice of Buttermaking

in horticulture will be devoted to a consideration of topics fundamental to all branches of the subject. This work will include a thorough study of the fundamental principles of plant propagation and nursery methods, the pruning of fruit plants and the selection and preparation of lands for fruit plantations. Attention will be given to the basic features of successful marketing. This will involve studies in fruit handling, pre-cooling and storage, together with a consideration of the essentials of cooperation and marketing methods and agencies. This work

and viticulture. Similar detailed instruction is given in general agriculture, poultry husbandry and dairy manufacturers.

From letters of criticism and of commendation for these short courses we quote:

"After I returned home and told the neighbors some of the things I learned they expressed a desire to attend if they could only get off. Six of my neighbors are feeding their calves a grain ration I learned.*** They are all profiting by it. I am feeding a bull calf a grain ration I learned

at the farm and at five months he weighed 394 pounds. *** I hope to be able to attend the dairy manufacturing course this year."

"Intending to settle in the country but having no experience whatever, we realized that many of the failures we heard about were due to lack of knowledge, so we wanted to learn something about what we were going to do before starting in. The six weeks' course in poultry husbandry and other subjects was very interesting and beneficial. We take every opportunity to recommend it but we are really surprised that so few know anything about it."

"It seems to me that each grange of this state should establish a kind of scholarship that would enable one of its younger members to attend a short course each fall. Even if half the expenses were borne by the organization, it would be a big inducement for some person to attend."

"I would suggest that you make the dairy course longer, as it really is too short a time to learn what we are supposed to in eight weeks. The course is fine for people that already were engaged in the dairy business before coming to Davis. I would not have missed the course I took for anything."

"Being city bred, I would suggest that you make the benefits of the short courses known to all who contemplate giving up a position to go to work on a farm. Professor Adams in his farm management lectures soon reduces "Country Gentlemen" dreams to hard work and no pay, unless you are above the average. I am very enthusiastic over the good I received in the short course."

FRESNO FAIR

Bigger premiums than ever before are announced for the Fresno District Fair to be held September 23-25.

Aside from a great number of special amusement features will be the staging of an outdoor play and pageant which the directors are prepared to spend \$15,000.00 to perfect. Following is the revised list of premiums in the different classes which will be offered this year: Divisions A and B, Horses, \$3,346.00; Division C, Cattle, \$3,170.00; Division D, Swine, \$870.00; Division E, Sheep, \$450.00; Division F, Poultry (if all classes fill), \$5,538.00; Division G, Apiary, \$110.50; Division H, Dairy \$516.00; Division I, Agriculture, \$450.00; Division J, Horticulture, \$924.00; Division K, Floriculture, \$675.00; Division L, Woman's department, \$860.75; Division M, Fine Arts, \$400.00; Division N, Educational, \$186.50; Division O, Oils and Minerals, \$150.00; Division P, Machinery and Vehicles, silver cup and diplomas; Division Q, Mercantile displays, silver cup and diplomas; Division R, Viticultural, silver cup and diplomas; Division S, Automobiles, silver cup and diplomas; Division T, better baby contest, silver cup and diplomas.

ARIZONA STATE FAIR

The Arizona State Fair, to be held at Phoenix, November 15 to 20, will be as big as ever. Directors have been appointed to the different departments which now number 23. The purses and prizes will total about \$80,000. This amount includes the prizes for the track events, auto races and all the other features of the Fair.

The office of the Arizona Fair is at Phoenix and the secretary is Mr. T. Shaughnessy.

COMING FAIRS
CALIFORNIA

No state fair will be held this year on account of the Panama Exposition.

Esparto Almond Festival, Esparto, Yolo County, Sept. 4.

Arbuckle Almond Festival, Arbuckle, Colusa County, Sept. 6.

St. Helena Vintage Festival and Napa County Farm Bureau Fair, St. Helena, Sept. 3-6.

Rio Vista Horse Show, Rio Vista, Sept. 9.

Merced District Fair, Sept. 23-25.

Fresno District Fair, Sept. 28-Oct. 2.

Riverside District Fair, Oct. 5-9.

Orange County Fair, Santa Ana, Oct. 12-16.

National Orange Show, San Bernardino, Feb. 17-24, 1916.

ARIZONA

State Fair, Phoenix, Nov. 15-20.

COLORADO

State Fair, Pueblo, Sept. 13-18.

Morgan County Fair, Ft. Morgan Aug. 31-Sept. 3.

Larimer County Fair, Loveland, Aug. 31-Sept. 3.

Crowley County Fair, Sugar City, Sept. 8-10.

Cheyenne County Fair, Cheyenne Wells, Sept. 8-11.

Logan County Fair, Sterling, Sept. 7-10.

St. Vrain Valley Fair, Longmont, Sept. 7-10.

Lincoln County Fair, Hugo, Sept. 15-18.

Conejos County Fair, Manassa, Sept. 16-18.

Routt County Fair, Hayden, Sept. 15-17.

Farmers and Stockgrowers' Fair, Burlington, Sept. 22-25.

Montezuma County Fair, Cortez, Sept. 21-24.

Las Animas County Fair, Trinidad, Sept. 21-24.

Soil Products Exposition, Denver, Sept. 27-Oct. 9.

El Paso County Fair, Calhan, Sept. 29-Oct. 2.

Colorado Agricultural Fair, Overland Park, Denver, Oct. 2-9.

Dry Farming Congress, Denver, Oct. 30-Nov. 10.

IDAHO

State Fair, Caldwell, Sept. 27-Oct. 1.

Northwest Livestock Show, Lewiston, Nov. 29-Dec. 4.

MONTANA

State Fair, Helena, Sept. 20-25.

OREGON

State Fair, Salem, Sept. 27-Oct. 2.

Multnomah County Fair, Gresham, Sept. 14-19.

Clackamas County Fair, Canby, Sept. 20-23.

Pacific International Live Stock Show, Portland, Dec. 6-11.

UTAH

State Fair, Salt Lake City, Sept. 26-Oct. 3.

National Wool Growers' Association, Salt Lake City, Sept. 6-7.

WASHINGTON

State Fair, North Yakima, Sept. 20-25.

Columbia River Interstate Fair, Vancouver, Sept. 6-11.

Interstate Fair, Spokane, Sept. 13-18.

Walla Walla Fair, Walla Walla, Sept. 13-18.

Columbia River Carnival, Kennewick, Sept. 12-14.

Corn and Hog Show, Prosser, Oct. 22-24.

Stevens County Live Stock Show, Oct. 27-30.

Western National Dairy Show, Seattle, Nov. 8-13.

Cascade International Stock Show, North Yakima, Nov. 22-27.

WYOMING

State Fair, Douglas, Sept. 26-Oct. 2.

RIO VISTA HORSE SHOW

Rio Vista and the local center of the Solano County farm bureau with County Farm Adviser J. W. Mills, are planning for a gala day at Rio Vista on September 9.

A detailed program has not yet reached us but there will be a parade in the morning and horse and colt show. Prizes are to be awarded for the best horse and colt in each class, the nature of the prizes to be announced later. In the afternoon there will be a water carnival, boat races, swimming races, tub and barrel races and other events of a similar nature. There will also be a band concert. In the evening a grand ball, under the auspices of the Woman's Improvement Club, will crown the day's festivities. During the progress of the ball there will probably take place a water pageant.

Members of the central committee are: Dr. A. J. McKinnon, John McCormick, E. W. Westgate, A. Harvie, Geo. Sanford, A. R. Grinstead.

VINTAGE FESTIVAL AND NAPA COUNTY FARM BUREAU FAIR

St. Helena will hold her fourth vintage festival, September 3-6.

The Napa County farm bureau has decided to join in the celebration this year, making it a four-day event. It is reported that six carloads of poultry

and stock will be exhibited. The locals of the farm bureau will also make exhibits. Professors Crocheron, True, Bioletti, Clark, Shaw and Mead of the state university will be present to speak to the members of the farm bureau.

A big stock parade will be the feature of Saturday. It will be staged at 10 o'clock in the morning. There will also be a floral and industrial parade, allegorical dances, and many amusement features.

RIVERSIDE DISTRICT FAIR

The third annual fair of the Riverside District Fair Association will be held October 5-9. Premium lists are now being mailed and premiums are liberal enough to induce a good showing of all kinds of farm products, including live stock. The superintendent of the live stock exhibits is F. W. Stalder, one of the largest live stock breeders of the southern end of the state. Automobile exhibits will be especially strong. Of course special attention will be given to music and feature entertainments, but primarily it is an agricultural fair.

The officers of the association are: J. F. Backstrand, president; O. P. Sanders, secretary, and J. E. McGregor, manager.

The first arrest made under the new fruit standardization law was of a table grape packer at Dinuba.

DYNAMITE WARNING

With the farmers of this country using about 25,000,000 pounds of dynamite annually there is opportunity for serious accidents, especially in consideration of the fact that some unwise instruction has been passed on to them. We have a letter from an expert in the handling of explosives in farm operations and he refers to some of this so-called information and to the danger of following it.

For instance in a recent article in a farm paper the writer said: "To attach the fuse, place one end in the cap and force it down to the primer." The word "force" has no business anywhere near the word "cap," except in a warning not to use it. Caps are filled with fulminate of mercury which is far more sensitive than dynamite, and it is not only dangerous to force fuse into the cap, but entirely unnecessary because the fuse is always smaller in diameter than the inside of the cap.

The same writer says: "After the cap is set crimp it near the top." Which is the top? If the farmer who follows these directions guesses wrongly, he will lose his hand.

He also writes: "Do not go back to inspect the work thinking the fuse has gone out until at least 20 minutes have expired." We recommend a half day instead of 20 minutes. When a fuse fails to fire a charge in a minute or two, the chances are the powder train is broken. This means that the cotton of the fuse is on fire and the spark is slowly traveling to the point where the powder train is again taken up. It may do this in one minute or one hour. Many of the accidents in using dynamite have resulted from inspection of presumed misfires.

ORCHARDISTS find sand cultivation difficult. Until a recent date no suitable tractor had been placed on the market that met this peculiar condition. **THE YUBA BALL TREAD TRACTOR** has met and successfully overcome this difficulty. Its distinctive features have made this possible.

The Ball Tread does not sink in the sand. The balls are large enough to crush any particles of sand that enter the ball race. The compactness of the machine permits it to run under the fruit-burdened branches without injuring them.

The unique transmission allows the machine to get close to the trees and

eliminates one man from the plow; because the full power of the motor can be thrown on one tread it is unnecessary to lift the plow in going from one row to another.

Yet the Yuba Ball Tread Tractor has power enough to work equally as well in heavy adobe soil as in the shifting sand.

Entered at the Post Office at Los An-
geles, California, as Second-Class Matter.**Thursday, Sept. 2, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling dif-
ferences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**HOT WEATHER**The state has been given a
taste of good old summer time and
some little damage has been done.
However, the walnut districts which
feared the most from the heat report
that on the average there will be less
than one per cent of injury to the crop.
The hot September day of 1913 caused
damage in various sections of from 15
to 40 per cent, so that it may be seen
that this year's injury will be exceed-
ingly light.**SOIL PRODUCTS**The International Soil Products
Exposition will be held in Denver,
September 26 to October 10, in con-
nection with the International Dry
Farming Congress. Secretary R. H.
Faxon of Denver writes that governors
of nearly all the western states have
written of their intention of being
present. The Dry Farming Congress
has been a material factor in the up-
building of the semiarid West. It has
had to do largely with the legislative
side of the dry farming interests, but
the exposition has so much to do with
the productive end that all classes
interested in the upbuilding of the
West should be and doubtless will be
so far as possible present at this ex-
position.**GIVE US DATES**It is one of the missions of the
Cultivator to pass on information as
to agricultural fairs and other events
of interest to our people. Very often
we receive communications giving in-
formation as to character of the fair
or event or even touching at some
length on vaudeville stunts of various
kinds which are to be features of the
fair, but neglecting to give the allimportant detail of the date. Hence
the item is of but little value from a
news standpoint. When a special fes-
tival day or fair is to advertised we
think one of the principal efforts
should be to burn that particular day
into the minds of all the people of the
state as being devoted especially to
that one event, but we believe half
of our informers neglect this impor-
tant feature.**COOPERATING COOPERATORS**Sheridan W. Baker, a director of
the Santa Rose Cured Fruit Associa-
tion, is another cooperator who plans
for a larger and more general co-
operative movement, one which will
enable the various cooperating organ-
izations to affiliate with other similar
organizations in the distribution of our
products. Too often the products of
one farm come into competition direct-
ly with the products of a neighboring
farm and both bring low prices. This
is true especially when goods are sent
to the market and turned over to the
commission man who uses the crops
of one neighbor to batter down the
prices paid to another.Mr. Baker writes that he would like
to see representatives of California's
various cooperating organizations
meet in Visalia at the time of the
State Fruit Growers' Convention and
discuss this matter.We have a still better suggestion
for Mr. Baker and others who believe
in this same general cooperative
movement. Why not encourage organ-
ization of a general state federation
of all agricultural organizations? Such
a movement was launched nearly 12
months ago and a committee met at
the recent State Fruit Growers' Con-
vention at Palo Alto and decided to
call at an early date, possibly in Octo-
ber, a general meeting of representa-
tives of all agricultural organizations
in California. There is certainly an
increasing demand for this inclusive
organization.**NATIONAL DEFENSE**In his "Our National Defense,
The Patriotism of Peace," Mr. George
H. Maxwell says that we have in this
country militarists, passivists, pacifi-
cists, pacificators and finally, women's
peace party. Between the two ex-
tremes of militarists and passivists
who wish peace at any price, the oth-
ers are placed. Mr. Maxwell places
himself in another class, and he surely
has presented in his remarkable book
peace plans which are worth consider-
ing by the American people. We wish
this book could be read by every
American. It has somewhat of a pes-
simistic tone and through it runs a
word of warning to the nation to pre-
pare "against" war. After discussing
the methods preferred by these classes
from militarists to passivists, he as-
serts that the Frankenstein of war can
be controlled by "organizing a system
of national defense against Nature's
destroying forces, which can, by touch-
ing a button, be instantly transformed,
if need be, into a force for national
defense against a foreign invasion or
to uphold the rights or honor of the
nation.""Has it occurred to you that, unless
we wake up, mend our ways and
change our national policy, war is ulti-
mately as inevitable between the
United States and Japan as it has been
for years between France and Ger-
many."However, the author appeals for "no
militarism" or control by a militaryparty, for while "Japan with infinitely
less resources has a military system
more than 40 times more powerful
than this republic," there are other
methods of defense which mean build-
ing up in time of peace. Methods
which have made Germany strong
and which obtain in Switzerland and
Australia are referred to, then a modi-
fication is suggested by the author.In a word his plan calls for the using
of this land by the people of America
who are today hungry instead of the
large land holders leasing it to Asiatics
or even Europeans who are not intend-
ing to become an integral part of our
nation.To fit these lands for occupancy let
there be enlistment of an army of
peace, working under civil control in
time of peace to safeguard against the
invasion of nature's devastating forces.The German system of forests and
waterways would, under this plan, be
adopted in the United States and ex-
tend to the building of all public
works necessary to regulate and stand-
ardize the flow of rivers, prevent and
protect against floods, conquer the
deserts and reclaim the swamps, in-
cluding a great national system of
highways. The men doing this work
would be enlisted as reservists, as are
the foresters of Germany, France and
Russia. They would be given substan-
tially the same military training that is
given to the foresters of Germany or
to the reservists of Switzerland and
Australia. Switzerland has a re-
serve of 500,000, Australia of 600,000.
Instead of spending millions, even
hundreds of millions, on a vast stand-
ing army maintained in partial idleness
a vast constructive force would
increase our national wealth and, of
far more importance, give opportunity
to the homemaker to secure a living.If America does not see fit to save
these lands for her own people "the
Japanese nation which has a total of
arable lands less than that of Califor-
nia's one central valley, and is in-
creasing with such rapidity that
swarming is becoming a necessity, will
some day take them for her own use."We feel, however, that Mr. Maxwell
is somewhat over enthusiastic as to
the productiveness of American acres.
He thinks that the Sacramento Valley
and some of the rich lands of the for-
mer Colorado desert are capable of
supporting a family on each acre and
in addition enabling them to put aside
a comfortable nest egg each year. At
least he says that the Japanese, the
Belgians or the French could make a
living on these lands and Americans
should be educated to it. They never
will be. The intensive methods and
the knowledge required can never be
brought to the point of forcing an
American living from only one acre or
soil. Possibly for one year, and may
be longer, under favorable circum-
stances, in isolated cases, it might be.
But as to averages and good and bad
years, it can be only in a dream. But
if it were possible then the author
contends that on that basis the one
great central valley of California could
support 12,500,000 families and with
the idea that the head of every one of
these families should be a defender of
the nation.Some of the author's ideas will be
startling to many but we would sug-
gest to our readers that they get Mr.
Maxwell's book and read it. It will
cause some serious thinking, especially
in view of the fact that Great Britain
is showing to the world today some of
the weak spots in her system of car-
ing for her common people. Besides
with national integrity lightly consid-
ered and treaties becoming scraps of
paper it is the worst of folly for the
richest of all nations to be unpro-
tected.**Agricultural Notes**A congress of all farmers in the
Philippine Islands met at Manila the
latter part of August.Chicago cold storage houses are so
filled with eggs that apple growers are
puzzled to find a place to store their
fruit.The honey crop of Texas is unusu-
ally short this year, some sections re-
porting only one-fifth to one-seventh
of a normal flow.Estimates of Florida's citrus crop
for this fall indicate that grapefruit
will be 25 per cent short and oranges
10 to 15 per cent short.Of the 3520 cheese factories in the
United States federal officials credit
Wisconsin with 1720 or nearly one-
half of the entire number. New York
ranks second with a few less than a
thousand.The rice acreages of all the south-
ern rice growing states have increased
this year. For all rice producing
states in the Union the total estimated
acreage for 1915 is 801,139, compared
with 689,908 last year.Wisconsin has more silos than any
other state in the Union. It is esti-
mated that in January, 1914, there
were 41,500 silos in the Badger state,
or more than two and a half times as
many as Illinois, its closest rival.Exports from the United States to
South America in March, April, May
and June show an increase of 34 per
cent over those of the corresponding
months of last year, amounting to
\$45,000,000, against about \$35,000,000
in the same period of last year.New Zealand will have a large ex-
hibit of prize sheep at the Panama-
Pacific Exposition. The following
breeds will be on exhibition: Romney
Marsh, Corriedale, Lincoln, Border Lei-
cester, English Leicester and Down.
Last year New Zealand raised 25,000,
000 sheep and exported about 7,000,000
dressed.The mileage of concrete pavements
in the United States has increased
rapidly, and it is likely to continue
to increase, according to a new bulle-
tin of the United States department
of agriculture. This bulletin gives the
estimated amount of concrete pave-
ment in the United States in 1914 as
19,200,000 square yards; in 1909 it
was only 364,000 square yards.Contrary to the prevailing belief
that this year's output of beet sugar in
Belgium would be negligible, a corre-
spondent of the London Times reports
that nearly all of the Belgian factories
are at work, including those at Wanze
and Huy, between Liege and Namur,
and at Tirlemont. The manufactur-
ers, says this correspondent, have no
expectation of making any profits, but
they are doing a great work in that
they are saving \$6,000,000 worth of
beets and are providing employment
and a livelihood for their hands.The area of the Chugach National
Forest, Alaska, which is to be crossed
by the railroad that the government is
building from Seward to Fairbanks, is
reduced nearly one-half by a proclama-
tion, signed by President Wilson, re-
turning approximately 5,802,000 acres
to the public domain. This action fol-
lows classification of the land by the
forest service showing that the areas
involved are not of high enough tim-
ber value to warrant government pro-
tection, and means the largest elimina-
tion of national forest land ever made
by a single presidential proclamation.
Not much of the land eliminated is
valuable agriculturally.

Agricultural News Notes

of the Pacific Coast

Northern California

A number of sales of hops have been made at Ukiah, Mendocino County, at 12½ cents.

The purchase was made last week of practically all the long wool in the Cloverdale district at a price of 27½ cents.

A special stock train made a record run from Chico to San Francisco on August 12. The trip was made in 12 hours.

The suggestion is being made that the Sacramento Valley exhibit at the San Diego exposition be permanently located at Los Angeles.

Hop growers of Wheatland, Yuba County, estimate their crops will be heavy this season. The prospect for better prices is also good.

State Veterinarian Keane is protesting against sale of horses to be used in the European wars. He says that we need the stock at home.

Many peach growers in the district about Marysville have been feeding their peaches to the hogs because of lack of satisfactory market.

Five hundred and twenty-three acres of land, formerly the Crain ranch near Oroville, Butte County, has been sold to a company which will plant it to rice.

A movement is reported to have been started among fruit growers to make the provisions of the new standardization law apply also to fruit shipped to market within the state.

Arbuckle, Colusa County, will observe September 6 as Almond Day. There will be exhibits of almonds, for which cash prizes are offered. There will also be an almond hulling contest.

Wool growers of northern Sonoma and southern Mendocino Counties met in Cloverdale Tuesday, August 24 with State Veterinarian Keane to determine methods of eradicating sheep scabies.

B. B. Meek of Oroville, after a trip through olive growing sections of the state, makes the statement that any over-stock of olives now on hand is of the small green fruit, that large sizes of good fruit are all sold out.

The boys of the Woodland high school agricultural club are bringing to a close the year's pig club contest. Subscriptions are being received to send the winner with 40 other club winners of the state on a continental trip to study agriculture.

A test will be made of the constitutionality of the recently enacted law prohibiting sale of imported eggs unless plainly labeled. Dealers claim that much stock on hand is spoiling in the warehouses because bakers are loath to buy goods labeled "Chinese."

Oroville orange growers are protesting against the so-called eight-to-one test for determining the maturity of oranges. They claim that the fruit in their district carries a larger percentage of juice than fruit grown elsewhere, and that therefore the poorer oranges containing less juice often pass the test satisfactorily where the good oranges are thrown out.

Central California

The cooperative poultry association of Tulare County shows business transacted for July totaling \$4,372.

Work has begun in the fumigation campaign against the red scale in the Porterville district of Tulare County.

Two hundred tons of Reedley raisins have been ordered for shipment to England through the Associated.

The interstate commerce commission has been requested to allow shipment of green grapes east in uncovered lug boxes.

The almond orchards of Merced are suffering from the pest of red spider. Orchardists are fighting it with liquid sulphur sprays.

The beet slicing campaign began at the Spreckels factory Monday, August 30. The campaign will probably last until the first of December.

The Madera County farm bureau has organized a Swine Breeders' Association whose main object is the prevention of hog cholera.

Sweet potatoes are being shipped from Atwater, Merced County, and are bringing a price to the growers of \$2.50 per hundredweight.

The Associated Raisin Company has issued an appeal to all growers not to pick grapes for raisins until they carry sufficient sugar to make best grade raisins.

Seventy-five cents has been fixed as the minimum price for standard and fancy Bellflowers by the executive board of the Watsonville Apple Distributors.

Peach cutters in the Dinuba packing houses are receiving three and one-half to five cents per box this year. Field laborers receive two dollars a day.

One thousand seven hundred and seventy-five head of cattle from the Poso Ranch in Kern County were purchased last week for \$135,000 for shipment to Europe.

The Tulare County Citrus Association will this season market through the exchange. The association plans to erect packing houses at Cutler, Orosi and Orange Cove.

Harvesting of the almond crop is well started in the Oakdale section of Stanislaus County. The crop is about two weeks ahead of last season and more than double in quantity.

Report of the engineer appointed to look over the proposed Lindsay-Strathmore irrigation district will be heard by the supervisors on September 10. The new district would bring over 100,000 acres of land under irrigation.

A mass meeting of peach growers was held at Fresno the last Saturday in August to form a California peach growers' association, modeled on the same plan as the California Associated Raisin Company. It is to be capitalized at \$100,000.

According to O. P. Brownlow, game warden of the Porterville district, property owners whose crops are being damaged by cottontails may kill them now despite the fact the season is closed. The season will open again to everyone on October 15.

Southern California

Lima bean growers of Orange County are refusing offers of four and one-half cents.

The Whittier Citrus Association is trying out the new cyanofumer in its fumigation operations.

Many hundred acres of beans are now being harvested in the Beaumont section of Riverside County.

There are 3000 acres of walnut trees in full bearing in the El Monte district of Los Angeles County.

Citrus growers of Rialto recently held a meeting with County Horticultural Commissioner Coy and decided to fumigate all groves.

For the year ending August 31 citrus growers of Orange County received returns aggregating \$3,760,000. About one-fifth of this is for lemons.

Supervisors of Imperial County have been notified that unless they appoint a county sealer of weights and measures the appointment will be made by the state.

Great preparations are being made for the Riverside district fair to be held at Riverside October 5-9. The new Women's Exhibit Palace has just been completed.

Fifteen horses valued at more than \$100,000 were recently shipped in a special car to the San Francisco exposition from the Santa Anita Rancho in Los Angeles County.

One feature of the Ventura County fair exhibits was a special exhibit from Ahacapa Island which is included within the county. The exhibit was of fish, seals and sea mosses.

It is reported that the extension department of the state university will soon establish a model farm at San Luis Obispo, to be conducted by the state polytechnic school.

A large number of Covina ranchers attended the sessions of the fumigating school at Pomona, recently held under direction of C. W. Woodworth of the state university.

Preparations are being made in the Paso Robles section of San Luis Obispo County for the almond harvest. Hundreds of acres of young trees came into bearing this year for the first time.

The El Monte Walnut Growers' Association has awarded contracts for the erection of a walnut packing house. This association affiliates with the California Walnut Growers' Association.

The Bean Growers' Association of Garden Grove has been organized with M. A. Mathews, president, and Edward Chaffee, secretary. Plans are being drawn for the erection of a new warehouse adjoining the walnut packing house.

Lima bean growers of Orange County propose to form a county exchange to secure reliable information regarding crop and marketing conditions. Associations have already been formed at Garden Grove, Smelter and Wintersburg and on the San Joaquin Ranch. These Associations will join in a central exchange.

The Coast

Idaho is sending a big exhibit to the Spokane Interstate Fair, which opens September 13.

Tekoa, Washington, reports many harvest fires, several of them caused by smut explosions.

It is said that 200,000 homesteaders have filed on land in New Mexico during the past ten years.

A poultry show will be a big feature of Spokane's Interstate Fair to be held September 13-18.

There will be an Indian agricultural fair September 8, 9 and 10 on the Spokane Indian reservation near Lincoln, Washington.

Sixty thousand sheep and 10,000 horses and cattle were grazed last year in the Umatilla National Forest of Oregon.

The executive committee of the Northwestern Grain Dealers Association held its annual meeting at Helena, Montana, August 21.

Beavers are destroying orchard trees at Freewater, Oregon, and the state game warden has been asked for a special permit to destroy the beavers.

The fifth annual Columbia River Valley Grape Carnival will be held at Kennewick, Washington, September 13-15. About \$1,000 cash will be given in prizes.

Special prizes have been offered for Shire horses exhibited at the Oregon state fair September 27-October 2. Prizes are offered by the Shire Horse Society of Great Britain and Ireland.

Local bankers of Washington are cooperating with the extension service of the state college in having moving pictures taken of farm operations to be used as an educative feature.

Yellow jackets are so numerous in the mountains near Pomeroy, Washington, that cattle refuse to go to watering places often enough to keep in good condition. All the springs and moist grounds are alive with the pests.

At a meeting held in Marcus, Washington, last Saturday, steps were taken to organize the Upper Columbia Live Stock Association and to arrange for a stock sale to take place at Marcus some time in October.

"A pig for every boy and girl in Spokane County" is the slogan of the Spokane County Pomona grange, which last week instituted a pig raising campaign in which it will endeavor to enroll as many boys and girls as possible.

A preliminary organization has been effected of live stock men of the upper Columbia. Permanent organization will take place at a meeting to be held in Marcus, Washington, October 4 and 5, at which time there will also be held a big stock sale.

An outbreak of hog cholera is reported at Idaho Falls, Idaho. State Veterinarian Bodie reports that more hog cholera serum is being used by swine raisers of the state than ever before and that the disease is less prevalent than in former years.

There is a Difference between the Ideal Green Feed Silo and Other Silos

IT DOESN'T TAKE AN EXPERT to tell the difference between an Ideal Green Feed Silo and some others.

ON THE CONTRARY, it is an easy matter if the prospective purchaser will remember that a silo to be of any value whatever must be "air and water-tight" and capable of producing good ensilage from every pound of good feed put into it.

IF HE WILL THEN TAKE FIVE MINUTES to compare:

The detail of construction,
The quality of material and workmanship,
The contact of the doors with the door frame,
The kind and size of hoops and lugs used,
The quality of the paint for the inside.
The type of roof and whether or not it is fitted with a galvanized ventilator.

What provision, if any, is made for keeping the silo round and preventing its collapsing,

In fact, everything that enters into the design and construction of a silo that will make it a thoroughly practical piece of equipment,
He will then see the difference.

THE MAN WHO TAKES even the first step indicated in seeing for himself the difference between the Ideal Green Feed Silo and others does not put his money into any other, one time in a thousand.

THE COMPARATIVELY FEW BUYERS of other silos are those who merely read printed claims, or listen to the argument of some self-styled "adviser" who is probably working for a commission only and whose sole purpose is primarily to sell a bill of lumber.

THE WISE BUYER OF A SILO today does see the difference when buying his first silo while the unwise or careless one usually finds that his presumed saving in first cost actually means a loss to him in spoiled feed and represents the difference between success and failure in the use of a silo.

OUR PURPOSE in selling a silo is to develop the dairy and stock raising industry on a more substantial basis than heretofore, and in order to do this we must supply a silo that is a thoroughly practical piece of equipment.

THAT IS THE REASON WHY four buyers out of five are buying Ideal Green Feed Silos and why the use of the Ideal Green Feed Silo will, before long, be as nearly universal on the Pacific Coast ranch as it is in the Eastern States and Canada.

SORE SHOULDER INSURANCE

If you could get insurance against your horses becoming sore-shouldered when most needed, you would take it at any reasonable price.

Why not take it FREE by using
W. DAVIS & SONS'

Horse Collars

"Felt-Face"each \$5.00
"Cushion" Collars.....each 3.00

This "Cushion" Collar is a combination of leather and canvas, guaranteed to cure sore shoulders and "stand the racket."

The "Felt-face" collar is all-leather, first-quality of oak-tannage, hand-thonged throughout. It has a facing of felt under the leather face, producing a soft yet firm surface against which the animal pulls.

It is natural for any manufacturer to say that his collars are "the best," but it is only about "FELT-FACE" collars that letters like this are written:

W. DAVIS & SONS, San Francisco.

Gentlemen:—I sold the Red Bands Orchard Co. two Felt-face collars about a month ago for two sore-neck mules which are all healed up now. They came in today and ordered one dozen. Please send me soon as possible 1½ dozen, from 17 to 22-inch.

Very truly,

W. F. INGWERSON

Live Stock and Dairy

SACRAMENTO VALLEY DAIRY PROGRESS

Written for California Cultivator

By W. S. Guilford

GOOD many milking machines are being sold to Sacramento Valley dairymen and they are giving splendid satisfaction, and thousands of cream separators have been distributed over this section.

There is a steady increase in the number of cows being milked. Mature animals are being brought in from other districts and the natural increase is furnishing many. The man that has a heifer calf that he does not want to raise does not often have to look farther than his neighbor for a buyer, and few if any females are killed for veal.

There is no big cow selling movement that could be called a boom, but high prices for cows are maintained and there is strong competition for the cream. Almost every district has one or more butter or cheese factories and others within a radius of 150 miles or more are eager buyers.

The growth of the dairy business in some parts of the valley is causing increased planting of alfalfa; in others the increase in the alfalfa acreage was the reason for the start and growth of the dairy industry. And everywhere that cows are milked there is sure to come an increase in the number of silos.

With the abundance of alfalfa, corn and barley that can be grown in the Sacramento Valley, the production of dairy products per square mile of good soil must some day be such as to place this in the front rank among the dairy districts of the world.

Sacramento Valley dairymen are as a class very progressive and many of them are gradually working into the growing of pure bred animals. The demand for registered bulls has been good and cows of demonstrated producing ability sell at a good premium. A heavily milking cow will bring \$150 from many dairymen much more quickly than an indifferent animal will bring \$75. This is as it should be—but not as it is with many buyers.

Weeding out of undesirable animals, "boarders" that barely or not quite pay for their feed, is going on constantly in the best herds. Some of these animals go to the butcher; others to amateur dairymen who must learn, or to cow traders to be passed on to careless buyers.

The upbuilding of an industry is a matter of slow, steady growth. Such things have never been done in a month or a year, nor can such be expected here. There were many years of discouragement during the early days of the dairy business in the districts in the Middle West that are now in the lead. Thirty or twenty or even ten years ago the dairy industry in Iowa was of little consequence in comparison to what it is now. The best districts here are developing faster than they did there.

More About Silos

I had a long and very interesting visit recently with a prominent Sacra-

mento Valley stockman and breeder of pure bred cattle, and the talk soon turned to silos.

"Silage is the greatest feed we have," said this "hard headed," practical man, "and there must be many more silos all over the state if we make the best of the dairy industry and increase production as it can be."

This is the verdict of all thoughtful men who are students of the situation.

In the herd of this breeder are some animals of very fine breeding that have never been officially tested, and I asked him why he did not make tests with some of them. "They are bred right, but they were not grown and developed right," he said. "A dairy animal must have great feeding capacity and this is a matter of development that must start when the animal is young. A small amount of dry feed will not make the 'middle' that is necessary to care for the amount of feed that must be assimilated in order to make big records. And that is where the silage comes in. The calves from some of these cows that are being raised on silage and plenty of other feeds will be candidates for records, and big ones."

This breeder has one silo now and expects to build another this fall, and unless his present plans change it will be a stave silo of one of the popular California makes.

I saw another herd of registered cattle not long ago in which cows were not producing the milk they should because they were being fed an exclusive alfalfa ration. Corn silage and some grain would be worth more than its ordinary value to feed to this herd, for it seems that continuous feeding with alfalfa alone so taxes the system of an animal with too much protein that it gets more and more in need of carbohydrates.

The difference in the appearance of the old ewes that have been fed on silage for three weeks at Butte City Ranch, in Glenn County, is very marked and they are eating it greedily. The registered Berkshires are as keen for it as they were at first, and it will make up a part of the daily ration for them as long as it lasts.

I have been interested to note some reports on corn silage feeding by some of the biggest feeders of sheep in the Middle West. One of them says. "A ton of silage produces as many pounds of grain as a ton of hay. It obviates the use of hay entirely. The stock is maintained in healthy condition; in fact I never had a sick sheep or lamb while feeding silage. When starting them on it care is necessary, but once accustomed to the feed they thrive."

The mules at Butte City Ranch are eating some silage with apparent relish and good results. At the North Carolina experiment station it was found that mules could be satisfactorily fed on 20 to 30 pounds of corn silage per day when bran and oil meal were fed to make a protein balance for the carbohydrates in the corn.

Drinking water for cows should be fresh and uncontaminated from any source. The well should be so located and protected that there is no danger of pollution of the water by the drainage from the barnyard, manure piles, or other sources.

SHEEP AND WOOL INVESTIGATORS

By Robert F. Miller

On August 9 to 11 a conference of sheep and wool investigators of Western agricultural colleges was held on the exposition grounds at San Francisco. The following colleges were represented: J. A. Hill, Wyoming; R. R. Dodderidge, Montana; J. T. Cain, Utah; F. D. Wilson, Nevada; R. F. Miller, California, and J. M. Jones, Texas.

The improved system of preparing wool for market was discussed, sheep problems of the different states were considered, and the wool exhibits of foreign nations and the various states were inspected.

Mr. W. T. Ritch of Salt Lake City was present and gave a review of what had been done under the improved system, or the skirting and classing of fleeces, at the Bitter Creek Shed, Wyoming. Professor Hill also told of the success at the Swastika ranch at Laramie, Wyoming.

The general system was highly endorsed by the men present. It is operated on a sound business basis, the wool is put up clean, is classed and is packed in uniform bales, the grower becomes familiar with the grade of wool he is producing, thereby encouraging breeding for same, and last, but not least, the sheep are easily and quietly handled.

The financial advantage is certain to follow as soon as the market becomes adjusted to the new method of marketing. For illustration, we only need to turn to Australia, the greatest wool producing country in the world, practically the same size as the United States and running nearly twice as many sheep.

An association was formed, named "The Range Wool Improvement Association." The advisory committee is to be composed of one member of the animal husbandry division of each of the Western agricultural colleges represented; also one member to act as state instructor who is devoting time to sheep and wool. In this way it is planned to conduct an educational campaign, Mr. Ritch being the official lecturer, to bring this improved system thoroughly before the sheep men of each state. If it meets with approval it is hoped to construct two modern shearing sheds in each state to afford sufficient work for a trained crew for at least four months.

The wool exhibits at the exposition proved very instructive. In the Australian building among other exhibits wool stands out prominent. A striking display of the Australian Merino may be seen here. In the Palace of Agriculture New Zealand has spared no pains in arranging a very attractive display characterized by the selection of crossbred fleeces. Lincoln and Romney fleeces are also well represented and a collection of scoured bellies, pieces and pulled wool is displayed.

The Argentine Republic's exhibit, though not so extensive, shows a collection of wools native of that country, mainly Lincoln-Rambouillet cross. Full information is given with each fleece regarding the breed, shrinkage, etc.

The states of Ohio and Nevada also have attractive exhibits.

Hold on to the best of your dairy heifer calves, and sell some enterprising neighbor your surplus males that are of superior quality.

THE MAKING AND FEEDING OF SILAGE

Silage during the last three decades has come into general use throughout the United States, especially in those regions where the dairy industry has reached its greatest development. Silage is universally recognized as a good and cheap feed for farm stock and particularly so for cattle and sheep, are the observations made in Farmers' Bulletin 578.

Silage is the best and cheapest form in which a succulent feed can be provided for winter use, continues the bulletin. An acre of grain can be placed in the silo at a cost not exceeding that of shocking, husking, grinding and shredding. Crops can be put in the silo during weather that can not be used in making hay or curing fodder, which is an important consideration in some localities.

A given amount of corn in the form of silage will produce more milk than the same amount when shocked and dried. There is less waste in feeding silage than in feeding fodder. Good silage properly fed is all consumed, and in addition very palatable. Like other succulent feeds it has a beneficial effect upon the digestive organs, and more stock can be kept on a given area of land when it is the basis of the ration.

On account of the smaller cost for labor, silage can be used for supplementing pastures more economically than can soiling crops, unless only a small amount of supplementary feed is required. Converting the corn crop into silage clears the land sooner than if the corn crop is shocked and husked, and because of these advantages silage, in the general opinion of dairy farmers, has increased milk production per cow and has increased the profits per acre.

Corn

In all parts of the United States where the silo has come into general use the principal silage crop is corn. One reason for this is that ordinarily corn will produce more food material to the acre than any other crop which can be grown. It is more easily harvested and put into the silo than any of the hay crops, such as clover, cowpeas or alfalfa.

Furthermore corn makes an excellent quality of silage. The legumes, such as clover and alfalfa, are liable to rot unless special care is taken to pack the silage thoroughly and force the air out. The only objection which has been raised concerning corn silage is the fact that it contains insufficient protein fully to meet the requirements of animals to which it may be fed. The best variety of corn to plant is that which will mature and yield the largest amount of grain to the acre, since the grain is the most valuable part of the corn plant. The variety commonly raised in any particular locality for grain will also be the most satisfactory to grow for silage.

Sorghums

Sorghums, both saccharine and non-saccharine, are readily made into silage. On account of their superiority to corn as drouth resisting crops they are more commonly grown in those regions of the West where the rainfall is too light or irregular for a good growth of corn. It is important that the sorghums be harvested at the proper stage of maturity if the best results are to be secured. A mixture of corn and sorghum has proved satisfactory in some localities where the rainfall was so variable as to make the corn crop uncertain.

THE TWO GREAT SALES

The Greatest Sale in the World Combination Sale

A. W. Morris & Sons
WOODLAND, CALIFORNIA

McAlister & Son
CHINO, CALIFORNIA

Sacramento, Cal., October 6-7, 1915

175 Registered Holsteins 175
Tuberculin Tested

70 Advanced Registry cows—more than in any other sale in the world—with records as high as 31.47 lbs. butter and 713 lbs. milk in 7 days and 828 lbs. butter in 1 year.

70 daughters of Advanced Registry cows with records as high as 33 lbs. butter in 7 days and 1000 lbs. butter in a year. Included in this list are daughters of many of the greatest sires of the breed.

Sons of 30-lb. cows and sons of 1000 lb. butter cows (one a world's champion). A great selection from which to choose your next herd sire.

And King Segis Pontiac Emperor, senior herd sire of A. W. Morris & Sons, in whose blood flows the blood of more world's champions and great record cows than any other bull, living or dead, and Lorena Korn-dyke, the world's greatest show bull.

Altogether the greatest array of Holstein cattle in respect to individuality, breeding and great records ever led into any sales ring.

HOLSTEINS AT THE SACRAMENTO SALE

Referring to some of the fine blood lines which will be represented in the coming Holstein Sale at Sacramento, Mr. McAlister writes:

King of the Pontiacs is the sire of 164 Advanced Registry daughters

approximate cost of keeping her was \$50 a year, or a total of \$750.

The average daily production of milk for the 15 years was a little more than nine quarts a day. During her best year she produced a little more than 18 quarts a day.

If the butter was sold instead of the milk, at the price of 35 cents a pound, the total for the butter pro-

King of the Pontiacs

including the world's champion 44-pound cow and also King Pontiac Topsy, senior herd sire of McAlister and Son. Twenty daughters of King Pontiac Topsy, many in calf to

duction from Grace Briggs would be \$2,041.55.

The Orange County Fair will be held in Santa Ana October 12-16.

Tilly Alcartra

Tilly Alcartra Son, will be sold at the Morris-McAlister combination sale to be held in Sacramento, October, 6-7.

Tilly Alcartra is the dam of Tilly Alcartra Son, junior herd sire of McAlister and Son, and nearly 40 cows and heifers in the Sacramento Sale will be in calf to him. Tilly Alcartra has the following record: Butter, seven days, 32.23; milk, seven days, 783.7; butter, one year, 1189 pounds; milk, one year, 30,452 pounds (world's record).

NINE QUARTS DAILY FOR 15 YEARS

Fifteen years ago an assistant in the dairy department of the University of Missouri began to keep a record of the milk and butter production of a small Jersey cow. This assistant has gone and others have come and gone, but the Jersey cow is still on the job. In the 15 years she has produced 108,968 pounds of milk and 5000 pounds of butter fat, or 5,833 pounds of butter.

Her best year's record was 13,322 pounds of milk and 730 pounds of butter.

During the 15 years this cow, Grace Briggs, has given birth to 12 calves. Her last calf sold for \$300, and the average for the twelve is about \$200. About \$2,400 was obtained from the sale of all the calves. Figuring the entire milk production for 15 years at eight cents a quart, the total would be \$4,358.72. The

The four important memory gems to be committed in rearing bright and ambitious calves are:

Keep the pails clean.

Feed regularly milk of the same condition and temperature.

Turn on green pasture only after wet feeding is discontinued.

Supplement the milk with a suitable grain and roughage ration. Increase this gradually as growth advances.

TEN GUERNSEY COWS AVERAGE 947 lbs. FAT

Large and Economical production is the key to larger profits. The Guernsey Cow is a sure way to increased profit.

Shall we send literature?

Guernsey Cattle Club,

Poultry for Profit

THE PROS AND CONS OF FALL HATCHING

Written for the California Cultivator
By Jean A. Koethen

GENERALIZING is rather risky business except in matters of absolute right and wrong. Particularly is this true in matters of poultry culture for so many considerations enter into almost every transaction. Were I asked "Would you hatch in the fall?" I should reply, "Yes, if—, and if—, and if—; otherwise not." Ifs and buts are such tiresome things, and yet one has to sit down calmly and count the cost of this and that and look at the matter from all directions.

Hatching Costs More

First as to the cost of fall hatching. There seems to be no doubt that a fall chick costs more in actual coin of the realm than a spring chick. That is, a hen-hatched fall chick costs more than a hen-hatched spring chick. I wouldn't be sure that a hen-hatched fall chick costs more than an incubator-hatched spring chick, for hen-hatching is always cheaper. Neither would I be sure that a hen-raised fall chick costs more than a brooder-raised chick of any season, for hen-brooding costs much less than brooder-brooding. But we get into very deep water here and I shall have to be fished out if I am not careful.

What I started to say was that other things being equal, fall hatching costs more. Eggs are worth 35 cents in August and 40 (we hope) in September. In March and April the producer is lucky to get 25 cents. Fertility too is apt to be less strong in August and it is quite sure to be in September. These two items, fertility and price of eggs, make a noticeable difference between the cost of the fall and the spring chick.

There is still another item in this expense column. This is the fact that fall-hatched pullets never pay for their raising as soon as do spring pullets. The spring pullet that is hatched at the proper time should be in good laying trim by the first of November. (I am speaking of bred-to-lay pullets), and should lay 18 eggs a month from that time on. Suppose the eggs bring but 40 cents a dozen, she will pay for her raising in two months. The fall pullet on the other hand begins laying in the spring when eggs are 25 cents and hers will bring but 20 cents. Obviously it takes her twice as long to pay for her raising as it does the spring pullet.

Simply for egg production I should never hatch a fall chick. Fortunately there are other considerations.

Meat Brings More

The main reason for hatching chicks in September or October is that as fryers and broilers and roasters they find a much more profitable market in winter and early spring than in summer. Instead of the 17 or 18 cents a pound live weight which fryers bring in August, they will bring in January from 25 to 35 cents. I have received as high as 40 cents, but this was for broilers hatched in January. To get profitable prices it is almost necessary to hatch in the fall or winter.

Another question meets us here. Is there profit in hatching Leghorns in the fall just for the sake of these winter broilers? In the pens of a man who has made a great success with White Leghorns I noticed the last time I visited him a lot of Rhode Island Reds. When I remarked on their presence he said they were for winter broilers. Evidently he thought Leghorns not quite as profitable as they should be for this purpose. The trouble with the Leghorn seems to be that while it reaches the weight of one and one-half pounds as quickly as a Rock or a Red, it grows very slowly after that and is of little value as a fryer and worthless as a roaster. Far be it from me to "knock" the Leghorn. It is the one layer of commercial eggs that has stood the test of time. But eggs and meat are rarely produced in perfection by the same bird, and no one has ever claimed that the Leghorn was a table bird.

If I bred Leghorns and nothing else, and if I were obliged to do all my hatching and raising artificially, I should think a good while before I made up my mind to hatch in September, that is unless I really needed more layers or better layers.

Are September Pullets Better Layers?

How much is there in the contention that the fall-hatched pullet will be a better layer than the spring pullet because her mother is a better layer? I do not know. Among Leghorns the hen that lays in August is one of the better layers of the flock. Among heavy breeds she may be one of the better layers and she may be merely the hen that raised a brood in late spring and is just back on the job. But granting that the August layer is the choice layer, will her daughter be? Experiment stations have proved to their own satisfaction at least that fecundity passes through the male. If this is true the son of an August layer might be better qualified to pass on fecundity to his daughters than would a male hatched in the spring, but when we come to questions of heredity we are in very deep water again. It seems to me the only way to build up a laying strain is to find out exactly which are the best layers and breed them and from them alone. There has been too much guesswork in our poultry breeding.

One thing must however be said in favor of the fall pullet. She will not molt as early in the summer as the spring pullet. A spring pullet begins laying in the fall or winter and lays till the following August when she goes into molt. The September pullet begins laying in March and is likely to lay till December before she molts. She is therefore shelling out high-priced eggs while the pullets hatched five or six months earlier are resting. This is a great advantage and may balance the additional cost of the bird. I said "likely to lay" for there is some uncertainty about the molting of fall pullets. As often as not, may be a little more often, they lay till winter, but sometimes they disappoint us.

As to The Hen

When I think of September hatch-

ing, the picture that comes before my mind is a picture of a big, fluffy comfortable mother biddy sitting quietly on 15 eggs in the cool shade of a tree and coming off some hot day in September to hover her chicks in the shade of the same tree. It's little protection she needs then, and her chicks are in the open from dawn till sunset. The long fast makes her feathers drop quickly and completely, and while she cares for her babies she is growing her new coat. She ought to be laying by Thanksgiving, and this comfortable molt, with the complete rest, conserves her strength and vigor. I have a theory which I have not the data to prove, that a hen of the heavy breeds allowed to molt this way and to raise a brood in the spring ought to lay as many eggs in a year as a Leghorn and to keep her laying powers a year longer. That is, she ought to if she is not allowed to get fat. A two-year-old Rock or Orphington must be fed very carefully or she becomes too fat to lay.

Chicks Are More Easily Raised

Fall hatching is a matter par excellence for the heavy breeds. It is good for the mothers, splendid for the chicks and produces profitable table fowls. But it has its advantages even when artificial methods of hatching and brooding must be employed. The September chick needs no heat. A fireless brooder is the best of foster mothers. This makes cheaper brooding and healthier chicks, and there should be fewer losses. As the chick grows stronger the weather becomes cooler. This is a great advantage to the growing chick. Mites are less troublesome. With the first rains all sorts of green feed is at hand if the chick has range. If it has not the green feed is more easily grown than in summer. It is not without reason that fall in California is called our second spring.

Protection Necessary

But the September chick must have protection from the weather. Cold winds and rains may be expected in November and chicks of the lighter breeds feel this change greatly. Even chicks with hen mothers must be shielded from the wind. It is for this reason that I speak of the fall chick as a September chick. A chick hatched in September has six weeks of warm weather ahead of it in which to prepare for the cold. Two years ago a cold norther in November carried off a number of my October Buttercups. They were with a hen too. Had they been hatched a month earlier, or had they been Orphingtons, they could have weathered the storm but they were too young and too closely feathered. It is the birds with loose fluff that can endure sudden changes in temperature. By the time the winter rains set in a September-hatched bird is able to care for itself with any reasonable shelter; but it should have a dry place to scratch in and sleeping quarters that can be made rain-tight. I should not hatch a single chick that I could not make comfortable.

PRESERVING EGGS IN HOT SECTIONS

The price of eggs is going up, and it can be expected to continue to rise until it gets to about five cents per egg, and when your hens begin to lay it will drop again.

BABY CHICKS and EGGS

We will book your order for Chicks or Eggs for future delivery.
EXTRA SELECTED BLACK MINORCAS & WHITE LEGHORNS OUR SPECIALTY
Our Chicks are hatched in the
BEST VENTILATED HATCHERY IN CALIFORNIA
INSTRUCTIONS HOW TO RAISE CHICKS FREE

Hicks Jubilee Hatchery,

Eggs can be preserved by the use of a five per cent solution of Water Glass or Sodium Silicate and these used when the market price is high. One precaution, however, is necessary, preserve only infertile eggs, because others will start to hatch in our warm summer weather and when they are opened they will not be fit to use.—J. A. Armstrong, Farm Adviser, Maricopa County, Arizona.

Closing out Sale of Poultry Supplies

Regardless of cost

Great Big Bargains—for some of them see Poultry Columns of Classified Liners in Sunday papers. Come in and make us an offer for anything in the Store from a 10c package of Killamite to a Bone Mill or an Incubator.

West Coast Seed House

TREES

For Sale or Trade—Valencias and Washington Navel. Gilt edge property, forty acres situated near Ducor, Tulare County. 12 acres three years old next spring; 18 acres two years old next spring; and 10 acres unplanted. Water from wells, under economical arrangement. Property in first class condition and has always been given expert care. Deal direct with owner. Answer Box 10, California Cultivator.

Chase Walnut Trees, grafted on black walnut root. First-class stock. They will make you money. Write for circular and price. Also seedling trees grown from the original CHASE tree. Magnolia Nursery, Whittier, Cal.

For Acacias, Avocados, Budded Loquats, Citrus trees, Evergreens, Feijoas, Palms, Roses and all kinds of trees, shrubs, vines, etc. Write for our new catalogue. Robertson Nurseries, Fullerton, Cal.

Walnut Trees—Eureka and El Monte varieties a specialty; also Franquette and Placentia. Write for prices and description of stock. Personal inspection invited. Eureka Walnut Nursery, Montebello, Cal.

For Sale—Eureka Walnut Trees, budded on Native Black Walnuts. Choice stock. Order immediately. Don't delay. Wm. Holbe, Fullerton, Cal.

Nurseries—Pot grown conifers, palms, shrubs and ferns for lining out or potting. Palms Nursery, Pasadena, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale. Inspection invited.

MACHINERY

USED RANCH MACHINERY, PUMPS, WINDMILLS, TANKS, ENGINES, HAY MACHINERY, PUMPING PLANTS, TANKS, TANKS, TANKS, WHY BUY NEW? SAVE HALF. MATERIAL GUARANTEED. PUMPS, PIPE, CYLINDERS, RODS. DEAL WITH RELIABLE FIRM, 15 YEARS IN BUSINESS, CHEAPEST IN CITY. DEMMITT CO., 120 N. Main, Los Angeles.

For Sale—Used and new Gas Engines, 2 H. P. up, rebuilt and fitted with modern equipment. 22 years' experience enables us to repair and rebuild Gas Engines correctly. Get prices. Lloyd, 806-808 N. Main St. Los Angeles. F7020—Broadway 4103.

Buy Gas Engines Right—We sell direct at agent's price. Heavy duty, ruggedly built engines that stand up. Get new engines at used engine prices. Let us tell more about it. T. W. Hobron Co., 126 Lick Bldg., San Francisco.

For Sale—Windmills, engines, tanks, pipe, horses, wagons, harness. We install your outfit. Will buy anything you have. Ranchers' Exchange, 1630 So. Main St. Machinery of Every Description Bought and sold—Buttress & McClellan, 205-207 N. Los Angeles street, Los Angeles. Broadway 8098; A5473.

POULTRY

Save Dollars in Feeding—Every Poultryman, whose flock numbers a dozen or thousands should have the three formulas of foods, which I here offer. They are the results of years of successful experience in feeding poultry. They are not concentrated foods or stimulants, but three proper combinations of grains, seeds, meals and other ingredients to form balanced rations for baby chicks growing and laying hens. Your fowls will appreciate a trial of these foods. You will know what they are eating, which you do not know when buying ready mixed foods, and the saving and results will be very gratifying to you. Start feeding now for more eggs. I send the three formulas with directions for mixing, and suggestions for feeding to any address upon receipt of one dollar, currency or Money Order. GEO. A. HORNING, 2034 West 29th Place, Los Angeles, Calif.

Just Out—The Cultivator Poultry Book. "Poultry for Profit," by Jean A. Koethen. Published by the Cultivator Publishing Co. Highly endorsed by experts. Over 200 pages, 50 illustrations. Contains simple methods of avoiding and overcoming difficulties. A guide to poultry success under Western conditions—it tells what to do, why to do it, and how to do it. Nicely bound in cloth. Price \$1.00 postpaid, or with Cultivator one year, \$1.75. Send orders to Cultivator Publishing Co., 115-117 North Broadway, Los Angeles, Cal.

Baby Chicks—Rhode Island Reds and White Leghorns I guarantee safe arrival of a full count of strong, vigorous chicks. I can please you if you will give me your order. Fall chicks are easy to raise and do well. J. W. Lyon, Gardena, Calif.

Poultry Wanted—We pay the highest market price for the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We recruit immediately. National Poultry Co., 607 E. Third St., Los Angeles, Cal.

Fall Delivery—White Minorca (the best all purpose fowl) and Golden Buff Leghorn baby chicks and eggs—get your chicks and be ready—the poultry business is going to flourish from now on. Sandridge Hatchery, Kerman, Calif.

Baby Chicks—Electric Hatched. White Leghorns, R. I. Reds, Barred Rocks and Black Minorcas. We are booking orders for Fall delivery. THE ORLAND HATCHERY, Orland, Glenn Co., Calif.

First-Class Chix—White, Brown Leghorns, R. I. Reds, B. P. Rocks, Buff Orpingtons for September and later. Stock guaranteed. Hawkeye Hatchery, Turlock, Cal.

DUCKS

Ducks—High class Mammoth Imperial Pekin Ducks for breeders. Best stock in California. Stone Canyon Poultry Farm, near Sawtelle, Calif. P. O. address Sawtelle, Sunset Phone, Santa Monica 565-M.

KODAK FINISHING

Developing, 10c per roll. Printing, 2 1/2 x 3 1/4, 2 1/2 c; 2 1/2 x 4 1/4, 3c; 3 1/2 x 4 1/4, 3c; 3 1/2 x 5 1/4, 4c. Denver Street, 706 S. Hill St., Los Angeles.

LIVE STOCK

I have another crop of seventy-five head of BIG TYPE POLAND CHINA BOARS, born in February, sired by IOWA WONDER, who is a son of A WONDER, the GREATEST POLAND CHINA BOAR, LIVING OR DEAD. IOWA WONDER is in the 1000-LB. CLASS. One of his sons from one of my good registered sows should make YOU MONEY. I will sell the best first. On account of being overstocked will sell them at \$20 each while they last, but they will not last long at this price, so ACT QUICK if you want an EXTRA GOOD BOAR FOR LITTLE MONEY. Geo. A. Smith, Corcoran, Cal.

Billiken Herd—Pure bred, pedigreed O. I. C. swine; the big white kind. Ready for immediate shipment; weaned pigs of both sexes; pairs and trios; mated not akin. All these pigs are from big type stock, of extra heavy bone; weight, with early maturing quality. Immunized against hog cholera; crated and registered free. Write for descriptive circular and price list. C. B. Cunningham, Mills, Sacramento County, California.

DUROC JERSEY BOARS

Trios of boar and sows not akin of the best blood lines at reasonable prices. Write me. L. L. DeYoung, Sheldon, Ia.

Del Dayo Farm (Old Haggin Bottom Ranch) Registered Berkshires, both sexes and from weanlings to one year old. Now ready a few choice Gilts safe in pig and some very choice 10 mos. old Boars and every sale absolutely guaranteed satisfaction. Stephen S. Day, Sacramento, Cal.

Milch Goats—I have a bunch of graded Toggenberg milch goats; one doe six years old, a fine milker—three does each two years old, and four kids does each six months old. All from same strain. Will sell the bunch very reasonably. For particulars and price address Walter Bowen, Route No. 3, Modesto, Cal.

Bella Vista Stock Ranch has choice Guernsey dairy stock and exceptional Hampshire hogs. My herds are headed by Grand and Jr. Champions; young Guernsey bulls from producing dams and weanling Hampshire pigs on sale. J. W. Henderson, 522 1st Nat'l Bank, Berkeley, Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. B. blood. BERKSHIRE HOGS. Finest bred in the state. All ages for sale. A. B. Humphrey, proprietor. Mayhews, Sacramento Co., California.

Cholera Immune Berkshire Pigs—All ages. Registered Holstein bull. Prairie Pieterje 107062, three years old—gentle and guaranteed. Selling to avoid inbreeding—\$300.00. Ricconi Bros., Mountain View.

Hornless Toggenberg Buck, handsomely marked, 1/2 blood, imported "Prince Bismarck" strain; 6 months old, make grand breeder; mother fine milker. Kirkpatrick, 312 West 98th Street, Los Angeles.

For Sale—Registered, Berkshires. 25 choice pigs of best breeding from the best strains in America. For prices and description address H. L. Murphy, Perkins, Sacramento Co., Cal.

For Sale—A Saanen Buck, two years and four months old, large, white, born hornless, fertile, thoroughbred, registered. Price \$75.00. John Stewart, Box 27, Mentone, Cal.

Blue Ribbon Herd Duroc-Jersey Hogs, Service Boars and Bred Gilts a specialty; also boar and two sows, not related. Meet me in S. F., 1915, prices. John P. Daggs, Modesto, California.

For Sale—At all times, Jacks and Stallions, driving and saddle horses. Price and stock guaranteed. Phillips and Kingsbury, 2218 G Street, Sacramento.

Pure Blood Toggenberg Bucks—Registered. An exceptional opportunity to get the best milk stock. H. W. Shepard, National City, Calif.

Berkshires—Pedigreed Boars ready for service. Bred sows, weanling pigs, both grade and thoroughbred, finest stock. C. H. Thompson, Novato, Cal.

Calves Raised Without Milk—Cost less than half as much as the milk raised calves. Write for free book to Coulson Co., Petaluma, Calif.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

SEEDS AND PLANTS

Burbank Spineless Cactus—Hardest varieties, "Melrose" and "Special." Strong, matured slabs, \$8.50 per 100; \$50 per 1,000. Labranza Ranch, Athlone, Merced Co., Cal.

For Poultry Feed, Grind Cactus; for Cattle and hogs, chop cactus; sprinkle both with bran. Get our prices. Luther Burbank Spineless Cactus Plantations, SAN DIMAS, CAL., Covina phone 902.

Genuine Burbank Spineless Cactus—Strong mature slabs, \$3 per 100—\$25 per 1000. Thos. Cathers, Morgan Hill, Cal.

MUSICAL INSTRUMENTS

We repair, buy, sell and exchange musical instruments; used instruments, good as new, sold cheap. Write for bargain list. Bolander's Fiddle Hospital, 52 Second street, San Francisco.

FARM LANDS FOR SALE

The owner of 3000 acres near Madera desires to subdivide for real settlers; the land is typical San Joaquin valley loam, free from alkali, and will grow anything; railroad crosses property and there is abundant water at shallow depth; the land is for sale at the right figure to people with proper qualifications; no cash payment down and terms to suit, provided the purchaser has sufficient money to put the land under water. Remember that there are no real estate commissions to pay to swell the price of the land; all the owner wishes is interest on his money. No real estate agents need apply. GREENE ESTATE COMPANY, 207-208 Berkeley Bank Building, Berkeley, Cal.

Carlsbad Irrigated lands—bordering ocean; on State paved highway and Santa Fe Ry., 80 miles south of Los Angeles. Government records show Carlsbad warmest in winter, coolest in summer of any spot in California. Deep soil, model water system, low rates. Lemons mature in summer when price is highest. Immense profits in fruits and berries adaptable to coast territory. Winter vegetables without competition. Minimum temperature 1914 was 41 degrees. Tomatoes, chili, peas, beans, eggplant, rhubarb, etc., bring \$150 to \$400 per acre. Easy purchase terms. Liberal leases. SOUTH COAST LAND CO., GEORGE BUXTON, SALES AGENT, CARLSBAD, CAL.

State Map Showing School Land in different counties of the State, plainly marked, \$2.50. County sectional maps, showing vacant GOVERNMENT Land, plainly marked, \$2.50 each. Order TODAY. Booklet, FREE. Joseph Clark, Sacramento.

For Sale—Tulare 40 acre dairy and hog ranch, 3 miles from Tulare, 1/2 mile to school on oil road and R. F. D.; good pumping plant, house, barn, outbuildings. Will give good terms; might consider part trade. For particulars address Box H, care Cultivator.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale or Exchange for Southern California acreage, 4 acres fine bulb or vegetable land in city of Santa Cruz. William Richard, owner, 438 River St., Santa Cruz, Cal.

Do you want a hog ranch? If so and you have a little money, write for my proposition to start you. E. A. Stephens, 945 Orange St., Los Angeles.

For Sale—160 acres, some improvements, new pumping plant, some alfalfa. A good place for a dairy and hogs. Angie Bell, San Miguel, Calif.

Wanted—About seventy-five young men and women to enter The WESTERN NORMAL on August 30th, to prepare for teaching. Western Normal graduates secure and hold good positions. We assist graduates to secure good positions and promotion. We save you time and money. For information, address, WESTERN NORMAL, J. R. Humphreys, Principal, Stockton, Cal. 634 E. Main St.

Telegraphy—Stenography, bookkeeping, English branches. Positions guaranteed. Mackay Business College, Los Angeles.

RABBITS

Leading Rabbitry in America—Flemish Giants a specialty. Prize winning and heavy weight stock. Scored and sold on their merits. Inquiry and inspection solicited. Catalogue on request. Empire Rabbitry, Empire, Cal.

Mt. Diablo Rabbitry—"New Zealand Reds," imported stock; no culls; prices right. State your wants. Box 117, Concord, Cal.

WANTED

Wanted—Home in country for 10-year-old orphan boy. Is well trained, industrious, bright, strong and quiet. Needs a mother's and father's interest. Will adopt to right people. H. H. Eshelman, Soldiers' Home, Cal.

Wanted—Man to work 45 acre young Valencia grove near Orange, on salary, cash or share basis. Must loan me \$1000.00 or take part interest in grove for labor or other property. Herbert F. Clark, 31 N. Granada, Alhambra, Cal.

Farm Hand who can drive car, truck or team, understands gas engines, centrifugal pumps, irrigation and general farming, could take care small place, wants long time job. Have reference. Address V. C. care of Chas. Wiro, Chowchilla, Cal.

Combined stenographer and choreman, competent, business experience, run gas engine; sober, industrious, now employed; wants engagement on or before November 1st. Good references, furnish bond if desired. Address Box L, care Cultivator.

Wanted to hear from owner of Farm or Fruit Ranch for sale. O. O. Mattson, Minneapolis, Minn.

Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Injured Eye

I have a mare that lost an eye some time ago. The eyeball is entirely gone and the eye has been discharging matter ever since. A few weeks ago a growth commenced and has grown until it fills the eyesocket and is as large as a walnut on the outside. The eye is discharging all the time and has a very disagreeable smell. Kindly inform me what can be done for it.—Subscriber, Earlimart.

You think the eye is entirely gone but probably the fluids have only run out and a tumor has grown in their place. The only way to relieve it will be to have the eye entirely removed. That can only be done by one who understands the anatomy of the eye. If it is done properly it will soon heal and give you no more trouble.

Congestion of Udder

I have a four-year-old cow that came fresh April 1st with her third calf. Has always been a heavy milker. About two months ago I found one quarter of the udder hard but at next milking it was normal and the milk was stringy. A few days later it occurred again and acted as before. This has happened several times, sometimes in one quarter and sometimes in another. Pasture her on alfalfa and feed her alfalfa and sorghum in corral. The milk flow has diminished considerably.—Subscriber, Earlimart.

The curdled milk is caused by congestion of the udder. The congested udder indicates heavy feeding and a clogged system. Relieve the system and thin the blood by giving a physic of aloin four drams, turpentine two ounces and raw linseed oil one pint. Mix and give at one dose. Follow this by giving a handful of epsom salts in the feed once a day for two weeks.

Cows Poisoned on Milo

Four weeks ago I turned seven cows into a field of half-grown milo that

looked too dry to mature corn. For two weeks cows did well and gained on flow of milk. About this time three of the cows showed signs of weakness in hind legs, one cow wanted to urinate very often. Cows were immediately taken from the milo. Two got all right in a few days but the one that wanted to urinate so often continues to do so. Gave her some kidney capsules but derived no benefit. She humps up and strains but urine only comes a few drops at a time. Appetite is good but she is quite thin. Can you tell me what to do for her? Is the milk all right to use?—Subscriber, Chowchilla.

When milo or millet is only partially matured cattle seem to like it and will eat very freely of it. The partly matured seed or some part of the plant will sometimes affect cattle as you describe. When the crop is cut in that stage and made into hay it is also inclined to affect the kidneys but if left to ripen it makes better feed. Linseed tea is best to relieve the kidney trouble. Use ground flaxseed with the oil in. Put a pint of it in a bucket and pour on a gallon of hot water. Let stand until cool, then fill the bucket with cold water and let the cow drink

it. Repeat this twice a day and it will probably relieve the trouble in a few days. The milk will be all right as soon as she is relieved.

Cows Sick

I am writing for advice in treating sickness in cows. Have had two cases almost similar. One quarter of the cow's udder becomes caked, is very tender to the touch and in 12 hours they are down and unable to rise for about 36 hours. Then they get up with difficulty but commence eating and improve right along. Seem to be partially paralyzed or very weak. Gave several doses of epsom salts, then several doses of salt petre and rubbed udder with soap liniment. Am feeding green alfalfa night and morning, green corn stalks at noon with alfalfa hay in racks in corral. Please give cause, prevention and treatment if possible.—Subscriber, Riverside.

Unable to name the disease or the cause. Am inclined to think that the heavy feeding and possibly some weeds in the hay are the cause. Your treatment seems to have done all right. Would advise reducing the feed and giving a handful of epsom salts occasionally.

insect powder of various kinds but the ants still come.—Subscriber.

It is probable the nests of these ants are in holes in the ground near the hutches. A little carbon bisulphide poured down these hills will probably lessen the nuisance. Even boiling water is a help. By exercising a little patience, you can follow the trail from the infested place to the nests. In the hutches we would use buhach freely, making sure that it is fresh. In order to make sure that it is fresh buy in the original cans. Its effectiveness lasts only for a day or two when it loses its repelling power, but continued use of the powder, if fresh, will keep the ants away.

Enlarged Crop

Two young turkeys had their crops enlarged until they hung like bags. Not much in them but water which ran out when I held them by the legs.—Subscriber, Ceres.

Enlarged, or as it is sometimes called pendulous, crop is generally caused by too heavy feeding without sufficient intervals between meals and without sufficient exercise. Turkeys seem to be especially subject to it, probably because they are apt to be greedy and are less able than chickens to digest large quantities of food. It is sometimes possible to cure these cases by bandaging the crop. Wrap a small bandage, not too tightly, about the crop and the neck in such a way that the crop is supported, and see that the birds do not eat too heavily for a while. If they have fairly good range a little wheat at night will be all they need and they will be all the better off if they are obliged to hunt for their food. If the bandage does not relieve the trouble, you may have to resort to this operation, which is recommended by Dr. Sanborn: Cut out of the enlarged portion of the crop a diamond or oval-shaped piece of tissue two inches long and one inch wide. Sew the edges together and wash out the crop thoroughly with clean, warm water. The edges of the wound should be well greased with vaseline. I have not tried this operation and I should not like to try it, for these things are always more difficult than they appear on the surface. If bandaging and careful dieting did not relieve those birds I should get them to market as soon as possible and be careful that the rest of the flock eat less and exercise more.—J. A. K.

Intestinal Trouble

Hen staggers about. Sometimes can walk a few feet before she falls.—Subscriber, Ceres.

I think your hen has some intestinal trouble, either a mild case of ptomaine poisoning from eating spoiled or putrefying food, or possibly worms. The first thing to do is to clean out the intestines with a laxative (two teaspoons castor oil, 30 grains of Epsom salts given in water, or one and one-half grains of calomel). Keep her in a cool quiet place and try to find out the cause. If you find worms in the droppings after the laxative, give 20 to 30 drops of oil of turpentine mixed with an equal quantity of olive oil, and follow this in two hours with two to three teaspoons of castor oil. Treatment for worms should always be given when the crop is empty.—J. A. K.

WILLIE'S COME DOWN

Little Willie, after flattening his nose against the outside of the baker's window for about half an hour, at last entered with his mind evidently made up.

"I want to know," he said in a deter-

mined yet hopeful voice, "how much those wedding cakes are?"

"Well," answered the enterprising proprietor, "I have them at all prices. Tell your mother that I can do her a beauty for \$20. The cheapest is \$10."

"Ah, well," he murmured, in a resigned voice, "let me have one of those one-cent gingerbread rabbits."—Galtimore American.

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeney, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is warranted to give satisfaction. Price \$1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Temporary Windbreak

What is the best temporary windbreak for the Coachella Valley? Am up on the slope and in a section comparatively free from frost.—Subscriber.

There is no variety of field corn with which we are acquainted which would answer your purpose. It may be, however, that you could use a rapid growing variety of sorghum. This would make a thick growth before the cold weather and if there was no hard freezing would keep its erect position fairly well all winter.

Either Early Amber or Kansas Orange sorghum should make rapid growth if sowed during the first part of September, but to get the best growth it should be planted in rows so it could have some cultivation for the first two months. The seed can likely be had at any good seed store.—J. B. N.

Pipe Capacity

What size of concrete pipe is necessary to carry 500 gallons of water per minute, slope seven feet to the mile?—Subscriber, Arroyo Grande.

A 12-inch pipe with the slope given will carry 550 gallons per minute.—J. B. N.

Moving Small Fruits

What is the best period of the year in which to move loganberries and dewberries?—Subscriber, Fillmore.

January and February are probably to be preferred, or at least a time when the plants are as nearly dormant as possible. Of course plants which have been produced by tipping may be planted later if growth starts.

Rations for Sows, Pigs and Fattening Hogs

I am raising hogs. Have them divided into three lots so as to separate brood sows, growing pigs and fattening hogs. I feed soaked barley, soaked milo, beets and alfalfa (green and dried). How should I divide the feed to the different lots so as to give each

the best ration?—R. A. H., Chandler, Arizona.

Answered by F. W. Woll, University Farm, Davis.

Excellent rations for brood sows, growing pigs and fattening hogs may be made up from the feeds given but as suggested the proportion of the various feeds will vary with the three groups of animals. The brood sows should receive all the feed necessary to keep them in a good body condition, and succulent feeds like beets, green alfalfa and dairy by-products, are of especial value because they favor the milk secretion. In addition, as much grain, say barley and milo, equal parts by weight, is fed as they will eat readily.

When a couple of weeks old the pigs are given some feed of their own in a small trough; the same grain mixture will do and the amount given is increased as rapidly as they are able to clean up more. If the sows and pigs are put on good alfalfa pasture less grain is required, but some grain must be fed to both classes to prevent the sows from getting too thin and to enable the pigs to make a more satisfactory growth.

Fattening hogs are fed similar rations as the sows, except that it is not always important to provide succulent feed, although it is quite desirable also in this case. In addition to hay and roots, they are fed grain, about 2 per cent of their body weight. The amount of grain fed must, however, depend on the prices of feed and the condition of the market. If the hogs are to be marketed within an early period the feeding must be more intensive than otherwise, but the amount given, about two per cent of the live weight of the hogs, per head daily, is a good average figure by which to be guided.

Ants in Rabbit Hutches

What will rid rabbit hutches of ants? Have thoroughly cleaned but that is ineffective. The mother does will not enter the nest to suckle the young and they soon die. Have used

The Many Uses of UNION CARBIDE and ACETYLENE

The Union Carbide Company is the largest user of industrial horsepower in the world.

Union Carbide is the granite-like material that yields acetylene gas. In the process of manufacture the power of Niagara Falls and the great rapids at Sault Ste. Marie is transformed into electric current, which in turn is changed into heat. This heat is used to maintain the highest temperature known to science in the hundreds of huge electric furnaces which turn out the Carbide.

The process of making Acetylene from Carbide is so simple it has brought this gas into world-wide use. Today tens of thousands of mine workers are wearing acetylene mine lamps on their caps—thousands of acetylene torches are illuminating big out-door construction projects—tens of thousands of automobiles are equipped with acetylene headlights—thousands of factories and machine shops are using oxy-acetylene metal cutting and welding torches—thousands of acetylene light-house buoys illuminate our sea coast. Others light the whole course of the Panama Canal.

And hundreds of thousands of country home families are using Home-made Acetylene for both lighting and cooking. The thousands of tons of Union Carbide used to make this acetylene is purchased direct from the Union Carbide Company's warehouses located at shipping points all over the country. In the hundred pound drums in which it is packed Union Carbide is as safe to ship, store and handle as coal. It won't burn and can't explode.

A GARDEN AT DUSK

When down my garden aisles I look
At twilight's hour, each bush and row,
Each thick grown spot, seems like a friend

Such as one loves to know.

Their dusky forms, in shade outlined,
Seem never strangers to my view
For closely side by side with them,
I've toiled the long hours through.

And as one grows to love a friend
Proved true through many busy days,
So do I love these friends who live
Among my garden ways.

When through the dusky aisles I stroll,
And plan the work that yet must be,
I know that I am welcome in
A friendly company.—Arthur Wallace Peach.

HOUSE FOR SALE

By Alice Louise Lee in Youth's Companion

MR. AND MRS. BILLY KEENAN sat in the living room of their little house on Stuyvesant Place — sometimes known as "Friendly Street."

"Billy," Mrs. Billy exclaimed from behind the Washington evening newspaper, "listen to this: 'House for sale. Six rooms and bath. Laundry in basement. Apply to J. H. Hamlin, 60 Stuyvesant Place.'"

She emerged from the folds of the paper.

"Why should they want to sell their house just when they've decided to adopt Mr. Hamlin's little nephew, Edwin?"

Billy Keenan's eyes twinkled as he looked at his wife's round, flushed face. "I don't know," he said, "but I prophesy that you'll find out within a week."

Mrs. Billy regarded her husband suspiciously for a moment, and then devoted herself again to the affairs of the nation's capital. The following day she had forgotten his prophecy, but within the week she had, nevertheless, fulfilled it.

When Billy came home on Saturday afternoon he found Mrs. Hamlin leaving his house, and Mrs. Billy, in a white voile dress with pink ribbon attachments, standing in the doorway, looking sympathetic, and, he thought, altogether attractive.

Mrs. Hamlin was a tall, nervous woman, with a thin, delicate face. At that moment her thin lips were pressed together unpleasantly, and her eyes had an aggressive expression.

When the door had closed behind the visitor, Mrs. Billy, with her face against her husband's broad shoulder, said in a muffled voice, "Billy, they have advertised their house for sale

because they simply can't endure this neighborhood any longer!"

"What!" cried Billy incredulously. "Not endure us? Why, we're the only real and original neighbors in Washington! She couldn't find a nicer or quieter spot than this little block. Some of the finest government men are here." Mr. Hamlin as well as Billy was devoted to "Uncle Sam's" interest in the Forestry Department. "There are Hone and Carter, for instance, who live next to them. Where will she find finer fellows than they?"

Mrs. Billy's eyes twinkled. "She knows those two men only as the fathers of a good-sized collection of badly managed children. And, Billy, did you mention 'quiet'? She says it would be less wearing on her nerves to live near a train yard than between those five young Carters and three Hones. She says Mr. Hamlin is determined that his nephew shall not associate with the little 'hoodlums,' as she calls them."

One afternoon not many days later, Billy walked home from the office with Mr. Hamlin, who for the first time became confidential in regard to his views of the street. And as if to substantiate those views, no sooner had they gained the corner of Stuyvesant Place than two Hones and three Carters came careering along the walk on roller skates. When directly opposite the two men, the youngest Hone lost control of his feet, and the sharp edge of his skate caught Mr. Hamlin just under the ankle bone.

"When he limped up his steps," said Billy to his wife, a few moments afterward, "I never saw a madder-looking man in my life! Of course the little hoodlums have no business to skate on the walks."

"Oh, I shall hear all about it tomorrow," said Mrs. Billy, laughing, "for I've promised to help Mrs. Hamlin get ready for Edwin. He comes the last of the week."

But when Mrs. Billy reached 60 Stuyvesant Place in the morning, she found Mrs. Hamlin absorbed in grievances of her own. The biggest Carter boy had fallen into her pansy bed from the top of the fence that divided the back yards.

"Was he hurt?" Mrs. Billy gasped. The solidly boarded dividing fence was at least twelve feet high.

Mrs. Hamlin choked. "I don't know. He has ruined the pansies. They look as if a steam roller had gone over them. I can't wait to get away from this awful street!"

Mrs. Billy tossed her small curly head, but did not reply. The two ascended the stairs to the airy front chamber, which overlooked the shady street.

"I hope," said Mrs. Hamlin, with a sigh, "I may be given strength and wisdom enough to bring little Edwin up well. I hope we shall find him quiet and gentlemanly, and considerate of other people's feelings and property."

Little Edwin was six years old. Presently there sounded on the street below the excited whoops and joyful yells of the five Carter children on one side and the three Hones on the other. A stiff breeze was blowing up the street, and soon outside the second-story window floated home-made kites of all shapes and in all stages of dilapidation.

"Oh! oh!" cried Mrs. Hamlin, with her head out of the window. "They've upset the jar of roses I put on the lower step; and there stands Mrs. Carter just beaming at them, and never noticing my roses. How can anyone be so thoughtless? If I could move tomorrow—" Here her voice was lost in the joyful shouts from below.

That night Mrs. Billy told Billy that she was growing nervous. "Somehow, when I'm with Mrs. Hamlin I hear the children's noises so much more plainly than I do anywhere else, and seeing her jump and start and fuss at them makes me jumpy, too."

"Then," said Billy, earnestly, "for the love of goodness stay away from Mrs. Hamlin!"

Mrs. Billy stayed away for two days. Then Mrs. Hamlin called to relate two items of overwhelming importance. Edwin was due to arrive that evening at 60 Stuyvesant Place, and the house had a prospective purchaser.

"It's a man by the name of Sherry," said Mrs. Hamlin. "He has a two weeks' option on it, and we're looking for an apartment. I want to take Edwin off the streets, so that he won't be killed or mangled by carts—and roller skates."

The evening was hot and sultry. Stuyvesant Place, leaving its windows open to catch any belated breeze that might blow, was sitting out on its doorsteps or in its tiny plots of grass; its eyes were turned expectantly toward Number 60. That is, the older members of the community sat in the manner described. The younger members were massed in front of Number 60, waiting to look Edwin over. He finally arrived in a closed taxicab, and was hastily conveyed in the arms of his uncle through the waiting ranks.

Billy, sitting on his own steps with Mrs. Billy, grinned broadly. His comments were tinged by a recollection of Mr. Hamlin's opinion of the street. "That was done with neatness and dispatch," said Billy. "The child is now beyond the contaminating influence of the Carters and Hones. His feet have not touched the pavement that theirs have trod. Wonder if they have a glass case for him yet?"

Fifteen minutes later Billy amended his last remark vigorously. "Cats and dogs! Talk about a noise! I wish the glass case were here—and he inside of it! Whe-w!"

The noise came from Number 60, and caused the inhabitants of the little street to hold their breaths. Finally Mrs. Hone and Mrs. Carter hastened down to the Billy Keenans.

"Isn't that racket awful?" said the mother of the riotous Carter five. "I can endure any amount of happy noise, but it makes me wild to hear a child cry like that."

"Of course neither of the Hamlins know anything about caring for such a baby," said the mother of the three mischievous Hones, "but we hesitate to go and offer our services because they—well, they're so unlike the rest of the street—not neighborly; and lately she has been positively snippy. But she comes to see you, and we thought we'd ask your advice. Would it do for us to offer—"

"Oh, yes!" interrupted Mrs. Billy eagerly. "Do go before that child splits his throat!"

"And our ears!" added Billy.

Mrs. Hone and Mrs. Carter hastened up the steps of Number 60, and disappeared. Presently the windows of Number 60 banged shut, and muffled the noise within. Soon Mrs. Carter appeared on the top step, and calling the smallest Hone and two young Carters, drove them into Number 60. Then quiet reigned.

An hour later two good Samaritans came down the street again to report progress to the neighborhood.

"There's nothing like children to comfort children," Mrs. Carter explained. "We left Edwin playing with ours. He seems more used to being with children than with grown people."

"The Hone and Carter hoodlums to the rescue!" exclaimed Billy, after the mothers had gone. "Will the Hamlins survive?"

The next afternoon, when Billy reached home, Mrs. Billy met him. "Billy, guess what's going on in the Hamlin house?"

"I hope that the little chap isn't going on as he did last night!"

Mrs. Billy chuckled. "No, but Mrs. Hamlin is so afraid he will that she has had the Carter and Hone children there all day. She's clinging to 'em as a drowning man clings to a straw. They are swarming all over her basement and back yard and front steps. Oh, the racket they are making! And I noticed that Edwin is the loudest one among them. But I think he is a lovable little fellow, and I can see that Mrs. Hamlin thinks so, too."

The option on the Hamlin property was five days old before Mrs. Billy again saw Mrs. Hamlin. Edwin's foster mother was standing in her front doorway. A smile hovered about her

lips and softened her eyes. She was watching a street parade by the neighboring children; Edwin was in the heart of the parade. A Carter grasped one hand, a Hone the other, and both a Hone and a Carter had affixed themselves firmly to the rear of his blouse. They occupied the middle of the highway. A milkman's cart approached, and, with the others, the diminutive Edwin lifted his voice in frantic commands to the driver to get out of the way. In her doorway Mrs. Hamlin fluttered nervously, and called:

"Why, Edwin darling! Is that the proper way to speak to the man?"

Edwin, not hearing, continued in his own form of aggressive address, and the parade, unhampered by further obstructions, swept noisily down the street. When the option was a week old Billy came home from his office laughing. "It's rich to hear old Hamlin," he declared. "He's got little Edwin's points down superfluous. It's really all he wants to talk about. I dropped into his office to tell him that I had heard of a good apartment at a bargain price, and he kept me there for an hour, telling me about the boy. You'd think Edwin was the only child ever born."

Mrs. Billy laughed. "Mrs. Hamlin shares his opinion, Billy. You see, they've discovered that Edwin is a very unusual child! Mrs. Hamlin admitted today that he was noisy, but said there was so much more character in his noise than in most children's that she hesitated to check him!"

When the option was ten days old Billy again walked up from the office with Mr. Hamlin, who carried under his arm an awkward package. Mr. Hamlin refused to divulge what the contents of the package were; but as they turned a corner, Billy accidentally knocked against him, and the bundle went to the pavement, the string broke, and out flew a pair of roller skates. Mr. Hamlin, smiling broadly, picked them up.

"Boys will be boys," he said, cheerfully, "and nothing would do but Edwin must have roller skates. Now I'll have a dickens of a time teaching him how to use them!"

The "dickens of a time" began that very evening, when Edwin and his teacher occupied a large area of the sidewalk in front of Number 60, and the passers-by prudently took to the middle of the street. Mrs. Hamlin,

wholly unaware of the discomfort of the passers-by, sat on the top step eagerly exchanging views on child culture with Mrs. Hone and Mrs. Carter. Billy Keenan looked at Mrs. Billy, whistled softly, and remarked that if anyone said that a leopard could not change its spots, please refer that person to William Keenan!

The day that the option expired, Mr. and Mrs. Hamlin came to call on the Keenans, and brought Edwin with them. Conversation was difficult. When Mr. Hamlin was not straightening the child's collar, Mrs. Hamlin was reknitting his tie; occasionally they combined their efforts to keep him from climbing on the piano or pounding the glass in the bookcase.

Suddenly Mr. Hamlin, removing his eyes for an instant from his heir, saw a man passing the bay window.

"Bless me, it's Sherry!" he said, making a dive for the door and the holder of the option.

When he had finished his conversation with Mr. Sherry, he found his wife and Edwin awaiting him on the Keenan doorsteps. In the doorway stood Mr. and Mrs. Billy.

"Don't believe we've told you that we've changed our minds about selling," Mr. Hamlin remarked to the doorway. Then, with the complacent self-assertion of one who announces original discoveries, he added, "This is such a quiet street to bring the boy up in, so few trucks or autos to look out for, and a kindergarten so handy—it seems foolish to move out. Good, friendly, helpful neighborhood, too—none better!"

Mrs. Billy gasped; Billy coughed; but the Hamlins heard nothing and saw nothing except Edwin, who buried his sleepy face in his new mother's skirt. A smile lighted her thin face, and made it look sweet and motherly.

"I feel so safe when he is out playing with the Carters and Hones," she said, in further explanation. "They take such excellent care of him, and with Mrs. Carter and Mrs. Hone next door in case of colic or croup—ah, no, we shall not sell!"

HOW TO CAN BEANS FOR WINTER USE

Green beans, which are so plentiful at present, may be canned easily. The home economics department of the University of Missouri at Columbia tells how to can them. In preparation wash and string the beans as if for immediate use. Next pack them in jars as tightly as possible, covering with water and adding a teaspoon of salt to each quart. Put on the rubbers and tops, adjusting loosely, then place on a rack of some sort or layer of straw in the bottom of a boiler and cover with clean water. Boil for two hours, counting from the time the water begins to boil. Remove from the water and seal immediately.

The best jar for this purpose is one that fastens with a wire spring. In using this style of jar the glass tops are put in place, held on loosely with the wire passing over the top. After removing from the hot water the wire spring is tightened, thus sealing the jar. The reason for sealing while hot is that steam, not air, will be contained in the jar. This steam condenses when the jar cools and leaves a vacuum which holds on the top of the jar.

The jar should be tested from day to day by releasing the spring. You should be able to lift the weight of the jar by the glass top. If the top loosens when this is tried the sealing is imperfect or the contents of the jar is spoiling. If the spoiling has not gone too far, the contents of the jar can be resealed in the same way as at the beginning.

ON TIME

This truth I'm spreading near and far, by means of loosed rhyme: You'd better do without a car than buy a car on time. Who are the folks who fume and fret, the while their bosoms bleed? They are the ones who go in debt for things they do not need. Their names will fill a catalogue in this debt-ridden clime; you'd better do without a horse than buy a horse on time. How happy is the man who knows he does not owe a bone! The grosser sorts of griefs and woes are leaving him alone; the "charge it" course he won't indorse, nor owe a man a dime; you'd better do without a dog than buy a dog on time.

"John"

"We are almost out of chocolate. Get a 3-lb. can of Ghirardelli's Ground Chocolate. Don't buy the bulk kind."

And John "obeyed orders" cheerfully, for of all the members of the household, John, the "boss," likes his breakfast cup of Ghirardelli's the most.

He knows what a delicious, sustaining beverage it is, what wonderful cakes, puddings and cookies his wife makes with its aid. He also knows that it gives the highest food value for the man who works hard, for the woman who must always be well, for children on the grow.

Order from Your Grocer Today

The Great Home Builder

WHAT after all is more worth while than bringing comfort and safety into the home? Think what the telephone has done to tie the country house to the town and the town to the city. Don't be isolated. Get into touch with the voice of the big outside world. Know the prices that rule on farm products. Know about the party at your neighbor's house. Bring to your whole family the safety that comes with the knowledge that in the time of illness or fire the whole community is within call.

Kellogg Telephones

have won their way into homes all over America because of the quality of service they give. Did you know there is a big difference in telephones? There is. Kellogg phones have to undergo an inspection more rigid than other makes. They pass through 37 distinct tests before they leave the factory. That means dollars and cents to you.

As a matter of fact, it is not uncommon for the repairs to cheaper telephones to cost in a few years more than the first cost. Kellogg instruments go on year after year carrying the most delicate sounds perfectly without repairs.

Kellogg Transmitter is guaranteed for five years. A Kellogg lightning protector goes with every phone.

Every part of the instrument is strong, simple and durable. Big, powerful generator that will ring efficiently with 40 telephones on the line. Unbreakable receiver and transmitter mouthpiece. Long life batteries. Secret service push button to ring "Central" without ringing your neighbors.

Let us help you in planning your line. We can tell you how to avoid mistakes and save money. Our expert help costs you nothing.

HAY

Under date of August 28, 1915, Scott, Magnus & Miller say:

Arrivals for the week ending today amounted to 4100 tons. The market is being well maintained. Fancy hay commands topmost figures and is readily placed. Medium types have not moved off quite as readily although demand for this type is better than it has been. A number of the larger consumers are now filling their lots for winter use and others are in the market at the present time negotiating for purchases for this purpose.

Considerable hay has moved for export in various directions and this trade has taken large quantities out of our market.

The alfalfa situation remains practically unchanged excepting that many producers who have not yet sold are holding at a little better figure than prevailed on the earlier cuttings. What alfalfa has come into our markets has been readily taken at full figures.

We quote the average wholesale price of hay in carload lots on today's market as follows:

Fancy Wheat Hay (lt. bales)	13.50@14.50
No. 1 Wheat or Wheat and Oat	11.50@12.50
No. 2 Wheat or Wheat and Oat	8.50@10.00
Choice Tame Oat	11.50@12.50
Other Tame Oat	9.00@10.50
Barley	8.00@10.00
Wild Oat	7.00@9.00
Alfalfa	8.00@11.00
Stock Hay	5.00@5.50
No. 1 Barley Straw	25 @ 40

GRAIN

Alfalfa Seed	16 1/2
Wheat, Cal. Club	1.60 @ 1.62 1/2

Citrus Fruit Market

LOS ANGELES, September 1, 1915.

The orange market remains strong; there is slight indifference as to low quality stock, but all good fruit is commanding most satisfactory prices. There are yet to go about 1600 cars, and as there is fully ten weeks before new stock navels will be seeking market, these should be taken at satisfactory prices.

On the contrary lemons now promise to close the most disastrous season in many years. There is hardly a redeeming feature in the entire season's market. Some fruit is being shipped to factories for manufacture of citrate of lime; some of the best is being shipped; and some is not being picked at all. Many lemon growers will be compelled to wait another year before getting the cost of this year's orchard care.

Shipments

Shipments of oranges from Southern California to date, 31,299 cars, lemons 6105, total 37,404. To same date last season: oranges 36,535, lemons 2666, total 39,201. From Tulare County: oranges 5649, lemons 202, total 5851. To same date last season: oranges 5875, lemons 32, total 5907. From northern counties: oranges 630, lemons 2. To same date last season: oranges 404, lemons 5.

NEW YORK, Aug. 30.—Ten cars Valencia, four cars lemons, two mixed cars sold. The market unchanged on Valencia, lemons higher on best grades, unchanged on poor stock. Partly cloudy.

FARM BUREAUS

(Continued from Page 225)

ering these industries. Returns from the Orland farm center show 3390 hogs signed up for a swine growers' association and 2820 dairy animals have been signed for the dairymen's organization. Reports from other farm centers in the county have not yet been assembled though will be ready in due time.

Numbers demonstrations throughout the county with Sudan grass indicate the entire success of this plant as a field crop. Sudan grass under irri-

gation makes exceptional growth.

Through the activity of the farm bureau aided by Dr. Cady of the bureau of animal industry, and with the cooperation of Dr. Jensen, county livestock inspector, hog cholera has been brought under complete control in Glenn County at the present writing.

Since the organization of the county farm bureau, covering a period of twenty weeks, the Farm Adviser of Glenn County has made 346 calls on farmers, has held 59 meetings at which 4628 people were in attendance, and has carried on 57 field demonstrations on various farms in the county. The distance traveled has been 6003 miles. Aside from farm visits and demonstrations, county-wide movements for the control of storm water on farm lands, for the betterment of telephone and electrical power service to farmers, and for the formation of hog growers, and dairymen's organizations, have been successfully undertaken. In this work the farmers of the county have played a most important part.

GREAT POSSIBILITIES

The total area of California is approximately 100,000,000 acres. According to conservative estimates, based on the irrigation census of 1902, 2,000,000 of those acres are being watered at this time. This statement however does not convey a true idea of the relative importance of irrigation to agriculture in California. Only 14,000,000 acres, or about one-seventh of the total area, is valley agricultural land, so that the 2,000,000 acres irrigated comprise one-seventh of the irrigable land of the state. This estimate does not include the tillable upper mesas and mountain valleys, both of which contain large areas of irrigable land. Nearly one-quarter of all the irrigated land in the United States

is in California, and this state ranks first in the total number of irrigated farms and in the total construction cost of systems. The highest priced irrigated land in America is found in California, and in no other state has water for irrigation reached so high a value or been so carefully and so economically used. And in no other state is there so great an area of fertile farming land for which the available supply is so large.

Irrigation development, like any other, has followed the lines of most evident financial returns. So it is that the localities of least annual and summer rainfall were the first to be reclaimed by the use of water. The tide of irrigation, however, has been moving steadily northward, and, excepting in the mountainous sections and the sections of excessive rainfall, the necessity for irrigation, or at least the value of it where it is not a complete necessity, is almost universally recognized. While heretofore, then, irrigation has followed the line of most evident return, in the future it will follow the available water supply.

The supply in the larger streams as measured by the United States geological survey is given for the past four to six years as 45,160,000 acre-feet.

Leaving out of consideration the water supply available in the creeks and smaller rivers, 45,000,000 acre-feet of water is sufficient to cover the 14,000,000 acres of agricultural land in California to a depth of over 38 inches, which is ample for the growth of all crops. The vast quantity of water can never be entirely utilized in irrigation, because it cannot be fully controlled, but the statement of it shows the tremendous potentialities of California irrigated agriculture.

HAWLEY, KING & COMPANY

In referring in last week's issue to the retiring of Hawley, King & Company from the farm implement business, especially as to the connection of Mr. F. W. King with the company, we should have said that the firm of Hawley, King & Company will continue handling automobiles at 1027-33 South Olive street, Los Angeles. The concern will continue its agency for the Oakland, National and Saxon cars. We hope the record for good service made by this concern will be continued for many years.

"Big Bull"

A POWERFUL COMBINATION

TRACTOR AND PORTABLE ENGINE

Before you consider buying an ORDINARY gasoline engine, find out what BIG BULL can do on your farm. Here is a strong, efficient, many-purpose power plant that not only does all your plowing, discing, and seeding, but runs manure spreaders, draws heavily loaded wagons, pulls hay leaders, mowers, binders, runs corn shellers, feed grinders, small shredders, threshers, and ensilage cutters. Practically no limit to the BIG BULL's capacity. Hitch it up to ANY machinery you now own. Don't buy any new equipment. Big Bull will drill wells, pump water, saw wood—anything small or great about the farm where CHEAP power is demanded!

One man and Big Bull easily do the work of several horses and hired hands. Big Bull does all your traction work—does it faster, better and MUCH cheaper than horses can possibly do it. The time alone gained by using Big Bull to cut their grain saved Lovegreen Bros., Ada & Linn, last year the price of their machine in JUST ONE HARVEST! Thousands of other old-time farmers are adding new profits, eliminating the unnecessary costs of horse-drawn farm implements and raising the value of their acres by keeping them in perfect crop condition!

Costs less than
a Stationary
Engine of
Equal
Efficiency

\$585

F. O. B.
Minneapolis,
Minn.

BIG BULL is out of the experimental class. Thousands of Big Bulls now used. Severest tests in all kinds of soils prove just one thing:—That Big Bull is the perfected, the proven, the best light tractor for GENERAL FARM USE!

You can't duplicate our tractor service anywhere on the Pacific Coast! We offer you a PROVEN all-purpose tractor and portable engine at the record breaking price of \$585—we carry every part of Big Bull right here in stock all the time—we can give you valuable special information about how Big Bull will best work in your particular type of soil.

THOUSANDS NOW IN USE. A BIG, PROVEN MONEY MAKER FOR 2 YEARS. COMPLETE PARTS KEPT IN ALL OUR PACIFIC COAST BRANCHES.

If you'll only LEARN how Big Bull works, and how much more profitably you can handle every crop, you will certainly want a Big Bull. Note these few big points:—The bullwheel runs IN THE FURROW, and this means crop increase. This one exclusive feature is the most sensational tractor improvement ever devised. It makes Big Bull a deep-tilling machine, a tractor that DOES NOT pack the soil. Grouzers on the bullwheel penetrate into the ground 4 inches deeper than the plowshare cuts, and tear and loosen the soil as thoroughly as the plow could. Hard subsoil, even hardpan, is completely penetrated and made ready for irrigation.

EIGHT CYLINDER KING

TOURING CAR
and ROADSTER

Too Successful to Change this Year

The extraordinary demand for this pioneer Eight and its year's mechanical advance over all competition make it unnecessary for the King Company to stimulate sales by mid-year change of price or model.

WE are fortunate in having produced a car which enables us to break away from the trade's demoralizing practice of sudden and unseasonable announcements, which cause quick depreciation of all cars purchased during the first half of the year.

Therefore, the King Company announces this new policy for the protection of King owners and dealers: No change of price or model this year. No mid-year announcements. Either ample notice to dealers of any new announcement affecting prevailing model, or, rebate on all cars still unsold which were shipped thirty days prior to such announcement. No sacrifice of King quality for mere price reduction—but always a high grade car at a price that gives big value.

The King Eight has delivered since January and was on the trial road three months before. It is now giving the very highest satisfaction to hundreds of owners all over America and is operating in eighteen foreign countries, there being 200 in England alone. The motor is truly an engineering marvel—a statement which will lose its boastfulness after your first ride.

Mechanically a year in advance, yet proved right by thousands of miles of operation, this car is the purchase of wisdom. It will grow old slowly. It will out-perform all other types. It will show amazing economy for its hill-leveling power. It is not "coming" but HERE—a car of demonstrated Superiority and embodying a knowledge of Eight Cylinder construction which makers in our wake must learn by experience.

There's a King dealer in your locality. Write for his address and new Eight catalog.

Cheese Making in the Santa Clara Valley

Dr. Leroy Anderson Writes of the Dairying and Cheese Making Industry in the State's Greatest Prune and General Fruit Growing Center

FARMERS in Santa Clara produce something beside prunes even though the prune is what has made the county famous the world over. In dairy circles the county is known as a cheese producer of first quality. As to quantity Santa Clara ranks among the first five counties in California. These counties stand something like this: Monterey, Sacramento, Marin, Santa Clara, San Benito, with Santa Clara having an annual production of about one-half million pounds. A comparatively small section of the county is devoted to cheese making, and that is located to the east and south of Gilroy. A drive of ten miles on the main highway leading southeast leads one by many cheese factories, and near San Felipe brings one to the boundary between Santa Clara and San Benito Counties. Thus the cheese sections of the two counties join closely, and more than one cheesemaker in San Benito County has his name in the Gilroy postoffice in the adjoining county, this because of rural delivery.

Soil, Water, Feed

The soil is some of the most productive in the state and reminds one of the Sacramento river bottoms or even in small portions of the Eel river lands of Humboldt. Most of the dairy lands are a creek sediment well adapted to growing alfalfa and corn and having an abundant supply of underground water with a small lift. Many wells are 80 to 100 feet deep with the water standing at 10 to 14 feet from the surface. At least one ranch enjoys an artesian well 400 feet deep and a flow of 500 to 600 gallons per minute. It is a joy to see such a flow without any expense for pumping.

The mainstays for feed are alfalfa and corn. Silos are common and usually of the stave type. Much land is leased by dairymen who may or may not provide the improvements. One beautiful piece of alfalfa is on a 69-acre tract leased for ten years at eight dollars per acre.

The lease began in 1910, and even now similar lands rent for two to five dollars an acre more. The tenant seeded the tract to alfalfa and put in an irrigation plant with a 90-foot well at his own expense. Practically all the dairymen use surface pipe for distributing water since the

Stave Silo, 17x32½

land is rather too uneven to level for checking.

One dairyman growing alfalfa and corn carries the two on a more or less regular rotation. Each year a few acres of alfalfa are plowed up and planted to corn and kept in the latter crop for two years when alfalfa is again seeded. He states that his alfalfa does not stand as long as formerly. His original seedings lasted for ten to 12 years while now the life of the alfalfa is about half that. An abundance of stable manure is put on when corn is planted.

Cheese Factories, Private and Cooperative

The size of factories ranges from the private dairy of 50 cows to one making up 8,000 to 10,000 pounds of milk daily. The dairyman milking 50 cows declared it to be profitable to make the cheese in his own plant. He is leasing the property on which he is working, and all build-

ings were provided in addition to the artesian well mentioned above. He employs two men to care for the cows and make the cheese. Each man milks half the cows and one makes the cheese as his special work, while the other feeds the cows. The cheese maker receives a monthly wage of \$50 and the other man \$40, both in addition to board. The daily output of cheese is five "flats" or 100 to 110 pounds and is of the half cheddar variety.

Probably the largest factory in the district receives milk from fifteen patrons. The owner of the factory has a dairy of 95 milking cows. The amount of milk received on August 13 was 8500 pounds and the biggest day this season was 9200 pounds. This is enough for about 40 "flats" of the stirred curd variety. Two men are employed. The method of paying for milk is rather unique. Patrons are paid for each 100 pounds of milk ten times the price of cheese, less 15 cents to cover the cost of making. Thus with cheese at 14 cents the price per 100 pounds milk would be \$1.40 less 15 cents, or \$1.25 net.

At another factory having at present six patrons, the milk is paid for on the fat basis. A composite sample is taken of each day's supply and tested weekly. Patrons are paid once a month. From the month's receipts a charge of \$1.40 per 100 pounds of cheese is first deducted to cover cost of making. The remainder is then divided pro rata upon the basis of the amount of fat which each patron delivered, including the factory owner's dairy. The price paid for fat in the month of July was 29 cents. Although owned by an individual, the factory is thus operated on a cooperative basis.

The by-product in cheese making is whey. At the Gilroy factories each patron is entitled to his share proportioned upon the amount of milk delivered, and he takes it home to feed to pigs. If sweet it may also be fed to calves. The 50-cow dairyman mentioned above says he feeds

nothing else to his pigs except when finishing for market when he gives rolled barley. The pigs certainly looked well, including brood sows which when nursing a litter have nothing but whey. For these animals it is allowed to sour. For calves it is fed sweet, a portion being scalded in the morning to keep it sweet for evening feeding. It will be remembered that in making cheese the casein and fat are nearly all put into cheese, leaving the albumin and sugar in the whey. The average analysis of whey is: Water, 93 per cent, fat .35 per cent, casein and albumin .80 per cent, sugar 5.20 per cent, ash .65 per cent.

Varieties and Returns

A good deal is being written nowadays about the California cheesemaker making a cheese like the eastern cheddar. With the latter selling uniformly at 17 to 18 cents and California flats at 10 to 14, there seems to be some reason in the effort to change the California habit. Gilroy cheese men, however, do not look kindly upon any change in method for several reasons: (1) The low mark of 10 cents in May and June was struck because of an excess of production. The high mark in California cheese of 19 cents early in 1914, was because of small production. The high prices then caused the erection of new cheese factories and also caused several creameries to change from butter to cheese. Hence the overproduction which has followed and a corresponding low price. The same thing would happen if cheddar were made. (2) As one cheesemaker put it: "With my present method (half cheddar) I can get one pound of cheese from 9 to 9 1-2 pounds of milk, while with the full cheddar process it would take 10 to 10 1/2 pounds of cheese." Roughly, the returns from 100 pounds of milk would be 10 pounds of cheese for the cheddar as against 11 pounds by his present process. On the present market of 13 cents he receives a premium of one cent, or 14 cents. The comparison then on 100 pounds of milk is: California, 11 pounds at 14 cents, \$1.54; Cheddar, 10 pounds at 17 cents, \$1.70. He thinks the difference is not enough to warrant a change. (3) The California flat requires a less time in making. Usually it is in the press by noon. The cheddar requires two to three hours longer in making, which is a material advance in its cost. (4) Cheddar requires a much longer time

International Motor Trucks

TIME is such an important factor in the marketing of fruit and vegetables, that any reasonable device for saving time receives earnest consideration. Perhaps the principal reason why International Motor Trucks are so popular among fruit and vegetable growers is because they save so much time on the road.

Around the larger cities truck farmers buy International Motor Trucks because their produce is on the road from one to three hours less time and is, therefore, delivered in such good condition that it commands the best prices.

Add to this advantage the ability to see customers first, which an International Motor Truck gives, and add again the saving of time on the return trip, and you have three good business-getting, money-making reasons for buying an International Motor Truck.

There are also other good reasons which every fruit and vegetable grower should know and which it costs nothing to find out. Drop us a line and we'll send you complete information about our three motor truck models, "M" for 1,000-lb. loads, "E" for 1,500-lb. loads, and "F," the new International 2,000-lb. truck.

Exchange Report

Manager G. Harold Powell Presents Report for Work of the Year Ending September 1st.

THERE were shipped from California during the year ending August 31, 1915, 40,991 cars of oranges and 6667 cars of lemons, making a total of 47,658 cars. The exchange shippers forwarded 24,217 cars of oranges and 5565 cars of lemons, consisting of 9,640,977 boxes of oranges and 2,244,617 boxes of lemons. The returns f. o. b. California, estimating the few cars unsold, will be about \$19,537,850; the delivered value in the markets is approximately \$30,000,000.

The Proportion of the Exchange Shipments

The exchange shipped 62½ per cent of the total shipments, representing the largest volume as well as the largest proportion of the total crop ever handled. There has been a gradual increase in the proportion of the total shipments handled by the exchange since its organization. Ten years ago our growers forwarded 47 per cent, five years ago 59 per cent, and three years ago 60 per cent of the total crop.

Cost of Exchange Service

Our shippers paid approximately four and one-fourth cents per packed box to distribute and sell the crop to 2500 jobbers in the United States, Canada and other foreign countries, or one and two-thirds per cent of the delivered value of the fruit. They paid approximately two cents per box or less than eight-tenths of one per cent additional for national advertising to increase the consumption of citrus fruits, to popularize the Sunkist brand, and to bring the shippers into closer working relations with the jobbers and retail dealers. In passing it may be interesting to note that national advertisers of food products often expend 10 per cent or more of the value of the product for advertising purposes. The total cost of distribution, marketing, advertising, and dealer-promotion work, including the general service furnished the shippers by the central office, averaged six and one-fourth cents per box or 2-46/100 per cent of the delivered value of the fruit. The average cost of the district exchange is 91/100 of 1 cent per box, making the total average cost of the exchange and district exchange service, including the cost of advertising, 7-16/100 cents per box. The exchange service which is an evolution of 20 years of experience is not only less expensive, it is more comprehensive than any other crop-marketing service yet developed.

Central Office

The exchange service embraces the central office, including the salaries of an average of 55 employees, the general manager, assistant general manager, sales agents, attorneys, traffic manager, field manager, cashier, and the assistants and clerical help. The services of these employees cost our shippers approximately 69/100 of one cent per box. The rental of the general offices, the Citrus Protective League, and all other administrative and general expenses of the central office cost approximately 48/100 of one cent per box, or a total cost of 1-17/100 cents per box for salaries, rental and all other expenses of the central office.

Selling Agencies

There are 77 agencies in the principal

markets of the United States and Canada, which represent the exchange growers exclusively in selling their products to the fruit jobbers and in developing new customers and new markets. The cost of these agencies, including 180 agents, assistants and brokers, the rental of the offices and all other district agency expenses is approximately 2 41-100 cents per box. The balance of the operating expense, amounting to 67-100 of 1 cent per box, represents the cost of the daily telegraph, telephone and other market-news service, and other incidental expenses.

Eight to One Standard

The exchange provided at the beginning of the year that all oranges shipped under the Sunkist or other advertised brands should contain not less than eight parts of soluble solids to one part of acid in the juice. It supported the United States department of agriculture, which promulgated the standard, in giving the consumer good eating oranges at the beginning of the Washington Navel season. Unrestricted competition for the early market had resulted in the shipment of green, immature oranges in November and early in December. A few carloads of fruit brought high prices, but consumers turned away from our oranges to other fruits or oranges more appetizing. Practically all shippers in Tulare County, and in the other early districts, agreed voluntarily not to ship oranges that were below the 8 to 1 standard, and organized to enforce the regulation. No act in recent years has done more to popularize the California orange than the shipment of fruit at the beginning of the season that is acceptable to the

trade and to the consumer. The early fruit shipped from the North was fine in color and good to eat. The trade pushed the sales with confidence. The consumer was pleased with the quality and there was a strong demand for Sunkist oranges. The shippers of the North deserve credit for the voluntary enforcement of this regulation. Those who knowingly ship oranges below the governmental standard and that are objectionable to the consumer should be severely condemned by the industry because of its adverse effect upon the interests of the grower.

Volume of Oranges and Grape Fruit in 1914-15

There was an increase of 19.1 per cent over the largest preceding season in the total volume of oranges and grape fruit shipped from December to February, inclusive, in 1914-15, from Florida and California, the average shipments from the two states equaling approximately 275 carloads per day during this period. This increase, in addition to 2,000 carloads from Louisiana and Porto Rico, had to be consumed in the face of the most disastrous business depression that affected both the American consumer and producer. It also had to compete with the largest crop of American and Canadian apples ever produced which sold throughout the winter at disastrously low prices.

Extreme cold weather prevailed early in December, which froze much of the fruit in transit and paralyzed the holiday trade. It gave the consumer inferior eating oranges soon after the season had opened so auspiciously and turned him to other fruits during one of the most desirable periods of the year. A similar severe cold period occurred in January, which still further interfered with the sale of fruit and damaged a large number of cars in transit.

The table following shows the number of carloads of oranges and grapefruit shipped from Florida and the oranges shipped from California from December, 1914, to August, 1915, inclusive:

Florida and California Shipments, 1914-15			
	Florida	California	Total
December	5170	4668	9838
January	3538	3197	6735
February	4157	4753	8910
March	3709	5852	9561
April	2656	6556	9212
May	1229	5666	6895
June	241	3097	3338
July	6	1362	1366
August		850	850

There was an increase of 33.8 per cent in the volume shipped in December, 1914, as compared with December, 1913, and an increase of 27.4 per cent in February as compared with February, 1914. This increase in volume, with the low retail prices that prevailed, increased the per capita consumption and affected the prices received during the latter part of the season.

Decay in California Oranges

The decay in California oranges, which was abnormally severe in February and March, cost the growers in some districts more than one-half the cost of producing every box shipped during the month of February, and the state from \$15,000 to \$50,000 per week. The decay was equally disastrous to the jobbers and retailers and for this reason many of them ceased handling California citrus fruits altogether. The large increase in the crop from Florida and California, the abnormally large apple crop, the damage to the fruit in transit in December and January, the excessive decay in

February and March, coupled with the universal depression in business resulted in low prices. This condition was common to practically all perishable fruits and vegetables, as a result of the chaos in international trade, all of the citrus-fruit producing countries of the world having been adversely affected. Private benefactions have been necessary in some countries, to keep the grower from starvation.

Effect of Publicity

In March, under better climatic conditions, the decay disappeared and market began to improve. This improvement was accelerated by the national publicity given Orange Day, March 20th. Orange Day was recognized by the Governor of California and by many of its leading institutions. It was given a national publicity at that time by publishers, railroads, express companies and other organizations. Through the cooperation of the Exchange with the publishers and with the trade, more than 250 pages of orange advertising ap-

peared in the newspapers on Orange Day. It was "bargain day" in oranges, supplies that had accumulated were cleared up and the markets thereafter readily absorbed the fresher, newer stocks. Comparatively satisfactory prices were received in April and May, and 26 per cent more oranges and grapefruit were consumed in April than in 1914. The almost universally low margins of the jobbers and retailers during the winter and spring months gave the consumer Navel oranges at reasonable prices and formed a greater orange eating habit than the people have ever acquired before. The better condition of the later market brought the average on all Navel oranges higher than the average of the previous year.

The Valencia Market

The effect of national advertising, coupled with a somewhat smaller crop than in 1914, has been a leading factor in making one of the most satisfactory Valencia seasons in recent years. Through national advertising

the Exchange is popularizing the Valencia with the American consumer. Investigation showed that the Eastern consumer believed that the Valencia is a winter orange taken out of cold storage. Few knew that California produced a summer orange of luscious eating quality. Through national advertising the consumer is realizing the healthful qualities of the California orange, the demand of the consumer for the Sunkist Valencia orange is increasing everywhere.

The trade has learned that the Valencia is comparatively free from decay; that it is the only summer fruit that can be handled without excessive loss; that it can be shipped into the country towns and to the mountains and seaside resorts. The good color and eating quality of the Valencia, and the freedom from decay, have combined to give the growers of the Sunkist Valencias a splendid financial return.

These Goodyear Tires Made Extra-Large

Sizes 30x3 1/2 and 30x3

We are this year giving special attention to users of small-size tires. There are about a million of them. And the tire we build would win them all if all of them could know about it.

\$317,000 Added

This year we are building these tires larger than ever. We've increased the air capacity by 20 per cent. Added size means added mileage, as every user knows.

We have added 30 per cent to the rubber in the side walls just above the bead. That's where constant bending taxes tire walls most. And where thin-walled tires often chafe and break.

We have made new molds to improve the tire's design. For we have found a new shape which increases endurance.

These three additions will add to our tire cost \$317,000 this year. Yet this year we made another big price reduction—our third in two years, totaling 45 per cent.

Four-Ply Tires

Even the smallest Goodyear Automobile Tires

are four-ply tires—even size 30x3. And our anti-skid tread—the Goodyear All-Weather—is double-thick on all.

So Goodyears have always been exceptional tires. They won on sheer merit the top place in Tiredom, and for years have outsold any other.

Now we add 20 per cent to the air capacity and 30 per cent to the rubber above the bead. And we give you a better design. We are building by far the most capable tires ever built in these small sizes.

So even the occasional mishap and misuse will find new strength to combat them.

Get These Extras

The value we give in Goodyear tires is due to our mammoth output. Get that value—it is due you. Smaller, thinner, lighter tires can't serve as Goodyears do. Even last year's Goodyears, though the leading tires, could not compare with these.

Any Goodyear dealer will supply you. Every neighborhood has a Goodyear Service Station with your size in stock, and it renders full Goodyear Service.

THE PRUNE SITUATION

SANTA CLARA COUNTY'S prune growers' committee of which J. H. Bone is chairman and H. O. H. Shelly, secretary, met in the chamber of commerce in San Jose, Saturday, August 28, to collate statistics as to the 1915 prune crop. Regarding the report the San Jose Mercury says:

Some 25 orchardmen, representing practically every portion of Santa Clara County, were in attendance. Written reports were received from F. C. Wilson of Sunnyvale; Fred Millard, Valley View; D. M. Utter, Union; H. A. Clark, Saratoga, and Emil Neilson, Doyle. Aside from these there were a number of telephone reports from points in Santa Clara County and from other counties in the prune growing district.

It can be conservatively estimated that an actual report of more than 80 per cent of present actual conditions are at hand.

After a careful tabulation of the reports from every section of the prune growing belt the meeting prepared and gave out for publication and distribution:

"Since the prune harvest commenced the feeling has been growing that the crop is falling far short of what it was estimated at the time of the mass meeting in May. At Saturday, August 28, 1915, meeting a full report was made by from 18 to 20 different growers from all parts of Santa Clara County. Only three of these reports estimated the 1915 crops to be as large a crop as was estimated early in the season. One-half of the reports stated that the crop would be 25 per cent less than previous estimates, other reports putting this year's shortage from 10 to 20 per cent.

"A careful personal canvass by a member from one of the best districts gave the following figures: "Of 30 growers interviewed, having 804 acres of prunes, the 1914 crop was 1702 green tons. The early estimate of the 1915 crop was 2038 green tons. The present outlook is for 1755 green tons, a shortage of 14 per cent from early estimates.

"At present packers are offering a 4-cent basis or better for 'first picking' prunes as they come from the trays, but are having very little success in obtaining any quantity at these figures.

"The growers as a whole are standing firm on the idea that the 5-cent base is the least price at which any general sale should be made.

"As all growers are aware, the first picking is the poorest quality of the season, and, as one of the largest growers in the valley remarked to a committee member, 'If the packers pay 4 cents for such stuff, this is equivalent to the good fruit being at a 5-cent base.'

"This low grade stuff that the packers are now buying is going out to fill the spot market for immediate use and by no manner of means sets a market price for the main crop or in any way lessens the probability of the main crop reaching a 5-cent base to the grower who has backbone enough

to demand and hold for 5 cents in the face of the evident shortage.

"Direct reports from Sonoma, Napa, Contra Costa and Tulare Counties indicate that these districts are falling far short of packers' estimates and that a large proportion of the growers are holding, as we are, for the 5-cent base.

"The situation now appears to be so far in the hands of the growers that it only remains for them to remember similar previous occasions on which their fruit has been sold by the packers while in blossom on the basis of an enormous crop prospect, and when harvest came and the tonnage shrank the price rose in proportion.

"We again call attention of the growers to the way in which the price of dried apricots rose after harvest. This in spite of packers stating that it would be practically impossible to sell them at all.

"Also we call attention to the fact that no matter how great the shortage no buyer will raise his offer to the growers unless the spirit of the growers is such as demands and necessitates it."

GRAPE OUTLOOK

The state board of viticultural commissioners is sending out Bulletin No. 5 with a review of conditions in various counties. It appears that the crop will run about 60 to 70 per cent of normal. A few counties will run lower than this. For instance Yolo is referred to as having a very poor crop, mildew is noticed; Sacramento, half of crop, Sonoma not to exceed half of normal, Santa Clara, San Joaquin and others about 60 per cent; Napa County 80 to 85 per cent; Contra Costa County 75, Mendocino, Los Angeles, San Bernardino, Stanislaus and others 75 to 80 per cent.

We quote in full the report regarding vineyard conditions in Fresno County:

"It is said by many that in the last 20 years the vineyards in the San Joaquin Valley have never looked better than this year. If weather conditions the rest of the season are favorable the raisin crop will be considerably more than the average, especially the Muscat variety. Thompson Seedless and Sultanas will not exceed last year's production to any great extent. The raisin interests are fearful lest the growers may not exercise necessary care in the selection of the pack. A big percentage of the raisin-grape crop always goes to the wineries, but this year the sweet-wine wineries are so pressed by the exorbitant federal tax that they are not able to handle culls and second-crop grapes because of the tax money involved in their manufacture into brandy for fortification of sweet wine. The tax this year is 18 times greater than it has ever been and the failure of the wineries to handle the culls will necessarily prompt the grower to dry grapes that are not fit for the market as standard raisins. To pursue this practice might demoralize the raisin market and growers and packers should be cautious. It would be preferable to submit to entire loss of the second-crop grapes and culls than to spoil a season's pack by using a percentage of inferior fruit. The same advice would

apply to the shippers of table grapes who are also hampered in the disposition of their second-crop grapes by the federal tax on fortifying brandy.

"Some of the varieties of wine grapes are short by from 25 to 50 per cent, but other varieties show a good crop. The Malaga crop is short but as a whole the grape production in the San Joaquin Valley in the southern section will be larger than the average. The late and continued rains that came the first four months of the year without excessive hot weather, caused a development above the average in the southern section, while it caused a shortage in the northern districts by the rapid development of mildew and faulty setting of the fruit at blooming time.

"From another source in Fresno County the opinion is ventured that the Muscat grape will yield an average crop as will also the Thompsons, Sultanas and possibly Zinfandels. Feher Szagos will yield about 60 per cent,

RED SPIDER TROUBLES

Written for the California Cultivator
By Sacramento Valley Contributor

Red spider is causing a great deal of damage again this year on prunes, almonds and other trees and is a serious pest in some nurseries.

It is being combated with sulphur in various forms, principally atomic sulphur as a spray; flowers of sulphur and flour paste as a spray; and fine sulphur dusted on the trees either through a coarse grain sack or with a power blower.

When an orchard infested with red spider is neglected it soon makes a very sorry showing, and there are many young and old orchards in the Sacramento Valley that now have almost no leaves, the growth for the season is stopped and they are very liable to sunburn.

Red spiders are thick not only on the trees in some orchards but on the alfalfa that is planted between the

RICE FIELDS OF LUZON, PHILIPPINE ISLANDS

A subscriber, Mr. Artemas R. Kratz of Bangued, Philippine Islands, sends us this photo showing methods of rice cultivation in Northern Luzon. Rice culture in California is attracting much interest but we doubt not it will be many years before intensive cultivation will necessitate its culture in terraces up on the hillsides as has been done in the Philippines.

and other wine grapes about 80 per cent of a normal crop. Feher Szagos suffered from climatic conditions during the blooming season and other wine grapes have suffered somewhat from a hot spell in July."

The viticultural commission expects to issue these reports some three or four times during the season.

Regarding the shipping of fresh grapes in sawdust the board says: "Table grape growers of the state who may be contemplating putting up a portion of their pack in kegs with the use of redwood sawdust as a preservative may be interested in knowing that the cost of the package, the sawdust and the labor is about 90 cents per keg. Freight and refrigeration to Chicago amounts to 71 cents per keg. Last year some of the grapes packed in this form sold as high as \$2.50 per keg F. O. B. California. This price, however, was subject to considerable fluctuation and where the grapes were consigned they brought various prices according to their condition when the keg was opened.

"The keg contains about 35 pounds of grapes, and the mode of distribution has been largely through commission merchants and the agencies established in the East by the large fruit shipping concerns of California. Although a great quantity of table grapes was packed in this fashion last year, the distribution by this means may still be considered to be in an experimental stage.

rows, corn planted in the same way, on roadside weeds, and on the oaks, willows and native shrubs in the areas around the orchards.

In order to keep the spiders in check it is necessary this year to keep everlastingly at the spraying job; they seem to multiply over night, almost, and as soon as the spraying is completed on a block it has been necessary in some cases to double right back and do it over again.

A thorough spraying with a good oil spray in the winter is to be tried in some orchards in an effort to kill many of the over-wintering eggs.

APPLE PRICES IN THE NORTHWEST

The sales manager of the Spokane Fruit Growers' Company, a member of the Northwest Shippers' League, reports the following as the opening prices of apples:

Jonathan, fancy, \$1.05; extra fancy, \$1.25; Grimes Golden, 95c@1.15; Stayman Winesaps, \$1.00@1.15; Spitzenburgs, \$1.50@1.85; Delicious, \$1.25@1.75; Winter Bananas, \$1.50@2.00; Arkansas Blacks, \$1.50@1.75; Rome Beauties, \$1.20@1.35; Black Den Davis, \$1.00@1.25; Ganos, \$1.00@1.20; Wageneers, \$1.00@1.25; Black Twigs, \$1.00@1.15; Ben Davis, 95c@1.15; Winesaps, \$1.30@1.50.

These prices are under those of 1913 but much better than those of last year. The manager writes:

"In today's mail we received two requests for quotations, one dealer asking for prices on 70 cars of Spokane apples and the other on 150 cars. The buyers are optimistic, but they are also conservative. We are now drafting our opening prices and they are substantially the figures given."

"Creeping Grip" Tractor of General Utility

Tractors of moderate size are proving their great utility and giving good results to the grain rancher as well as to the bean and beet grower. The Bullock Creeping Grip Tractors, equivalent of six to eight horses on soft ground, are delivered to Southern California ranchers for \$1100.00, freight paid by Bullock.

How would you like a Tractor that will do your plowing with 3 14-inch bottom plows, operating on cheap fuel, No. 1 distillate, consuming one and one-half gallons per hour and during that hour plow one acre? This performance may be a gauge to you of other work that may be performed with this Bullock Creeping Grip Tractor that sells for \$1100.00.

The purchase of this moderate size Tractor will prove a profitable investment. The first cost is less than the equivalent power in horses; the operating expense is far less than the horse equivalent and no expense is entailed while idle.

The "Creeping Grip" has that oscillating feature combined with a perfect balance that enables it to traverse rough, uneven ground, and at all times maintain its grip. The traction is perfect, there is no slippage.

On exhibition in Los Angeles.

Farm Bureaus

THE wonderful agricultural resources in northern Arizona are much less developed than those of southern Arizona. The University of Arizona agricultural extension service is maturing plans whereby the farmers of northern Arizona will receive better service than ever before. Prof. Stanley F. Morse will make an extended trip through Yavapai, Coconino, Navajo and Apache Counties, according to the following schedule. In Navajo and Apache Counties he will endeavor to raise funds for putting in a farm adviser. Funds for this purpose have already been allotted by the United States department of agriculture, the University of Arizona and the Santa Fe Railroad Company, but the counties must appropriate at least 30 per cent of the total funds before a farm adviser will be stationed there. Prof. Morse's work in Yavapai and Coconino Counties will be to assist the farmers in organizing local associations for social, educational and commercial purposes. There are now 36 local farmers' organizations in Arizona.

Prof. G. W. Barnes will accompany Prof. Morse from Holbrook to Flagstaff to assist the farmers with their livestock problems. Prof. Barnes will select certain farmers as cooperating farm demonstrators to carry on demonstrations of profitable methods of handling range bulls, hogs and sheep under his personal direction. The balance of his schedule will be made public at an early date.

A convention of representatives of the farmers of Cochise and Santa Cruz Counties met at Douglas August 27 and 28 and organized the Cochise-Santa Cruz County Farm Improvement Association. The next meeting of the association to perfect its organization by adopting a constitution and by-laws and electing permanent officers will be held at Cochise on Saturday, September 18, at 3:30 p. m.

Saturday, August 28, was devoted to a motorcade on which the farmers visited eight ranches within about 30 miles of Douglas belonging to Dr. A. W. Vanneman, Mrs. W. Hatche, Applewhite Investment Co., Messrs. Shepard, Smith, Patterson, Schultz and Kuntz. Three pit silos, several concrete caisson wells, two boys' corn club plats, and several orchards and gardens were inspected. The valuable feature of the ranches visited were pointed out by the four farming experts who accompanied the party. Several of the visiting farmers said that they were going to construct pit silos in the near future, and all were interested in seeing some Sacaton June corn grown from pedigreed seed distributed by the University of Arizona agricultural extension service.

Maricopa County, Arizona, J. A. Armstrong, Adviser, Phoenix

Land outside the Roosevelt Dam project which has been receiving water on a rental basis may still secure this service up to sometime in December. To the man who is on the job this is long enough to enable him to make another crop. Land that is deeply plowed and irrigated with 12 to 20 inches of water and harrowed from time to time will carry a crop of wheat or barley through any amount of dry weather and make a satisfactory crop.

Chandler Farmers' Union has passed resolutions asking that a local

ON THE MARINA AT THE EXPOSITION JUST BEFORE THE ASCENT OF THE AVIATOR

LIVE STOCK AT THE PANAMA-PACIFIC INTERNATIONAL EXPOSITION

Editorial Correspondence

ALMOST, if not quite all, healthy, normal people are interested in live stock. Many may not know very much about it from a strictly technical viewpoint, but they like to see good animals.

This is shown by the attendance at the live stock division of the Panama-Pacific International Exposition this summer.

To have a continuous show of live stock for several months is a big undertaking. The competitive shows of the breeds are for two week periods during the fall, that is, a two weeks horse show, followed by a two weeks cattle show and later a two weeks hog and sheep show.

Breeders generally cannot afford to keep herds on exhibition for a longer period at one show because of the expense, the inadvisability of keeping breeding animals in show form for a longer period, etc.

In order to have a show that would be an education to visitors at the fair during the entire year, and that the various breeds might have the benefit of the advertising, D. O. Lively, chief of the live stock division of the exposition, planned to permit the breed associations to maintain herds of representative animals on exhibition continuously.

This was a great opportunity but it was taken advantage of by but a few organizations and some progressive breeders, so that while not as complete as it should be, there are many splendid individuals in the "all year" show, and thousands of visitors visit the barns.

The Carnation Stock Farms of Seattle, Washington, and Oconomowoc, Wisconsin, have had a herd of splendid Holstein cows on exhibition in one of the dairy barns. These are kept, cared for and fed in the most approved manner and milked with a calf way milking machine. This is a very interesting operation to many dairymen and to hundreds of city people.

In August a splendid herd of very high class Guernsey cattle was put on exhibition by W. H. Dupee, of Santee, making a show that will do the Guernsey breed a great deal of good on the coast.

There are many splendid animals in the horse barns, and Easton & Ward have a wonderful show of sires from the Blackhawk Stock Farm at Burlingame. The California bred horses they are showing demonstrate the fact that no better Shires can be produced anywhere than here.

H. Thornberry of Stockton shows a number of gaited saddle horses; and the Hopland Stock Farm, Hopland, a band of splendid Hungarian ponies.

Mrs. Anita Baldwin has a sensation-

al display of Percheron and Arabian horses from her stock farm at Santa Anita, and Durham & McLaughlin of Oakland are showing a number of good Percheron stallions.

The American Berkshire Swine Breeders' Association of Springfield, Illinois, has shown itself to be the most progressive breed organization in the country as far as this view herd proposition is concerned. It is the one breeders' association that has maintained a show during the entire fair. A good lot of hogs have been on display continuously and the herd has been in charge of a representative of the association who has explained the merits of this excellent breed to thousands of interested visitors. Many sales of hogs have been made and the Berkshire Breeders' Association has received benefits many times greater than the cost of this display.

Had it not been for the quarantine in connection with the foot and mouth disease situation in the East other breed associations would undoubtedly have maintained display herds, but in view of the fact that good representatives of almost all of the breeds could have been secured on the coast makes this rather a poor excuse.

During August a show of Shorthorns was made by the American Shorthorn Breeders' Association.

The decorations in the horse barns are the most elaborate ever seen at a fair or stock show. Over \$2000 was spent in decorating one barn. In addition to painting, bunting, lattice work, etc., a great many beautiful potted plants and trees have been used.

There is a good show of poultry that is of great benefit to that industry on the coast.

And it is very fitting that in connection with a California live stock show there should be a number of silos on exhibit. There are stave silos shown by three different firms, one reinforced concrete silo and one metal silo.

While there is much to interest the lover of live stock at the fair now, plans should be made to attend the big stock shows during October and November.

SWINE BREEDERS

Secretary Thompson of the California Swine Breeders' Association is writing to members asking as to the advisability of a banquet and reception to be held in connection with the meeting of the National Swine Growers' Association, which meets in San Francisco November 4. The meeting will be held in connection with the swine exhibit at the exposition. Secretary Thompson is also asking as to the advisability of the California Swine Breeders' Association supervising a consignment auction sale and wishes all the members to write him as to their ideas and how many hogs will be furnished if such sale is pulled off.

This is a great month for conventions and congresses. There are to be 82 international and state congresses.

GOOD ROADS

The entire week of September 13-18 will be required to give proper discussion of good roads by the Good Roads Congress. There will be delegates from all sections of the United States and even other countries of both North and South America.

The Eucalyptus Hardwood Association of California is in session this week.

Friday, September 10, is El Dorado County day.

Saturday of this week is Butte County Day.

Monday, September 13, will be Tri-State Good Roads Association Day, also San Luis Obispo Day.

Thursday, September 16, is Farmers' Day, also Pacific Highway Day.

All exhibition palaces are open until 6 o'clock.

IRRIGATION CONGRESS

Of greatest interest to Pacific Coast people for next week will be the International Irrigation Congress, which will require seven days of discussion. This great organization has accomplished much for semi-arid America. There will be delegates from many foreign countries.

Books

This list is prepared with the purpose of enabling our Cultivator readers to supply themselves with standard books at lowest possible prices. We call especial attention to a few of the new publications. "Citrus Fruits" by Professor Coit, of the University of California, covers all phases of the Citrus Industry under California conditions—the kind of a book we have had many calls for but never before been able to supply. "Productive Feeding of Farm Animals" by Woll, will command special attention. "Poultry for Profit" (The Cultivator Poultry Book) by Koethen, another California book, is new and excellent, telling what to do and what not to do with poultry in California; a sure guide to poultry success. The new Standard Encyclopedia of Horticulture, by Bailey, is not equalled by anything of the kind which has ever been published at any time in any language. Special terms of payment and discounts are offered by the publishers through us on this Encyclopedia. Write us about it.

General Agriculture

DRILL CLOSELY

AS our grain been drilled too far apart to secure fullest returns from the land? Some have decided so and to that end a drill has been constructed with a three and one-half inch interval, leaving with its spread of seed less than three inches between the drills. This is practically broadcasting excepting it gives much better and more uniform covering of seed. We were given the name of one of Oregon's most successful farmers, Mr. C. D. Nairn, of Yamhill County, and from him we have a letter from which we take this data:

"Regarding the three and one-half inch drill will say it is a pleasure for me to write regarding this method

and I have secured better results with this broadcasting than with the old type of single drill. We have taken particular pains in the growing of oats from selected heads chosen from the choicest of large fields. Prior to securing this improved drill we have done this special work by opening a furrow with the hoe and seeding with the fingers. I consider this type of drill practically the same as broadcasting only that much better results are secured. When drilled in in this way harrowing is not necessary although a very light harrowing may possibly be beneficial.

"Our best yield was on clover sod plowed in early spring. The seedbed was prepared by clod mashing, followed by disking and springtooth har-

ADVANTAGE OF CLOSE DRILLING

Corner of a 50-acre field of Shadeland Eclipse oats on Shadeland Farms, and C. D. Nairn, owner. This grain was drilled very closely, leaving no chance for wild oats or other weeds. Yield 92½ bushels per acre.

which has so much real merit for I know it will be a benefit to many a farmer. This furrow drill is a great success. The first field of oats seeded with it yielded 92½ bushels per acre, nearly double that of any other field in our neighborhood. The stand of oats was so thick there was no possible chance for wild oats or other weeds to grow and the land was perfectly clear and free for the fall seeding of wheat. In addition, the oats so fully shaded the ground and protected the roots from the heat of the sun that much moisture was saved. On our ranch we are largely engaged in the growing of seed oats and we find that seed houses demand them not only true to name but free from wild oats or other weed seeds and this crop of seed oats just harvested, which was drilled in with this improved drill, is the finest seed we ever produced in our 30 years of experience in seed growing. Our oat-fields have been visited during the past season by many leading farmers and seed men who are watching results. Most of them are convinced as to the worth of the drill, both because of the increase in yield and the resulting pure seed. Many farmers in this section will seed oats with drills which will permit this satisfactory work. I have been an expert in seeding by hand, sowing with both hands and often seeding 40 acres per day and usually getting good crops,

rowed the reverse way, drag harrowed, then rolled, followed with the three and one-half inch disk shoe drill. From April 9 till the end of May I never saw oats grow so fast, even keeping pace with those seeded by hand in the trial plots and were harvested 10 days earlier than oats seeded by hand or with a disk drill. By way of testing I sowed a strip by hand and another by drilling in same field as those planted by the three and one-half inch drill and the results were most startling. I am safe in stating those seeded by the three and one-half inch drill yielded 50 per cent over any of the other methods stated and we are optimistic over this method of planting our fall wheat as our spring oat seeding has proved a great success."

POTATO MEN GROW CERTIFIED STOCK

"One hundred and sixty Wisconsin potato growers have made application to have their fields inspected, with a view to marketing their crops as certified seed," said J. G. Milward of the College of Agriculture of the State University. All potato sections of the state are represented in the 160 applications, a large number of which have come in as a result of the certified seed potatoes sold last year. At that time certificates were issued to 48 potato growers. A large number of these men advertised

their stock and sold their crops as certified seed at advanced prices. Other farmers, buying this seed, have been stimulated to also strive for high quality, and to put a certified product on the market.

SIXTH POTATO CONFERENCE

Sebastopol asks for a potato conference September 25. Two of Sonoma County's potato growers have entered the prize contest for the best acre of potatoes, and one of these elects to grow certified seed potatoes under the law passed by the last legislature at its late session.

The complete circuit of conferences with dates is as follows: Bakersfield, September 14; El Monte, September 16; Nuevo, near Perris, Riverside County, September 17; Salinas, September 20; Stockton, September 23; Sebastopol, September 25. There will be two sessions at each place, one at 10 a. m., the other at 2 p. m.

Addresses will be given in each case by the county commissioner who will be asked to preside, and also by a local potato grower who will give the history of potato growing in the locality. Mr. W. V. Shear of the United States department of agriculture, and the state horticultural commissioner will also deliver addresses.—A. J. Cook, State Commissioner of Horticulture.

ENFORCING SQUIRREL CONTROL

Written for California Cultivator
By L. B. Stanton

By an act of the legislature passed in 1909 and found on page 311 of statutes of that session it is made and declared to be the duty of every one owning, leasing, occupying, possessing or having charge of any land, place, building, etc., which is infested with rats, mice, gophers or ground squirrels, as soon as the presence of same shall come to the knowledge of such person to at once proceed in good faith to destroy said rodents by poisoning, trapping or other means.

The state board of health should require health officers, and inspectors acting under said boards are given authority, to enter upon any and all lands to ascertain if the same are infested with rodents and if the parties holding such property are proceeding to exterminate the same. The board of supervisors in each county and the city council of every city and county whenever by resolution it determines that it is necessary to prevent great and irreparable damage to crops or other property may purchase poison and traps for the destruction of such rodents; has power to employ inspectors to exterminate the rodents under the direction of the health board on both public and private property; if any person fails or refuses to exterminate the rodents the said health officers may at once proceed to destroy the squirrels, the expenses being made a charge against the county, and upon such expenses being incurred the county is entitled to a lien against the property on which the rodents have been destroyed for the cost thereof.

While by the above act it is expressly made the duty of everyone having squirrels upon their places to immediately destroy the same, the only penalty or remedy provided is through action of the board of supervisors or city council, which may order the health officers to enter upon the property and exterminate the same. The most practicable way, therefore, for any of the individuals in any section to obtain results under this act would be to petition the board

of supervisors of the county, in case their residences are outside any incorporated city, to order the health officers to enforce their duties as above stated, and it would be particularly advisable for the people in any particular section of the county to take the matter up very strongly with the supervisor elected from that district. If the matter is thus strongly taken up there is no doubt but that results can be obtained.

ERADICATING THE SQUIRREL

It appears that the squirrel pest is increasing rather than decreasing under the campaign or lack of campaign which has been continued for the past few years. The state law is explicit in the matter but county supervisors have found it unsatisfactory to attempt to eradicate this pest. It appeals to us that the matter could well be referred to the county horticultural commissioner with instructions on the part of the board of supervisors to take up the enforcement of the law which relates to the squirrel pest. It is probable this pest destroys thousands if not millions of dollars' worth of property in this state every year. We have been endeavoring to learn as to method of handling the pest in other counties. Mr. Collins, county horticultural commissioner of Tulare County, writes as to the methods in that county.

The horticultural commissioner here has nothing to do with the control of the squirrel pest. There is a state law governing this which I think places the matter entirely in the hands of the supervisors. A few years ago they appointed inspectors for this work here and conducted a campaign for a couple of years with almost no results as the law was not enforced as it should have been. In Sutter County the supervisors placed the matter in the hands of County Commissioner Stabler, but this is the only county I know of in which the commissioner has anything to do with the matter. The squirrel pest is a very expensive one in this county, and there is so much complaint that our board of supervisors has recently fixed a bounty of three cents, which will, I believe, accomplish more than was done in the endeavor to enforce the law.

Perhaps the bounty proposition might be a satisfactory way of handling the pest. However, handled as the federal government experts do by smothering the pest in their holes, intelligent work on the part of some agent of the county should be able to effect eradication much more quickly than can be done by a system of poisoning or trapping.

BARLEY LIMED TO CONCEAL SMUT

An investigation by the department of agriculture has revealed a practice on the part of certain dealers in California of purchasing smutty barley, treating it with lime and, after mixing it with clean barley free from smut, selling the mixture as choice brewing barley. The lime conceals the smut so that it cannot be readily detected by the eye, and after the limed smutty barley is mixed with clean barley, grain inspectors cannot detect the smut. In consequence they pass the mixture as choice brewing barley. The addition of the lime to the smutty barley does not remove all the smut but merely conceals it. A chemical analysis, however, easily detects the addition of the lime and the presence of the smut. The smutty barley is purchased from the farmers at a low price, but after being limed and mixed with clean barley is sold at the price of choice brewing barley. As the addition of the lime costs little there is considerable profit in this fraudulent practice.

This practice of liming smutty barley and afterwards mixing it with clean barley conceals inferiority and therefore constitutes an adulteration under the food and drugs act.

Grand Prizes

The International Jury of Awards of the Panama-Pacific International Exposition has awarded Grand Prizes for the Caterpillar Tractor and the Caterpillar Harvester. Only one Grand Prize is awarded in each class—the rating is made on the skill in invention, on the value to the world and to agriculture, and on similar points.

Send for Bulletin B 309, which gives full information about the Caterpillar Tractor, or ask for literature on our harvester line.

geles, California, as Second-Class Matter.**Thursday, Sept. 9, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**DON'T YOU LIKE US BETTER?**

We doubt not many readers of the
Cultivator may recall the days of new
boots with red tops and copper toes
and the justifiable pride taken in call-
ing attention to them. Not otherwise
is the youngster of today with his
coaster or toy auto. So we trust the
Cultivator may be pardoned if it ex-
hibits a bit of the same pride and re-
fers to its new dress or rather the ma-
terial in it. For some time plans have
been making for beginning the new
year with a better paper than has been
used, but if a better paper is good for
the new year it is good for finishing
the old, so instead of waiting, the bus-
iness management has deemed it wise
to begin at once, and by another issue
all the paper will be on a calen-
dared book paper much more pleas-
ing than that formerly used. Clothes
are not the making of the man, but
they are a material help, for the well
dressed man with his chest forward is
more able to compel respect—and
often success—than one careless of his
attire. The Cultivator has always en-
deavored to be neat in its general ap-
pearance and now will increase this
endeavor for the more attractive paper
will enable it to make a better show-
ing of its contents, and we assure our
readers that during the new year
which is approaching we will endeavor
to make the contents of the paper bet-
ter than ever.

We invite our subscribers to join in
the effort to make this paper more of
a power by passing the good word
along to their neighbors. The greater
our family the greater will be the ef-
fort and the greater the possibilities
of securing the very best for all. Espe-
cially do we ask our readers to make
suggestions as to their needs.

A GREAT CROP

There is some good reading in
the report made by Manager G. Harold
Powell of the California Fruit Growers'
Exchange to the directors and mem-
bers of that organization and quoted
in part in this week's issue of the Cul-
tivator.

It will be noted that the total ship-
ments from September 1, 1914 to Au-
gust 31, 1915 were 40,991 cars. Of this
the Exchange shipped 62½ per cent,
and for its shipments secured f. o. b.
California approximately \$19,537,850.
It is the greatest proportion and great-
est total of citrus fruit that has been
handled by the exchange.

This is an immense sum of money
to pass through the hands of one or-
ganization and is evidence of its worth
to the California fruit industry. That
its worth is being appreciated more
and more is shown by the statement
that ten years ago the exchange was
handling 47 per cent of the total out-
put of the state; five years ago, 59 per
cent; and three years ago 60 per cent.

more than \$25,000,000. With all our
being a great gold producer, all our
mines barely exceeded in value the cit-
rus fruit handled by this one organ-
ization.

START A PARK

Many years ago Pomona, a live
and interesting town on the eastern
rim of Los Angeles County, was with-
out a park. Some years before in lay-
ing out the town the land and water
company had devoted a little acre
and a half square to park uses but,
owing to certain complications and to
the fact that the city had never done
anything to improve the so-called
park, it was forfeited. Then the Po-
mona Land and Water Company of-
fered to the city a parcel of about 25
acres of "worthless swamp," or rather
ciénega, and cactus covered hillside.
This was to be a gift conditional on
the "city" (Pomona then was a town
of some 1200 or 1500 people) making
certain improvements. The opposition
to the acceptance of this property was

Agricultural Notes

Federal authorities are warning own-
ers of stock that foot and mouth dis-
ease is often carried by swine, as they
have proved very susceptible to it.

Two thousand five hundred boys
and girls are said to be enrolled in
the corn and potato growing and gar-
dening and canning clubs of Mon-
tana.

The problem of moving Canada's
great wheat crop is one of the most
serious problems which the govern-
ment has to consider. Efforts are be-
ing made to have some of the ships
now on war service released and
every available tramp steamer pressed
into service.

Prices on the onion seed crop of
the Canary Islands show a five per-
cent increase in the past month with
prospects for much greater increase.
So great is the demand for the seed,
not only in the United States but in
Argentina and Cuba, that most of the
seed is grown under contract.

The fight against citrus canker in
Florida is still a strenuous one. Re-
cently a number of growers in Dade
County secured an injunction restrain-
ing the state plant board from enter-
ing their orchards to burn infected
trees. The injunction has now been
overruled and the plant board sus-
tained in its action.

American butter is being imported
into Hong Kong to supply South
China. This trade is usually supplied
by Australia, but her resources have
been so seriously depleted by
drouth and the war drain that the
American goods have found entrance.
American cheese is already very pop-
ular in the Far East.

Chinese demand for ginseng root is
better now than since the unsettled
war conditions have prevailed. Cul-
tivated root has been selling at Hong
Kong at about \$2.90 to \$7.25 per pound.
Sales at that point during the first six
months of the year have amounted to
about 40,000 pounds. The stock on
hand on July 1, 1915 was around about
36,000 pounds, as compared with about
40,000 pounds on January 1 and 70,000
pounds at the same date last year.

The orange and mandarin crops on
the Paterson River, in New South
Wales, Australia, this season were
heavy. The fruit has a large domestic
demand throughout the country dis-
tricts. Exports of citrus fruit for 1913
from New South Wales amounted to
2,352,600 pounds, valued at \$81,480, of
which 2,308,600 pounds, valued at
\$79,027 was Australian produce. The
opening of the Panama Canal it is
hoped will produce a market in the
United States for Australian citrus
fruit.

In a new monograph on European
commercial law issued by the United
States bureau of foreign and domestic
commerce is this interesting state-
ment: It is not generally known in
America that in Germany such ex-
pressions in advertisements as "best
and cheapest place to buy" "sold at
factory prices," etc., are inadmissible
unless true; that actions have been
sustained against merchants who dis-
played signs of "English spoken here"
when the assertion was not in accord-
ance with fact; that it is unlawful to
attempt to entice away prospective
customers standing in front of a com-
petitor's windows; and that a tailor
may be enjoined from describing his
establishment as "first class" when he
pays his workers according to the
fourth class in the scale of wages of
the local tailors' guide.

A LITTLE BUSINESS CHAT

Our readers and friends may not fully appreciate how great-
ly the work of the California Cultivator is aided by the good business men
who favor us with their advertising patronage. We could not continue
the high class of paper we are giving you without their financial help.

Perhaps you do not realize the vast amount of valuable information
to be found each week in the advertising columns of this paper and the
good to be derived from your reading the same. The columns contain a
volume of commercial facts and marketing opportunities that no progres-
sive farmer can afford to ignore.

Many fail to appreciate the assistance they can render us in our work
by giving their support through patronizing our advertisers. It is neces-
sary that we have this support and cooperation from you if we are to
keep up and improve the high standard we have set, therefore, we are
going to print a series of short stories on the benefits and merits of
advertising as a creator of better goods, lower prices and better business.
One of these little stories will appear every other week for the next
year.

We hope to fully explain many things that may not be clear to you
now.

We hope to secure your interest in our advertising columns by prov-
ing their advantages to you and how entirely worthy they are of your
careful reading.

We hope to interest you in advertising because we know advertising
has done so much for you and your friends by providing a better market
and so encouraging men to persevere in the scientific development of
many modern improvements for your benefit and comfort.

We shall prove to you that these advertisers are to be trusted and
are in every respect worthy of your confidence and patronage and that we
guarantee you a square deal at all times.

If you have any questions on this subject you would like to ask write
and let us talk it over.

This percentage should increase and
we believe will increase.

Mr. Powell has analyzed the year's
business and presented the informa-
tion in a most attractive way. We re-
gret that we could not give the entire
report in this issue, for it is not only
good reading matter for the citrus
grower but for the raisin grower, the
dried peach grower and every other
grower who has a product which he is
finding difficulty in marketing. The
exchange is not beyond criticism, but
it is a leader in cooperative effort and
every year is showing more and more
of its worth and more and more is its
example an inspiration.

In this connection permit us to refer
to a report just received from the
United States geological survey. This
report makes with satisfaction the
statement that metal production in
California in 1914 showed the largest
output of gold in 22 years. The total
yield of this state during the year was
\$20,653,496 which, with the exception
of the year 1883, was the greatest since
1864. All the metals mined in the
state aggregated during the 12 months

almost strong enough to prevent the
consummation of the deal, but at the
final election the land was accepted.
It was many years before any improve-
ments were made which gave much of
a park appearance to the land. Today
it is one of the most beautiful spots
in California. Other acres have been
added to it and a more far-seeing gen-
eration has taken hold of its improve-
ment and is providing ample means
for its upkeep. This beauty spot is
appreciated not only by residents of
the town but automobile parties with
luncheon baskets make it a gathering
place because of the shady banks
along its stream and the wonderful
view from its hilltop.

There are many towns in this state
which might well follow the example
of Pomona and secure while lands are
cheap a site which may be developed
into a restful beauty spot. It would
be a good investment and add dollars
to the value of property in the neigh-
borhood. We mean this advice not
only for the towns but for rural com-
munities which may well provide just
such a breathing spot for profit and
pleasure.

Agricultural News Notes

of the Pacific Coast

Northern California

Forty-two carloads of sheep and cattle were shipped from Chico to Oakland on August 25.

E. O. Amundsen, recently appointed farm adviser for Placer County, has established his headquarters at Auburn.

Ukiah, Mendocino County, has decided not to hold its usual hop festival this year on account of the Panama-Pacific exposition.

The board of supervisors of Mendocino County has advertised for bids for the construction of the Sand Bluff and Kelly Canyon bridges.

Farm Adviser Christiansen of Humboldt County reports that 22 farm bureau centers in that county are asking the county supervisors to appoint a county veterinarian.

A plan is being discussed among fruit growers of Oroville to establish a shipping industry in deciduous fruits by agreement amongst orchardists to plant at least 200 acres of land to shipping varieties.

A. L. Wisker, manager of the Loma Rica Ranch, near Grass Valley, has offered 50 selected fruit trees to any school district in the county which will agree to care for them in connection with horticultural instruction work.

The American Farm Company, which planted 100 acres to rice on the Shippee Ranch in Butte County, will next year plant 600 acres. Other land owners in the same district are also arranging to plant big acreages to rice.

The state fish and game commission has granted permission for professional fishermen to clear Butte Slough and the Sutter Basin of fish. It is feared by the commission that if this is not done the receding waters will leave the fish to die and decay on dry land.

The first picking of Bartlett pears has begun in Nevada County. The county horticultural commissioner estimates the Bartlett pear crop of the county at approximately 60,000 boxes. This estimate is of perfect shipping pears only.

Superior Judge Sturtevant has declared unconstitutional the recently enacted law compelling all dealers in imported eggs to so label them. This decision was rendered in proceedings brought against the president of the Master Bakers' Association of San Francisco.

One of the most attractive feature exhibits at the Gravenstein Apple Show held last week at Sebastopol was the castle of the queen, a huge Gravenstein apple. At the touch of a wand in the hands of Luther Burbank the apple opened, disclosing the queen and her court.

The directors of the Sacramento Valley Exposition Commission, representing 16 counties of the northern part of the state, met at Sacramento recently to determine what should be done with their exhibits now on display at the San Diego and San Francisco expositions. Suggestions were made that the exhibits be permanently installed either at San Francisco or Los Angeles.

Central California

Raisin grape picking is general throughout Fresno County.

Turlock is shipping out cantaloupes at the rate of 40 cars a day.

E. B. Armstrong, who has a ranch near Delano, has installed an alfalfa mill on his place.

Many fruit orchardists of Monterey County are finding it profitable to keep sheep on their farms.

Over 1000 acres of almonds were set out this season in the Oakdale section of Stanislaus County.

The Tulare Cooperative Creamery paid out cream checks amounting to \$36,500 for July deliveries.

Three Fresno packing houses have started on figs. The run will probably last until November.

An effort is being made to have Tulare and Kern Counties join the San Joaquin Valley Counties Association.

The harvest of the almond crop of the Oakdale section of Stanislaus County began the last week of August.

The Denair local of the Stanislaus County Farm Bureau will meet with Farm Adviser Connor the second and fourth weeks in each month.

Contracts have been made in the Lodi district of San Joaquin County for nearly 8000 tons of wine grapes at a reported price of \$10 a ton.

Merced is sending out every week heavy shipments of live stock. Last week's shipments comprised mules, beef cattle, sheep and calves.

The Associated Raisin Company has been requested by peach growers to market their dried peaches but has declared that it is unable to do so.

The 16 branches of the Stanislaus County farm bureau will unite in a picnic at the Crow's Landing bridge on the San Joaquin River, September 11.

An expert of the United States department of agriculture is in the Pajaro Valley investigating the strawberry industry as it is affected by irrigation.

Malaga grape picking started at Kerman, August 24. Sacchrometer tests show the Malagas running from 18 to 21 per cent sugar. The required test is 17 per cent.

The Tagus Ranch near Tulare is taking up on a large scale the fattening of beef cattle on alfalfa and grain ration. The owners expect eventually to have 1800 animals.

Codling moth is developing seriously in the Pajaro Valley apple orchards. County Horticultural Commissioner Volck recommends spraying with arsenate of lead solution at once.

The Fresno County Poultry, Pigeon and Pet Stock Association is discussing advisability of holding no other show than that in connection with the district fair September 28-October 2.

A meeting of potato growers will be held at Salinas, Monterey County, on September 20 in the chamber of commerce rooms. The state horticultural commissioner has called the meeting to consider means of handling diseases of potatoes.

Southern California

Bean growers of Buena Park, Orange County, expect a \$100,000 crop.

The harvesting of Blackeye beans is on in Orange and Ventura Counties.

The water in the Colorado River has fallen alarmingly within the last week.

California had the highest record for yield of both long and short staple cotton in 1914.

Two thousand automobiles enter San Diego County each week bound for the San Diego Exposition.

Vegetable growers of northern Orange County are talking of forming a marketing association.

Threshing of lima beans has already begun on the San Joaquin Ranch in Orange County.

The Santa Barbara News is authority for the statement that the bean crop in that county is the biggest in its history.

Buena Park, Orange County, will hold a harvest festival early this month, the date not yet being announced.

Premium lists are being distributed for the Riverside District Fair, which opens on October 5, continuing until October 9.

The California Walnut Growers' Association announces that it has only \$1500 worth of old stock unsold in Eastern markets.

Imperial Valley exhibitors of cotton at the Panama-California Exposition have received one grand prize and three silver medals.

A stalk of cotton bearing 112 bolls is on exhibition at Calexico. It was picked from the cotton field of Robert Burhans of Calexico.

Some Beaumont peach growers are peeling their fruit before drying, believing that they will secure a ready market for the peeled article.

The California Vegetable Union has leased ground for a vegetable packing house at Garden Grove. The erection of the house will begin at once.

The Beaumont Fruit Growers' Association last week shipped two carloads of Bartlett pears and a small shipment of Winter Banana apples.

The Claremont Citrus Association has paid its growers this year \$34,000 more than last year. The association shipped 496 cars of oranges during the season.

The Brock Date Garden at Heber in the Imperial Valley has been purchased by Dyer B. Holmes of Indio and the date palms will be moved bodily to his orchards at Indio.

Mr. Herbert Mathews of a large manufacturing concern of Cleveland, Ohio, is investigating possibilities of establishing a branch garden furniture factory at Los Angeles or some point in Southern California.

Various commercial bodies throughout Riverside County have organized into a central association to be known as the Riverside County Chamber of Commerce. T. C. Jameson of Corona has been elected president, H. S. Walsh, Banning, first vice-president; C. B. Lewis, Thermal, second vice-president; A. S. Dudley, Riverside, secretary; A. W. Stewart, Elsinore, treasurer.

The Coast

The Arizona wheat crop is estimated at 1,160,000 bushels.

The grain crop of the section about Pullman, Washington, will be a bumper.

Prune growers of Meridian, Washington, are preparing to start packing within a couple of weeks.

The Yakima Valley Fruit Growers' Association has announced returns on the season's cherry shipments. The association marketed 196 tons.

The sales committee of the Northwest Live Stock Show to be held in Lewiston, Idaho, November 29-December 4, is now getting out its sales catalog.

State Veterinarian Bodle of Idaho is conferring with stockmen to determine what measures should be employed in dipping sheep to rid them of ticks and scab.

To investigate pear blight W. S. Ballard of the United States department of agriculture will be stationed for several months in the district about North Yakima, Washington.

Opening prices for apples determined at the recent conference of the Northwest Shippers' League in Seattle are considerably higher than those prevailing early in the season of 1914.

All the sheep and a portion of the cattle in New Mexico are to be dipped beginning September 1, according to a recent ruling of the live stock sanitary board and the United States bureau of animal industry.

Owing to outbreak of foot and mouth disease President Hagenbarth of the National Woolgrowers' Association has cancelled the annual ram sale announced to take place at Salt Lake City on September 7.

The Northern Pacific Railway announces reductions on apple shipments ranging from 20 to 30 cents on a hundred pounds where the fruit is shipped in ton lots to central shipping points for consolidation with large shipments to Eastern markets.

The Coconino Cattle Growers' Association, recently organized at Flagstaff, Arizona, is drawing up plans for a 50-mile drift fence. The association will furnish the wire and build the fence, the forest service furnishes the posts and guarantees right of way.

The manager of the Spokane Fruit Growers' Association is urging apple growers to hold for better than a dollar per box, which is the price now being offered by a cash buyer. This official states that on a recent trip he sold over 100 cars of Spokane apples on future orders at prices well over a dollar.

The Mesa, Arizona, Farmers' Improvement Association is a reality now, the following officers being elected: E. Allen, president; W. W. Carney, vice-president; B. Winger, secretary treasurer, and C. S. Stewart and M. C. Phelps, additional members of the executive committee. Mr. Winger was elected councilman and E. Allen alternative councilman to represent the Mesa organization in the county Farmers' Improvement Association.

Building to a HIGH Standard, Not DOWN to a LOW Price

IS OUR MOTTO

If a better silo than the

Ideal Green Feed Silo

could be built, we would build it.

Our TWENTY YEARS of practical experience in silo building has enabled us to discover and eliminate the faulty features of design and construction and to manufacture a silo that is a thoroughly practical piece of equipment.

WE COULD CHEAPEN the IDEAL GREEN FEED SILO:

- BY putting on ½-inch hoops instead of ¾-inch.
- BY furnishing a door that would leak instead of the patented refrigerator, air-tight type that is an exclusive feature in the IDEAL.
- BY not furnishing a 3-ply circular plate at the top to hold the silo rigid and round and prevent its collapsing.
- BY not supplying an acid-proof, water-proof paint for the inside of the silo.
- BY making the doors serve the purpose of a ladder instead of furnishing a ladder complete within itself fastened to the silo at one side of the doors.
- BY faulty design and inferior material and construction and omitting a galvanized steel ventilator for the roof.

But if we did, you would not be satisfied with it. A silo to be of any value must be absolutely air and water-tight and of such design, material and workmanship that the shrinkage, while standing empty, can be readily taken up and the silo made just as serviceable as when first constructed without its being necessary to rebuild it every year, or to use pitch to chink up the cracks, as is necessary in others.

HIGH PRICED HOG FEEDS

Written for the California Cultivator
By W. S. Guilford

THE profits in the business of growing hogs depend upon a number of factors. One of the most important of these is an abundance of good feed that is either produced cheaply or bought at a low price.

Alfalfa and skim milk for protein and barley and corn for carbohydrates are the cheapest feeds available to most California hog growers.

Many good hog feeders, however, who depend on these feeds for the principal parts of the rations they feed, have on hand at all times a supply of some other feeds that are generally listed as "high priced." If used judiciously they prove to be cheap feeds in many instances.

Tankage, for instance, is frequently worth more than it costs when it is used to balance a ration too high in carbohydrates. Tankage has a high per cent of protein and mineral elements so that a small amount of it will make a big difference in a ration. It should generally not make up more than ten per cent of the concentrate part of a ration. It is a great aid in the development of bone in hogs, and when fed to brood sows so well supplies the protein, animal matter and minerals required that they do not eat their pigs.

Linseed oil cake meal is another feed that can be used to advantage for a part of a hog's ration under certain conditions. As five or ten per cent of a ration for sows that are being fed considerable grain, it supplies protein and keeps the alimentary tract in good condition. In the same proportion it is a good thing to help keep pigs growing rapidly after weaning, and it is a good thing to give hogs in run down condition from any cause to help give them a start toward thriftiness and growth.

Middlings is another feed that is generally somewhat high in price that is profitably used by many California growers. It is one of the best of feeds to make a "slop" feed for sows and growing pigs and is rich in protein.

All animals appreciate a variety of feeds. This is particularly true of hogs and one reason why a supply of high priced feeds to be fed when needed is good economy.

SANITATION FOR THE COW

THE cow should not be groomed, bedded, or fed immediately before milking, as these operations fill the stable air with dust and bacteria. Frequent attention to the distribution of bedding is just as important as to supply a large amount of it. Often a tour through the stables the last thing at night and a few minutes' attention to the distribution of the bedding at that time will save half an hour's work of cleaning the cows in the morning. If after each milking the manure is removed a considerable distance from the stable bad odors will be kept from tainting the milk, and the danger of contamination from filth-laden flies will be diminished. The

manure should be removed at least twice daily and never handled in the stable immediately before milking. The fly nuisance is caused by accumulations of manure in which the flies breed, and when conditions permit the manure should be removed daily to the fields. Flies carry bacteria and filth, and earnest efforts should be made to keep the stable free from them. If the stable and its surroundings are clean, free from accumulations of manure and other matter which attracts flies, the stable can be kept fairly free of them by the use of fly poison and traps. In addition to removing the accumulated manure from the gutter every day, the soiled bedding under the cow should be raked back into the gutter and replaced with clean bedding.

The feed for cows should be palatable and nutritious. Moldy and decayed feed and such feeds as may injuriously affect the cow's health or the character of the milk should be carefully avoided. The odor and flavor of milk are very readily affected by rape, cabbage, turnips, and other feeds having strong odors, and if these are used they should be given after milking, in which case there is little danger of imparting an unpleasant flavor or odor to the milk. Where pastures are overrun with garlic or wild onion the cows should be removed from the pasture several hours before milking and given a foddering of hay in the barnyard.

Owing to the dust and odors which arise from the feeding of hay, grain and silage in the stable, it is best from a sanitary standpoint to feed after milking rather than before. A liberal supply of salt should be provided in a place where the cows can have ready access to it. It is of prime importance that the cows have an abundance of fresh, pure water. Cows which produce 25 pounds of milk a day require 75 pounds or more of water daily, and instances are on record in which heavy milkers have consumed more than 300 pounds of water a day. This large quantity of water is necessary not only for the formation of milk but also for the digestion and assimilation of the large quantities of food consumed, much of which is roughage. It is not wise to permit cows to drink large amounts of ice-cold water, and in order to encourage them to drink a sufficient amount of water in extremely cold weather it is necessary to warm the water slightly.

CARE IN DRIVING STOCK

Written for the California Cultivator
By Sacramento Valley Contributor

Two fine Shropshire rams were lying along a roadside in the Sacramento Valley, dying, and a half dozen others were almost overcome by the heat. They were quite fat and had been driven too fast during the heat of the day. The two rams that died were worth \$40 or \$50 each.

It is hardly possible to use too great care in driving animals during the summer weather in the great interior valley and elsewhere in California. And the same thing holds true everywhere.

Most farm live stock is driven very

little, with the exception of horses and mules of course, and such driving as is necessary in bringing in dairy cows twice a day. But other animals are driven so little that they are sure to become somewhat excited and heated, even if the weather is cool. Add to this a temperature several degrees above 100, or more than the normal blood heat of the animal, and it requires very little added exertion to make them very warm, and if they are fat the danger point is soon reached.

It is a good plan to do whatever handling is necessary during the cool parts of the day. Sheep may be driven early in the morning, rested during the heat of the day, and moved again in the evening. The same can be done with cattle. A good time to handle hogs is during the cool of the morning. At the Butte City Ranch at Butte City in Glenn County the Berkshire

farms in connection with dairy, fruit, grain and even hogs.

There are several tons of weeds, corn stalks, second rate hay, stubble, and such things that are all suitable feed for sheep, that go to waste on many farms every year and that could well be made into high class mutton.

Ewes and lambs will eat up the "odds and ends" about a farm and pay well for the opportunity.

Here is a plan that is suggested by one practical sheep man, by which a small farmer can get into the sheep business at a comparatively small cost.

Every year there are some old ewes that are not able to maintain themselves in good condition and raise a lamb under the range flock conditions where 1500 to 2000 are kept in one band. Naturally the weak ones get the poorest of the

SOME MOHAIR

This is a photo of a never shed buck, "Dodo." It was taken at 39 months of age and the mohair shows a growth of 39 inches. Its owner, Mr. F. A. Pierce of Douglas County, Oregon, writes to the Cultivator that he will have this animal on exhibition at the Panama-Pacific exposition at the sheep and goat exhibit November 3 to 15.

There is more interest in California in the mohair industry at present than at any preceding time.

hogs are dipped in a long dipping vat containing Kreso No. 1 dip with a layer of crude oil on top. They are dipped every week to keep them free from lice and ticks and this work starts at daybreak.

They have pens in the oak woods to lie in during the heat of the day and instead of this dipping operation being dreaded both by the hogs and the men is rather an enjoyable event. The hogs grow very fond of the bath and it is fun to see them go through. It has been said that you cannot drive a hog across the road without making him shrink in weight, but when they are handled carefully in the cool of the morning the shrink is certainly very small.

A great many hogs are hauled to market at night. A big shipment went in to Colusa on wagons recently and arrived before seven o'clock. This meant that they had left home late in the evening. These hogs were in fine condition, were put in shaded yards and given plenty of water until they were loaded on the boat for San Francisco. They were kept shaded and well wet down on the boats so that from the farm to the slaughter house they were handled in a way that would appeal to any lover of stock or member of the Society for the Prevention of Cruelty to Animals.

It pays to handle stock in this way, and it is certainly a losing proposition to drive stock too fast in hot weather.

THE SMALL FARM FLOCK

Interest in the maintenance of a small flock of mutton sheep on small farms of all kinds in California is increasing and will continue to until there are thousands of flocks in the state.

They can be handled to advantage on almost all types of diversified

feed and continue to become poorer instead of getting better. If a hard winter comes or feed conditions for any reason are unusually poor, these old ewes are apt to die. Consequently the wise flock master should be willing to sell them at a considerably less price than younger, stronger ewes would bring. If young ewes, those from two to five years old, are worth \$6.00 to \$7.50 each these old ones should sell for \$2.50 to \$4.00.

But when taken out of the big flock, where they get the poorest of the feed because the stronger, younger sheep crowd them out, and given plenty of good feed like alfalfa, they pick up rapidly and soon become fat. These same good feed conditions that have made the old ewes fat will keep them that way for one or perhaps two or more years. They will produce one or two good lambs and can then be sold for mutton.

This is possible simply because of better feed conditions.

By getting these old ewes and handling them as is indicated, a small farm flock can be started at a small cost.

Then by using good rams the standard can be increased from year to year and the mutton value of the lambs produced gradually raised. Shropshire rams are very satisfactory for this purpose.

MORE LIVE STOCK WITH THE FRUIT

Written for the California Cultivator By Special Contributor

The restricted European outlet for California fruit and the low prices for some kinds that result from this and other reasons are causing many fruit men to think of some way to assure an income from their places with products other than the fruit.

It has many times been stated in

DAIRYMEN— Read this Letter

Chino, Cal. July 15, 1915.
THE LARROWE MILLING COMPANY.
Gentlemen—As one of the largest users of Larrowe's Dried Beet Pulp in Southern California, it gives me a great deal of satisfaction to be able to recommend it not only as an economical feed, but also as a most efficient one; and as a supplement to alfalfa, I know of no grain its equal.
We feed dried beet pulp without molasses, and have probably used it more extensively in connection with feeding calves and young stock than any one in California. Our calves are allowed to eat all the beet pulp they want from the first, and receive an average of about six pounds per day until two years old. The results are more than satisfactory, and we accomplish a growth of from 800 to 900 lbs. in our heifers when but twelve months old.
In feeding for Official Test, beet pulp is used when but winter we broke all Southern California records, making as high as 28.85 lbs. butter in seven days with a full-age cow, and 18 lbs. with a two-year-old heifer. We attribute our success largely to dried beet pulp, as no roots or ensilage was fed at all to these cows, nor to any of our cows that made large Official Records. One cow, after being taken off Dried Beet Pulp and Alfalfa Hay, first-calving twice a day, and receiving nothing but Dried Beet Pulp and Alfalfa Hay, first-calving entire herd, including a number of the heifers, is milking, according to the figures of the District Tester, better than 40 lbs. per day. We could not do without dried beet pulp.
Sincerely,
(Signed) McALLISTER & SON,
By James W. McAllister, Jr.

from one of the best known and most successful Holstein-Friesian breeders in California

TEST IT ON YOUR COWS

You can find out for yourself the real worth of Larrowe's Dried Beet Pulp by ordering a single 100-lb. sack from your dealer and feeding it to one cow whose milk record you know. It may be had either plain or with molasses. Ask your dealer.

M. BASSETT Hanford, Cal.

the Cultivator that no single crop agriculture has ever succeeded anywhere in the world for any long period and that every California orchard should have a live stock department.

Those who are starting fruit farms will do well to set aside a part of the acreage for growing food for animals and provide barns and corrals so that they can be suitably cared for.

What a fine thing it would be this year if fruit growers could say: "Well, I would like to market my fruit as a fruit crop, but with the hogs and sheep and cattle that I have and can get, I will be able to get a price for it that will not make a loss on the cost of production because there will be big packing costs that I will avoid."

This very enviable situation is one

of the best son of Colantha Johanna Lad who is the greatest living sire of large milk producers in the world, and other high record cows and magnificent individuals such as have never been offered in the West with the exception of our Sacramento sale on October 6 and 7.

Where else could a breeder go out and buy such animals? He cannot bring any stock out from the East for many months on account of new outbreaks of the foot and mouth disease last month in New York, Illinois and other states. Never before has such an opportunity been offered to California buyers, and it is up to them to take advantage of this chance and secure stock in which there are many 30 pound possibilities. Because of the tightness in the money markets these breeders have been compelled to part with stock that they would not have

De Kol Hengeveld Burke

that every fruit grower should make an effort to be in. All cannot do it, of course, but these ideas may reach many who can begin in such a way as to bring this about, or others who can rearrange their affairs so as to do it.

There are few fruit farms that cannot carry a few hogs without much trouble. They must have some alfalfa for pasture, and some grain will need to be bought, but the litters can come in the spring or early summer so that the pigs will be getting good size when the refuse fruit is to be consumed, then they will be in good condition for finishing on grain later.

There has been some discussion in the Cultivator about sheep to be kept in connection with an orchard, and this interest is manifest in many places throughout the state. A few sheep can well be kept to clean up along ditches, in cultivated fields and elsewhere as weeds and grass appear.

One of the biggest subjects before California farmers today is "More live stock—how to get it and take care of it."

HANFORD HOLSTEIN SALE

The California Breeders' Second Consignment Sale to be held at Hanford on October 14 and 15, consisting of 175 head of the highest class registered Holstein cattle, we think is bound to set a new standard for consignment sales in the United States.

The first Breeders' Consignment Sale averaged \$397 per head for 97 animals, which was by far the greatest average of any of the numerous sales of pure bred cattle held last fall in America. This year however there will be almost twice as many head sold and several times the number of high record cows. Last year there were only granddaughters of the great sires of the breed while this year there will not only be numerous granddaughters but any number of daughters of the world's greatest bulls. There will be a complete dispersion of the C. C. Lester herd of Gilroy, of 65 head, and the rest of the consignors have promised me that they are offering the very best animals out of their herds, and there are none too good or well bred to be spared. Twenty-five cows with records as high as 29.90 pounds butter in seven days as a four-year-old, 30 daughters of great record cows, including two daughters of the 29.90 pound four-year-old, one daughter of a 30 pound cow, and many others above 20 pounds; 15 daughters

sacrificed before under any conditions. We do not expect however the prices paid for the stock to be commensurate with its value because of the financial stringency, and it behooves every breeder therefore who wishes to make money to be at Hanford in October at the big sale.—J. W. McAlister, Jr., Sales Manager.

CHEESE MAKING

(Continued from Page 243)

in curing, that is, three months or more as against two to three weeks for the California, necessitating greatly increased storage space, more carefully constructed curing rooms, and possibly cold storage in the hot weather. (5) Owing to the longer time for curing and before cheddar cheese can be marketed the money is tied up too long.

Gilroy factories make either a stirred curd or half cheddar. The difference lies in the method of handling the curd after the whey is drawn. In the former the curd is stirred frequently with the hands to prevent its matting together. Salt is mixed with the curd and in a half hour to an hour it is ready for the press. In the half cheddar process the curd is allowed to rest in the vat until it has matted, then it is cut into large bricks with a knife. These bricks are turned at intervals to keep them of an even temperature throughout and to allow the whey to drain out. In a half hour to an hour they are put through a curd mill which cuts them into small squares. Salt is then added and soon the curd is put into the press. The full cheddar process consists in carrying the curd along for two or three hours more in the brick form before putting through the curd mill.

Gilroy cheese men all say they receive in San Francisco a premium on their cheese to the extent of one cent above the quotation for California Fancy. This in addition to the reasons given above makes them loath to change to the full cheddar process. In a San Jose grocery the other day I saw cheese marked "California 18 cents," "Gilroy 20 cents." The adage "A prophet is not without honor save in his own country" does not apply to Santa Clara cheese. I brought home from Gilroy a few pounds of half cheddar two months old, and if I could always secure as good California cheese I would not be asking my grocer for "eastern."

Poultry for Profit

THE COCHIN AND ITS INFLUENCE

Written for the California Cultivator
By Jean A. Koethen

IT was in 1843 that Her late Majesty Queen Victoria received from the British ambassador to China a present of five pullets and two cockerels. These birds were called in various descriptions of them "Cochin-China fowls," "Cochin fowls," and "Shanghais," and the names Cochin and Shanghai seem to have been applied at that time indifferently to all the birds of this breed, though they differed somewhat in color, shape and feathering.

These Shanghais or Cochins which were introduced into England in the early forties and to America probably about the same time, though we have no authentic record of them prior to 1853, were epoch-making birds. They were very large and very hardy and had been bred to quite a high state of perfection by the Chinese.

Their introduction both in England and America created more enthusiasm than has ever been awakened by any other breed. The great vogue of the White Orpingtons a few years ago was nothing to it. They were reported to produce, not a single egg per day, but two or three, and their size was greatly exaggerated. They were of various colors, being mainly white, black and the whole gamut of buff and yellow shades. Some were tall and rangy, some medium, some rather short; they were mostly feather-legged, but some legs were clean. They were all coarse feeders, and got fat on it; never wished to fly and were contented and happy in a grass plot with a fence two-and-a-half feet high. The breast was tender and juicy but somewhat deficient in quantity, but this was fully counterbalanced, so their admirers claimed by the very large legs and thighs.

This rather mongrel bird, as it seemed when first introduced into America, was at once taken up by fanciers, and a real American type was developed, with full, round breast, thick fluff and short leg as it exists today, but the original bird served in large part as the foundation for three other breeds, the Plymouth Rock, the Wyandotte and the Buff Orpington. Being extremely hardy, of great possibilities as a meat producer and withal a bird easily bred in confinement, its value was at once realized by breeders and many attempts were made to incorporate these qualities into a breed which should also be a producer of many eggs.

The Plymouth Rock

The first fowl to bear the name of Plymouth Rock was developed about 1849 by intermingling Cochin, Dorking and Malay blood. The Dorking was the best of English table fowls and the Malay a very hardy breed brought from southeastern Asia by sea captains. The breed produced by this mixing of blood was a mongrel and of little value. It was 20 years later that D. A. Upham exhibited in Worcester, Massachusetts, the first

Barred Plymouth Rock, which was bred from a cross of a Single-comb Dominique male and a Black Cochin. Other breeders obtained similar results by other crosses, the most notable of which were: Black Spanish and White Cochin top-crossed by Dominique; Black Spanish and Gray Dorking, top-crossed by Dominique (gray strain); Dominique and Buff Cochin; Light Brahma, White Cochin and Dominiques (Drake strain).

The Upham strain was the foundation of another strain known as the Pitman strain, and this in turn was improved in 1876 by H. B. May who crossed it first with the Light Brahma and later with the Grade Game, which latter cross is held responsible for the great stamina of the breed and its great weight combined with moderate size. It seems probable that the best of our modern Barred Rocks date back to this strain.

White Plymouth Rocks originated in sports from the Barred variety. It was to be expected that the white of the Cochin cross would crop out occasionally in later generations, and when about 1875 a Maine man by the name of Oscar Frost hatched white chicks from Barred Rock eggs, plenty of Barred Rock fanciers were ready to admit that they had had the same experience. These white chicks all had the Barred Rock shape. They were not at first pure white, but after several years of careful mating were found to breed true. All these white sports seemed to come from either the Drake strain, which contained the White Cochin cross, or from another strain called the Essex, into which a fowl called the White Birmingham had been crossed. Just what this White Birmingham fowl was I have been unable to find out. It seems to have disappeared from the records except for an occasional reference.

The Buff Rock is of different and much later origin than the other two, having been first exhibited in 1890. There were two original strains, the Wilson originating with J. D. Wilson of Worcester, New York, from Buff Cochins and Light Brahmas, and the Fall River, produced by several fanciers at Fall River, Massachusetts, by crossing Rhode Island Reds and White Rocks, and also from Rhode Island Reds which had some Plymouth Rock blood in their veins and were of the buff shade into which the rich Rhode Island Red color sometimes degenerates.

The Wyandotte

The origin of the Wyandotte is shrouded in obscurity. In the early eighties J. Y. Bicknell, secretary of the American Poultry Association, wrote: "I hope you will not accept the statement of anyone as to a knowledge of the origin of the Wyandottes, for there is not a living man who knows when they made their first appearance." Mr. Bicknell also said that as early as 1866 birds similar to the Wyandottes were bred in Oneida County, New York., and that a Mr. Payne made an attempt to have them recognized by the association in 1877, but "failed simply because the specimens offered as samples were

pronounced unworthy of recognition." Just after they were admitted to the Standard in 1883 I. K. Felch wrote "It was, without doubt, the intention with the first cross to produce an improved Cochin Bantam, the cross being a Seabright Bantam cock with a Cochin hen. When the size proved too large, they were offered and illustrated as Seabright Cochins. This suggested the cross of Silver-Spangled Hamburgs with Buff Cochins. These two crosses, mingled with another cross through a Cochin hen, became the blood mixture of the early birds offered to the American Poultry Association as American Seabrights."

The name "Seabright" which Mr. Felch uses above is associated with portions of New York and Michigan, where birds known as Seabright Cochins, Seabright Brahmas and American Seabrights had been bred a number of years. It was these same portions of New York and Michigan that had formerly been the hunting grounds of the Wyandotte Indians, and so, when difficulty as to the name arose among the fanciers seeking to get the breed admitted to the Standard, the suggestion of the name Wyandotte came as a happy solution of the problem. The Mr. Houdlette who suggested the name admitted afterward that the name of a coasting-vessel once owned by his father was in his mind. Whatever the actual idea contained in the name, it was adopted at once, and is still the name of one of our most valuable breeds, but there seems to be no doubt that the name "Seabright Cochin" was the original name of the breed.

The original Wyandotte, when admitted to the Standard, was much like the Silver Wyandotte of today. The males were similar to the Dark Brahma in both form and color, the females had the form of our present Silver-Spangled Hamburg females with grayish-white breasts and backs, sometimes with darker ticking. It was received with great applause, and a tremendous boom followed, which soon fell flat, as all booms do, but the Wyandotte has steadily won its way to favor because of its good size which is just right for the Sunday dinner for a small family, its rapid growth and its early and continuous egg-production.

The Golden Wyandotte was the second variety brought before the public and was the result of crossing Rose-Combed Brown Leghorns, Pea-Combed Partridge Cochins and some Buff females. The males from this combination were mated with American Seabright females.

The White Wyandotte originated as a sport from the Silver, as did the Black. The Buff Wyandotte, early in the nineties, was bred from a cross of Silver Wyandottes on Rhode Island Reds, this cross being bred later to a Cochin cross. W. R. Wooden of Michigan, when sec-

Adams Pipe Works, 2025-39 Bay St. Los Angeles. Bdwy. 1264 F1917
Under entirely new management

A-1 FISH MEAL

will get the Fall and Winter eggs. It contains ten per cent more protein than any other Fish Meal on the market, giving ten per cent more efficiency. It contains less than five per cent Oil. This is from five to fifteen per cent less Oil than any other meal. This is a decided advantage as the Oil not only becomes rancid with age, but it carries the Fish flavor and a high percentage of oil is liable to give the eggs and flesh of the fowl a fishy flavor. A-1 is guaranteed not to impart a fishy flavor. Write for sample.

FARM LANDS FOR SALE

FARMS WITHOUT MONEY
We have 20 acre homes for twenty families. Level Sacramento Valley loam soil in Sutter County, 1/2 mile from Electric Ry. depot.

WE WILL WORK WITH YOU AND WAIT TILL YOU GET THE MONEY. No cash payment. All we want is for you to be a practical man and to put up a dwelling to cost not less than \$150, an electric irrigation plant giving 18,000 gallons per hour, which we can furnish for \$130 and a well which will not cost over \$75.

WE WILL PUT THE LAND IN AT THE REDUCED WHOLESALE PRICE OF \$115 PER ACRE.

No interest the first year; 7% the second year and \$10 per acre the third year. Balance to suit.

WE WILL MAKE EVERY ONE OF OUR CUSTOMERS A SUCCESS, but you must act now to take advantage of this offer. Come now and make your choice.

WATT and Co.
621 J Street Sacramento, Cal.

The owner of 3000 acres near Madera desires to subdivide for real settlers; the land is typical San Joaquin valley loam, free from alkali, and will grow anything; railroad crosses property and there is abundant water at shallow depth; the land is for sale at the right figure to people with proper qualifications; no cash payment down and terms to suit, provided the purchaser has sufficient money to put the land under water. Remember that there are no real estate commissions to pay to swell the price of the land; all the owner wishes is interest on his money. No real estate agents need apply.

GREENE ESTATE COMPANY,
207-208 Berkeley Bank Building,
Berkeley, Cal.

Carlsbad irrigated lands—bordering ocean; on State paved highway and Santa Fe Ry., 80 miles south of Los Angeles. Government records show Carlsbad warmest in winter, coolest in summer of any spot in California. Deep soil, model water system, low rates. Lemons mature in summer when price is highest. Immense profits in fruits and berries adaptable to coast territory. Winter vegetables without competition. Minimum temperature 1914 was 41 degrees. Tomatoes, chili, peas, beans, eggplant, rhubarb, etc., bring \$150 to \$400 per acre. Easy purchase terms. Liberal leases. **SOUTH COAST LAND CO., GEORGE BUXTON, SALES AGENT, CARLSBAD, CAL.**

I know of three or four breeding pens at the present moment, of proven value, that are for sale. Their owners have all the stock they want and would gladly sell at a comparatively low sum while they still have a breeding price. I would here express the opinion that many poultry breeders keep their stock birds far too long. I have often been astonished at the age of some prospective parents in the breeding pen, referred to with pride by their admiring owners. The Age of Faith is certainly not yet past. Anyhow it is at dead times like the present that the man of small means has the chance to pick up stock that otherwise would be beyond his reach.

In the purchase of breeders there is one point that can not be too strongly enforced, and that is to make it a strict rule to buy none but hen hatched birds. I repeat it, let none but hen hatched and, if possible, hen raised, birds be the parents of your chickens. And I would go farther and urge that the grand and great grandparents of your stock be the same. In other words, for stock purposes buy only from people who make a practice of natural incubation. I intend no reflection on artificial incubation. There are plenty of good machines and also of very clever operators and considering the happy-go-lucky character of much of the mating there is an astonishing quantity of useful chickens turned out but, a big but, Nature's machine is still unbeatable.

The ever increasing demand for great blocks of day old chickens makes it practically impossible to insure anything like the observance of sound breeding principles, and the thoroughly reliable strains are very few. I suppose the fingers of one hand would cover all the White Leghorn farms of California from which many men would think of buying eggs or stock. What is their output compared with the hundreds of thousands of chickens that go "somewhere"? And of the survivors of the chickens that go "somewhere" how many are destined to be the parents of another generation, regardless of what their own parents were or of how they themselves first saw the light? Yet people are astonished when chicks are hard to raise, bad doers, and money losers instead of money makers. It would be astonishing if it were otherwise. Personally I believe that a good half of the poultry diseases of our day are caused by the country being flooded with incubator hatched birds, not of one generation only, but of two, three, four and often more generations old. It can't be done. The only satisfactory reproductive machine in the poultry world

is the one designed and perfected by the Master of even the cleverest craftsman, and we shall be wise if we let it rest at that, so far as our purchases of breeding stock are concerned.

A short time ago I saw over the gate of a pen on a moderately successful poultry farm the following: "The sins of the fathers upon the children, incubator chickens in the third and fourth generations." Inside were creatures which belong to the things that are said to make angels weep. But so long as there is the demand amongst poultry people for quantity first, quality second, they will get just exactly what they ask for; and if things go wrong they can blame nothing but their own folly. For there is good stock to be had; it is not as cheap as the other, but it is the only sort worth buying. A little of it bought at a favorable time (for instance, like the present), handled with judgment, and allowed to increase by natural means, can not fail to be a sound investment and one there will be no cause to regret.

My second reason for discussing the purchase of breeding stock at this time is this: For a long while the cry has been that poultry affairs are at a very low ebb. Well, isn't this just where the tide has got to turn? So don't be alarmed, but get into the business at once, if you have been seriously thinking about it, and let the tide, which must be ready to flow, carry your ship right into the harbor of prosperity. And if the egg tide is very low it means that the capital you want to spend will go an extra long way. It means that stock of the right sort, the sort you must have, is cheap enough to buy. Why shouldn't you have some of it? And feed is reasonable, too. Then why hesitate? This is your opportunity. Get started at once in what, remember, is a staple industry, on the most favorable terms. If you know anything at all about poultry and are willing to learn the rest you need have no fear. Only remember to start with a few really good ones, hen hatched, of course, and then let your business build itself up gradually and naturally. As for the fellow who can't be happy without a crowd, let him have it; he might just as well spend his money in that way as in any other. But be you wary, my friend, and start right anyway.

There are many ways of treating hogs to eradicate lice. The common method is to corner the pigs with two hurdles and apply crude oil by means of an old broom. Kerosene and lard made up in equal proportions also makes a good preparation to be applied in this manner. Sometimes an oil can is used to pour kerosene along the backs of the hogs. This is splendid for killing lice, but it is too active, as it will remove the hair and blister certain parts of the skin.

Queries

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Irrigating Small Fruits

How often should berries and fruit trees be irrigated during the fruiting season? The soil is heavy loam, packing very hard and rock-like if not continuously cultivated.—Subscriber, Alhambra.

So much depends upon the tree and the size of the crop it is carrying, the soil and the subsoil that it is impossible to answer such a question excepting in the most general terms. The rule of irrigation is to give water when it is needed. This is best shown by the condition of the tree, but the soil should never be allowed to pack under any circumstances. This should be prevented by cultivation at the proper time after irrigation or else by heavy mulching. If the trees are irrigated, say once every month or six weeks (and by irrigated we mean so fully supplied with water that the very lowest depth of the roots are reached), then one or two thorough cultivations at the proper time after irrigation should be sufficient. Too many irrigators give only surface irrigation which compacts the surface soil and causes more loss than benefit to the tree. With small fruits, however, it is impossible to carry on most soils near Alhambra unless irrigated at least every week or two. We judge in this case our inquirer irrigated with the hose, and we think that with the small fruits if he would use the irrigation ditch method, then give heavy application of a good mulch, it would be the best way to handle these fruits.

Registering Jerseys

An inquirer recently requested information as to possibility of securing registry for a pure-bred Jersey whose pedigree has been lost or, if this one animal cannot be registered, if she is served only by registered bulls how many generations must elapse before the offspring may be eligible to registry. We answered in effect that that time could never come. However, we referred the question to Secretary R. M. Gow of the A. J. C. C. Secretary Gow writes: "In order to register an animal both its sire and dam must first have been entered in the Herd Register of the A. J. C. C. The breeding of an ineligible Jersey cow to registered bulls would not produce offspring which would be recorded with us. You are therefore correct in your view of the matter as stated to your inquirer."

Re-setting Orange Trees

When should two-year-old orange trees be re-set? I have two small orange trees planted some two years ago. They have had every attention, yet they look exactly as when first set only not so fresh. I now need to move them. Are they worth saving?—Subscriber, Alhambra.

Either March or May is usually preferred as the time for moving trees. Some maintain they can move the orange almost any month in the year but when moved at this time if the new growth which usually follows re-setting should start and we should be given an early frost injury to the trees might result. In the case of the trees referred to, however, which have not grown for two years we question whether we would bother with them at all. There may have been something wrong with the roots and it would not pay to bother with such trees at the present prices of good, thrifty stock.

The construction of the dairy barn may be less important in keeping down the bacterial count of the milk than careful methods in handling milk. Proper construction, however, lightens the labor necessary to keep the barn and its equipment in a clean, sanitary condition.

The Household Department

THE VETERAN

By Thos. J. Taylor

Ay, sell him, now the old-time fire
Burns feebly in his breast!
Forget the past, the proud desire
To do his level best.
He's willing yet, but sinews fail
When years a number flock;
He'll bring a pittance at the sale,—
Ay, send him to the block!

Forget the day you drove him home,
Lest memory loose a tongue;—
The burst of speed, the flying foam,
The pride of strength unwrung.
No retrospection, if you please,
Pass all that's gone before;
The wine is drunk, who wants the lees?
Go, spurn him from your door!

What matter though his faithful heart
Shall mourn the homely stall?
Why fear his shrinking sides may smart
Beneath the lash's fall?
Pull up the roots and chance the blow,
Waive sentiment, I say;
He's but a chattel, let him go
For what the crowd will pay.

He has no words wherewith to plead,
Did he your purpose rate;
Nor knows the menace of the steed
That paws without the gate.
Hail, then, the young, with life awing!
Let useless age make room—
The King is dead. Long live the King!—
Ay, send him to his doom!

OLD TOM

John Potter mounted the veranda steps with an apprehensive heart. Yet he reassured himself. "Women are such silly sentimentalists in such matters—always letting their sympathies run away with them."

"Better brace up and tell her—the sooner the better."

Mrs. Porter looked up smilingly from her letters which the postman had just left. Her pleasant attitude made his task the harder. But feeling that the dreadful ordeal would give ease to his troubled conscience he sat down and began.

"Now, Doris, you mustn't take on over what I'm about to say. I've sold Old Tom. I hadn't expected to sell the old fellow; I'm sorry already, but I had a chance to get fifteen dollars for him, and if he couldn't have got rid of that cough and rheumatics, even a jockey soon wouldn't have bought him for three."

Porter expected a protest of words, but there was complete silence. The accusing sentence of a court of justice could not have given him a keener torture.

At last, in a strange tone his wife inquired:

"Who bought Old Tom?"

"Tony Menzi."

"That huckster that was around yesterday?"

"Yes."

"Has the man gone?"

"Yes, he started with him for the city at three o'clock this morning."

Then Mrs. Porter "spoke."

"John, I'm going to say something I've never thought, felt, or said before! I'm ashamed of you! You've often made a protest at cruelty in the community, but what have you done but a thoughtless and cruel deed? Tom gave us 20 years' work for nothing but his board. He's hardly ever had a whole week-day of rest. It's

been Tom here and Tom there, always put to do the extra jobs, and trips to town often when he was tired out. And now, just because he was getting old and lame and had a cough, you've sold him to a life of misery and neglect. I thought you despised a traitor. But what else have you been to Old Tom? I wish I could at least have said good-by to him and told him how faithful he has been!"

Porter knew he had the wrong side of the argument, yet he made a spirited defense, saying that farmers were a practical sort and couldn't let "chicken-heartedness" stand in the way of business.

Seeing his words of no effect, a happy thought struck him.

He took out his pocket-book and tossed three five-dollar bills into his wife's lap.

"I heard you talking about a new dress the other—"

But she did not wait for him to finish.

"Do you think I could wear a dress bought with the price of Old Tom? I'd rather wear a three-cent calico!"

Little more was said, but each day at the time Porter had been used to prepare Old Tom's bran mash he had a strange sense of remorse and longing for the faithful old creature, and a feeling of loneliness came over him as he passed the empty stall.

Over a year later, Porter on a business trip, was driving his "machine" through a beautiful section of country several hundred miles from home.

He heard angry shouts and saw a short distance ahead a heavily loaded wagon and a fallen horse.

Something was wrong, and he stopped his auto.

The wagon was twice too heavily loaded for the old horse that evidently had passed from one master to another and had at last become the victim of the jockey and been sold to an ignorant, coarse peddler.

The man had been whipping the horse, but finding that of no use was securing a fence-rail to further beat the old creature.

"Put that club down!" commanded Porter. "What's the trouble?"

The peddler obeyed, pointing angrily to the horse and wagon.

"He notta no good! I pay t'ree dollar! Man cheat. Horse notta no good! I kill him!"

Porter freed the horse from the miserable, ill-fitting harness. A faint neigh of recognition greeted him. It was Old Tom!

"It's the first time John ever forgot," thought Mrs. Porter with a wistful smile as the day passed on to afternoon and no reference was made to her birthday. The pleasing little "surprise" gift that always marked the day was lacking.

She heard voices at the side veranda and going out, was greeted by a sight that filled her eyes with joyful tears. Her birthday gift had not been forgotten! Old Tom's familiar face greeted her—just a shadow of his former self, silent as to the harrowing experiences of the past year, but neighing for joy at the sound of her familiar voice.

1914

Wholesale selling price:

Sacramento Valley 8
Sonoma-Mendocino 11½
Oregon Clusters 11½

HAY

Under date of September 4, 1915, Scott, Magnier & Miller say:

Receipts of hay for the past week were 5311 tons, the preceding week 4100 tons. This is an immense amount of hay to arrive in one week under ordinary conditions a weak and lower market would be quite natural. Surprising as it may seem,

these arrivals have moved off in fine shape without any congestion whatsoever and without any concessions in prices. This would indicate that consumers are commencing to appreciate the fact that the grain hay crop is decidedly short this season and are laying in their winter supply to a more or less extent, thus taking care of these heavy arrivals. It is generally acknowledged that the alfalfa crop is short this season, which, together with a short grain hay crop, gives every evidence of a prospective firmness to the hay market throughout the year even though there is no abnormal export demand and prices are based solely on local demand. However, as there is much inquiry at the present time for foreign shipment it is hard to predict at this time what the hay market is liable to be throughout the winter and spring months but it is generally conceded that prices will be considerably higher than at the present time. The fields are fast being cleaned up and we do not look for as large receipts on this market from now on. The export trade continues to be normal in quantity, which in itself helps to maintain the market. The alfalfa situation is strong, receipts moving off very freely and at top quotations.

We quote the average wholesale price of hay in carload lots on today's market as follows:

Fancy Wheat Hay (lt. bales)	14.00@15.00
No. 1 Wheat or Wheat and Oat	12.00@13.50
No. 2 Wheat or Wheat and Oat	8.50@10.50
Choice Tame Oat	12.00@13.50
Other Tame Oat	9.00@11.00
Wild Oat	7.00@10.00
Alfalfa	10.00@13.00
Stock Hay	5.00@6.00

GRAIN

Alfalfa Seed	16 1/2
Wheat, Cal. Club	1.57 1/2 @ 1.60
Barley Feed	1.17 1/2 @ 1.20
Corn, Eastern Yellow	1.79 @ 1.80
Oats, Red, Feed	1.20 @ 1.35
Oats, White, Feed	1.40 @ 1.42 1/2
Millet	2 1/2 @ 3 1/4
Flaxseed	5 @ 5 1/2
Rye	2.00 @ 2.25

FEED STUFF

Wholesale prices:

Alfalfa Meal, car lots	16.50@17.50
Bran, ton	27.50@28.50
Feed Cornmeal	42.00@42.50
Cracked Corn	42.00@42.50
Roller Barley, ton	25.50@26.50
Middlings	32.00@35.00
Shorts	28.50@29.50
Oilcake Meal	36.00@37.50
Cocoanut Oilcake Meal	22.00@23.00

Citrus Fruit Market

LOS ANGELES, September 8, 1915.

Good Valencias are commanding good prices in all markets. Lower grade fruit is still unsought though it is not refused entirely. The Eastern markets are being filled with large quantities of local deciduous fruit. Shipments very light. There is nothing to say as to the lemon market other than that it is simply "in bad."

Shipments

Shipments of oranges to date from Southern California, 31,477 cars, lemons 6203, total 37,680. To same date last season: oranges 35,917, lemons 2673, total 38,595. From Tulare County to date: oranges 5649, lemons 202, total 5851. To same date last season: oranges 5875, lemons 32, total 5907. From northern counties: oranges 630, lemons 2. To same date last season: oranges 404, lemons 5.

NEW YORK, September 7.—Twelve cars Valencias, one mixed car and six cars lemons sold. Market firm, slightly higher on Valencias; lemons doing better on fancy sound stock, unchanged poor stock. Cloudy.

War Eyes

Perfect eyesight is one of the requisites of the army recruit. He must be able to see straight in order to shoot straight. In battle or at the work bench, desk or sewing table, good eyes are indispensable. Have you "war eyes" or weak, "tired" eyes? Dr. Isaac Thompson's Eye Water (introduced 19 years after the war of 1776) is both a remedy for weak, inflamed eyes and an ideal eye wash. It's only 25c the bottle at your drug store, or John L. Thompson, Sons & Co., 159 River St., Troy, N. Y. Booklet FREE.

CHICAGO, September 7.—Fruit and vegetable markets were pretty thoroughly cleared out before the three-day holiday, but fresh consignments had accumulated today and prices were shaded somewhat. Cantaloupes—Standard cases 45 melons, California, 1.75@2.00 up to 2.50 for fancy stock; pony crates, 1.25@1.50 down to 50 for soft stuff; flat cases, pink meats, California and New Mexico, 1.00@1.15. Casabas—Slow sale; cases California, 1.35@1.50. Apples—Best varieties; barrels, 2.50@3.75. Lemons—Boxes, California, 2.25@3.00. Oranges—Boxes, California Valencias, 4.50@5.00; off sizes, 3.50@4.25. Grapes—Cases 4 baskets, Tokay, 1.50@1.75; Malaga, 1.00@1.25; seedless, 1.15@1.25. Plums—Cases 4 baskets, seven California varieties offered 75@1.00. Pears—Boxes 50 pounds, California Bartlett's, 1.50@2.25 down to 1.25 for overripe; Washington 1.40@1.85.

HOUSEHOLD QUERIES

(Continued from Page 261)

each 100 cucumbers boil six quarts of water with three-quarters of a pound of salt. Allow this to thoroughly cool, after which add seven cups of vinegar, pouring over the prepared jar of cucumbers. On this place a cloth, then a board fitting into the top of the jar (leaving a small space around for the liquid to rise) and weigh it down with a sandstone so that the cucumbers will always remain under the liquid. Place in a moderately warm, dry room. At the end of ten days to two weeks remove the cloth, board and stone, also any scum that they may have gathered, wash carefully, and cover again as before. Usually in 30 days the cucumbers are ready for the table as luscious dill pickles. A four-gallon jar requires two pounds of green dill, though more can be added if the flavor is liked.—Mrs. G. Esterbrook, Los Angeles.

PICKLE RECIPES

Cucumber Pickles

Three quarts cucumbers, one quart small onions. Soak in salt water a day or a night. Wash in cold water. To sufficient vinegar to cover pickles, add two cups brown sugar one-half cup Coleman's mustard, ten cents worth of tumeric and some celery seed if de-

sired, also one peppercorn. Salt to taste. Cook five to ten minutes. Place in jar and completely cover with vinegar. Seal.

Chopped Pickle

Two quarts chopped tomatoes, one head of cabbage chopped, four onions, chopped. Sprinkle with salt and stand over night. In the morning drain and cover with the following:

To sufficient cold vinegar to cover add one teaspoon cinnamon, one-half teaspoon cloves, one-half cup grated horseradish one-fourth cup whole mustard seed, a little cayenne pepper, two chili peppers chopped fine, four sweet peppers, one large cup sugar. Mix well and bottle without cooking.

FARM BUREAUS

(Continued from Page 248)

farm improvement association be formed in that district. A meeting was held on September 9 for the purpose of perfecting the organization.

Blackman, Griffin Company of Ogden, Utah, are in the market for alfalfa seed and want samples from this district. This firm in correspondence with Farm Adviser J. A. Armstrong states it will be glad to receive samples of recleaned or rough seed and will quote prices on either. They furthermore agree to accept and pay for the seed F. O. B. cars. Anyone in-

terested may send samples direct or send them to the farm adviser and he will forward them.

The management of the Bartlett-Heard ranch south of Phoenix has instructed one of their men to spend his entire time applying London Purple to the nests of harvester ants in their fields.

The farm adviser has been told many times that alfalfa would get yellow and stop growing in this valley during August and September on account of the hot weather. This however, is not true. It is true that it gets yellow and stops growing but the hot weather has nothing to do with it. It is caused in some cases by the failure of certain types of land to take water but in the great majority of cases to ravages of insects. The first trouble may be corrected by subsoiling and in the second case if every rancher would keep a flock of turkeys commensurate with his alfalfa acreage he would find that the alfalfa would grow in a very satisfactory manner in our hottest weather.

Several railroads in the southern part of Russia now allow agricultural machines and implements precedence over all other classes of private goods, giving such freight the same privileges of speedy transport as are enjoyed by perishable goods.

A Guaranteed Worm Expeller

GILBERT HESS, M.D., D.V.S.

Worms are responsible for nine-tenths of your hog troubles at all seasons of the year, but especially in the fall. Do not be misled, thinking your hogs have some other ailment. Nine times out of ten their trouble is worms. My Stock Tonic will positively expel these worms and keep your hogs in a healthy condition, thereby enabling them to resist disease and lay on fat. Feed my Stock Tonic to your hogs right now.

Dr. Hess Stock Tonic

Makes Stock Healthy—Expels Worms

25-lb. pail, \$2.25; 100-lb. sack, \$7.00

Why pay the peddler twice my price?

It isn't enough to rid your hogs of worms, mark you. You must also tone them up and put them in such a clean, vigorous condition as to make worm development impossible. That is why my Stock Tonic not only contains vermifuges to expel the worms, but it also has in it tonics, blood builders and laxatives to build up and regulate the animal's system.

My Tonic is highly concentrated, as the small dose quantity will prove, and as I have no horses, wagons and salesmen to pay for, I can sell you at rock-bottom prices through your local dealer.

My Stock Tonic also aids digestion and assimilation, makes your hogs and other stock thrive; it is the result of knowledge which I have acquired as a veterinarian, doctor of medicine and stock raiser. Formula on every package.

So sure am I that Dr. Hess Stock Tonic will keep your stock healthy and expel worms, that I have authorized my dealer in your town to supply you with enough Tonic for all your stock and, if it does not do all I claim, just return the empty packages and get your money back.

25-lb. pail, \$2.25; 100-lb. sack, \$7.00, smaller packages as low as 50c. Send for my free book that tells all about Dr. Hess Stock Tonic.

DR. HESS & CLARK, Ashland, Ohio

Dr. Hess Poultry Pan-a-ce-a

A splendid tonic during the moulting period. It gives the moulting hen vitality to force out the old quills, grow new feathers and get back on the job laying eggs all winter. It tones up the dormant egg organs and makes hens lay. Also starts the pullets to laying. Economical to use—a penny's worth is enough for 30 fowl per day. 1 lb. 25c; 3 lbs. 50c; 7 lbs. \$1.00; 25-lb. pail, \$3.00. Guaranteed.

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks and dust bath. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 25c; 3 lbs. 50c. 1 guaranteed.

If you have a sick or injured animal, write me, giving symptoms, and I will send you prescription and letter of advice free of charge. Send 2c stamp for reply.

Send for This
Revised Book
It's FREE

The Book tells you all about the big profits in poultry raising. It tells you how you can get these big profits. It tells the truth in plain English just why some make money and many make failures of the poultry business. It shows you how you can get more eggs and how you can get them when the market price is high.

It tells you how to feed and what to feed. Of all livestock the hen is the most profitable, but she can't lay eggs unless you feed her the right materials to make eggs with. We have, by analysis, found out just what goes to make eggs—just what elements nature demands for egg producing—just how much of each ingredient is necessary—upon this knowledge we make

SURELAY

The Perfect Balanced Egg Food

SURELAY is the one egg producing food that you can depend upon every time to give satisfactory results. We tell you honestly just what we put into it and just how we mix it. Every sack has a guaranty printed on it—What's on the Sack is in the Sack, and That's What's in the Egg.

If you keep chickens, or if you are thinking of going into the poultry business, you should send for

Bean Giant Power Sprayer

The Power Sprayer for Large Orchards. For downright depend-
ability—efficient work—high pressure—ease and economy of opera-
tion—low cost of maintenance—strength—durability—and all
round satisfaction, the Bean Giant is in a class by itself. Supplies
2 to 4 lines of hose and has a capacity of 7 to 12 gallons a minute.
Good for 4 to 8 acres a day.

Thirty years' experience in the building of spray pumps is back
of this outfit.

Built Complete Under One Roof

Every part is produced right here in our own factory—with the exception
of the Novo engine and we use the Novo because we can't build a better
sprayer engine.

TWENTY-ONE DISTINCTIVE FEATURES are incorporated into the
making of the Bean Giant—Patented Pressure Regulator, Porcelain-lined
Cylinders, Rustless Ball Valves, Bean Patented Refiller, Truck with
Rocking Bolster, One-piece Steel Frame, and many others.

We manufacture a complete line of smaller power sprayers and
hand pumps. Before you invest in any kind of a Sprayer, write for

Budding the Walnut

Claud D. Tribble Writes for Cultivator Readers Practical Suggestions Which Will Enable Careful Workmen to Bud Walnuts Successfully.

Consult Illustrations on Cover Page While Reading the Article

SPRING budding the walnut has never been a success with us. Our success has been from the first of July till late in October. The method herein described is the one with which we have had most success after having tried all other methods that we could find, including ring and patch budding.

The first requisite is a knife with a medium weight blade, which must be of the very best metal and kept with a perfectly sharp edge at all times.

An ivory tipped handle is not necessary as all the work is done with the blade.

The next necessity is waxed cloth. This is made from a light stout grade of muslin usually costing about 15 cents per yard. This is filled with the very best grade of beeswax to which is added a very small portion of raw linseed oil. The wax is melted and oil added and stirred, then the cloth is dipped in this, the excess of wax pressed out. Then it is rolled in paper to keep from sticking together.

Community Cooperation

HELPING TO MAKE A PROGRESSIVE TOWN

By R. V. Holland

IF you have children to educate, if you are interested in local social or religious affairs, if you own or expect to own a home or other property in your community, a few minutes thought will convince you that it is decidedly to your best interest to patronize your local stores at all times provided investigation proves that you can do so to as good advantage as elsewhere.

I realize that there is a certain class of merchants—and they are still represented in many towns and cities—who will not handle standard products and who expect buyers to pay exorbitant prices for unknown goods on which they can demand wide margins of profit.

This class of "storekeepers," however, represents a comparatively small minority and is fast going the way of the prehistoric dinosaur and the nearly extinct mossback farmer who "don't have to read nothing about farming."

Villages, towns and communities develop in accordance with the amount and quality of effort put forth by their citizenship, and progressive, right-living people have long since learned that it is neither profitable nor pleasant to live in nonprogressive communities. In nearly every locality are fathers and mothers whose sons and daughters have been forced to leave home in order to secure profitable employment that should have been afforded locally.

If you live on a farm you want good roads, schools, churches, telephone service, mail delivery and a convenient market in which to dispose of your products and from which to supply your wants.

If you live in town you want, in addition to the above, good streets and sidewalks, wholesome amusements, those things that go to make a community worth living in.

These advantages are the natural outcome of, and are limited to, the growth and condition of your locality, which is in turn dependent upon the extent of local trade activities.

Did you ever see a really good town that did not have good stores? The two go hand in hand.

I personally know of an instance within the past year where a very wealthy man refused to locate and establish a modern store in a town of some 3000 population for the reason that an investigation developed the fact that the better class of residents adhered to a long-standing policy, or habit, of doing practically all of their buying in the stores of a nearby city or by mail.

On the face of it this town had merely failed to secure a new store. On the other hand think for a minute what this rich, aggressive man, with the up-to-date store he would have put in, embodying his ideas and methods, would have meant to the community. It would have afforded employment for a number of men and women and would have helped to develop new lines of trade. The owner's personal and business taxes would have meant much within themselves.

Bear in mind the fact that home trading is a most vital element in community welfare and progress. Consider carefully the fact that a portion of every dollar spent in local stores finds its way to some essential function for the support and development of the neighborhood, the general prosperity of which you must necessarily share.

Increased local business means the possibility for securing additional modern public conveniences and luxuries, additional trading, educational, religious and social advantages, consequently, increased individual wealth and opportunity.

Your local merchants are entitled to your patronage provided they offer you the right kind of merchandise at the right price, and you owe it to yourself and your community to extend it to them.

The best beeswax costs about 40 cents per pound, and five and one-half pounds will fill about ten yards of muslin. Making the cloth is rather troublesome as one is not usually prepared to make it and to get all the excess wax from it and it is usually better to buy from those using it in large quantities.

To begin with the bark should separate freely from the stock to be budded, and this stock must be in a good growing condition. The bud stick should also separate the bark freely from the wood, and this can be accomplished by immersing the budsticks in water for a few hours.

A slit is made perpendicularly in the bark of the tree or stock and at the top of this slit a cut is made square across the stock, very similar to the budding of deciduous fruits, except the bark is not raised by the motion of the blade, but is separated by the end of the blade. (No. 1 shows slit in bark.) Next the bud stick is taken in the left hand and beginning about an inch below the bud (see No. 2) cut deeply into the wood to an inch above the bud, cut across the top and with this bud stick in same position insert knife under the edge of the bark and with a turning motion of the budstick remove the bark and cut the bud smoothly between wood and bark then pull off the bud. Should the heart of the bud be broken or pulled out it must not be used as it will not grow. No. 2 shows bud removed from budstick. Next take the outer part of the bud between the thumb and forefinger of the left hand hold directly above the incision in the stock and with the knife in the

right hand, place the end of the blade in the incision and with a slight turning motion open the bark and start the bud, then shove into position by placing ball of the thumb of the left hand directly over the bud. Practice will teach the beginner how to keep from breaking the bud during the insertion. No. 4 shows the bud perfectly inserted. Tear a strip of waxed cloth about 20 inches long and from this tear a strip about a quarter of an inch wide, begin at top of bud, wrap over the cut and downward, leaving the bud exposed but all other parts must be wrapped as nearly air tight as possible. The wrapped bud is shown in No. 5. No. 3 shows the bud taken from budstick. No. 6 the bark of bud started to be removed and is ready for cutting the bud from the wood. Nos. 7, 8, 9 and 10 show budsticks with the kinds of buds to be used to assure success. Buds that are raised above the bark, those with a portion of wood extending from the bark and any wrinkled buds that will not fit perfectly against wood of stock will not grow and should not be used. It is absolutely necessary that all parts of the bud fit perfectly flat against the stock and are so wrapped that it will stay in this position till the union takes place.

We cure all our buds used by cutting off the leaves about ten days before used, leaving two or three inches of the leaf stock, which drops off, leaving a perfectly smooth bud. Buds of last season's growth can be used with success, but usually they are not as easily taken off as the present season's growth. No. 11 shows leaves cut for curing buds.

Packers Must Get Together

J. W. Garthwaite of Corona Has Made Careful Observations of Cooperative Packing House Conditions and Finds Great Diversity of Methods

IN course of the recent agitation among citrus men for some reorganization of present selling methods the suggestion was made that a meeting be called at which members of organizations affiliated with the California Fruit Growers' Exchange might discuss the situation.

While the primary object was to have been the discussion of marketing it seems that such a meeting would be of even greater value in a general discussion of packing house methods and a comparing of notes as to costs, prices received, quality and quantity of work done and, in short, all of the factors making for economy and efficiency.

The writer is led to make this suggestion by the facts discovered by him recently as chairman of a committee appointed to make a comparison of certain cost items in citrus packing houses in Southern California. The directors in one association had planned to use these figures as a guide in fixing salaries and letting certain contracts for the coming year; but when data from 17 houses in different

sections had been tabulated it was decided that because of the unaccountable variations in amounts paid for similar service in different houses they would be useless for that purpose.

While some variation was noted in all departments it was not so marked in the day wages as in the overhead salaries and was particularly apparent in the office; that is, in the salaries of managers, assistant managers, bookkeepers, assistant bookkeepers, stenographers and clerks. It would seem that there should be a certain minimum below which these expenses should not drop and a certain maximum above which they ought not to rise, and between these two they should depend upon the amount of fruit shipped, the curve of expense per carload dropping slightly as the curve of fruit shipped rises. As a matter of fact the office expense per carload in the 17 houses varies from \$5.63 for the lowest to \$20.40 for the highest with no apparent relation between the fluctuations and the amount shipped. The appended chart makes this point clear.

(Continued on Page 280)

Get Your Crop in on Time with a "Creeping Grip" Tractor

WHY let low, wet spots in your field set you back? Your time is limited—your crop must be started without delay if you want maximum yield when harvest time comes.

Here's the tractor that asks no favors of soft, wet ground. It can pull your plows through any ground that's worth working. The creepers do not sink or pack the soil—they cannot slip and lose power. They creep along over the ground, getting a firm grip and giving you maximum traction with the least weight on the soil, least consumption of fuel, and least wear and tear on the power plant.

The machine rides on steel rails on the endless track. The creepers oscillate over rough spots. Thus the power

plant is carried smoothly, free from jolts and vibration. The frame sets up on 3 points of suspension, which eliminates binding on the bearings.

No other power is as well suited for pulling your plows, harrows, seeders and combined harvesters. Let us tell you how you can cut your present cost of doing this work.

Write for Catalog

No other tractor is as carefully built as the "Creeping Grip." We put in it the best materials than can be produced. A demonstration will convince you. In writing please tell us how many acres you operate, so that we can suggest the best size suited for your work.

Exchange Report

Manager G. Harold Powell Presents Report for
Work of the Year Ending September 1st.

(Continued from Last Week)

The California lemon crop increased 132 per cent over the crop of the preceding year. The factors which affect the lemon market differ from those governing the sale of oranges, because the general use of lemons in the summertime depends primarily on climatic conditions. Americans use lemons most freely in cold drinks in hot weather. They use them in a comparatively small way throughout the year for culinary and other general purposes.

Unlike the orange, a low retail price will not greatly stimulate the use of lemons in the summertime. Then temperature is the controlling factor, and if the weather is generally cool, the consumer demand is missing.

The most striking factor in the lemon situation this year has been the abnormally cool weather that has prevailed over the United States since the middle of May. Twice only since the last of April has the average Eastern temperature reached the normal; twice only since the last of May has the Central temperature reached the normal, and at no time since the last of May has the average temperature reached the normal in the Western section of the United States. The wholesale and retail prices of lemons have been unusually low, but neither the jobber or retailer has been able to move the fruit freely because the consumer will not use the lemon as a beverage when the weather is cold.

Other factors besides the cool summer have contributed to the unsatisfactory lemon season. High prices prevailed during the two seasons previous on account of a shortage in the crop, retail prices were high and the use of lemons for culinary and other general purposes, aside from cold drinks, was restricted. When war was declared in 1914, it was generally believed by the trade that imports would be stopped. Wholesale and retail prices rose to abnormal figures in the fall, the trade had no advices of importations and the dealers stocked up for the future with high priced fruit. But imports were not stopped. Italian lemons were shipped here in the usual quantities in the fall. The wholesale price dropped \$3 per box in thirty days but the wholesale and retail trade had large supplies of high-priced foreign and California lemons on hand. These high-priced supplies in the hands of the jobbers and retailers prevented a free distribution of the fruit for many weeks.

The United States has been supplied with the lowest grades of Italian lemons in recent years on account of the usual continental-European markets having been largely cut off by the war. Whenever it was figured that overhead charges could be realized a flood of foreign lemons has resulted. The reduction in the duty of 1 cent per pound in 1912, reduced the overhead charge on foreign fruit 72 cents per box. These factors have resulted in the lowest prices for foreign lemons in New York probably in the history of the importing business. For the year ending June 30, 1910, the average selling price of imported lemons in New York was \$2.90; in 1911, \$3.55; in 1912, \$2.88; in 1913, \$4.38; in 1914, \$3.11, and in 1915, \$2.02 per box. The New York price of foreign lemons

for the fiscal year 1915, which is a leading factor in establishing values throughout the country, is only slightly more than the average cost of producing and placing a box of lemons on the cars in California.

The chaotic condition in the world's lemon trade, the erratic imports, the extremely low prices received for foreign lemons in New York, the cool summer with the resulting lack of consumption, and the general business depression, have been factors beyond the control of the California industry.

In addition to these difficulties the jobbers and retailers have lacked confidence, except in those brands which for years have been handled with skill both in the field and packing house and have thereby established a reputation for keeping quality. At no time in the history of the industry has the advantage of all the details of skillful fruit handling been so strikingly illustrated as in 1915. Some of the California shippers have forwarded their entire crop without loss from decay, with satisfaction to the trade and the consumer and with profit to the producer; while other shippers through lack of equal efficiency in fruit handling have been unable to ship fruit of sound merchandising value or return a profit to the growers.

By-Products Company

The exchange lemon shippers have organized a company to manufacture by-products from the lower grades of fruit. The plant is under construction and the business will be handled on a cooperative basis, the growers receiving the full returns for the by-products after the cost of operation is deducted. From one and one-quarter to one and one-half million dollars worth of lemon oil, citrate of lime and other lemon by-products are imported annually into the United States. These products can be manufactured successfully in California from the lower grades of fruit that are not worth shipping, as well as from fruit that demoralizes the markets because of its inferior quality.

Increasing Consumption of Lemons

There are 20,000 acres of lemons in California four years old or under which will soon come into bearing and will double the supply of domestic lemons. Including the foreign lemons, it will be necessary to increase the lemon consumption in the United States and Canada from 75 to 100 per cent in the next few years. This can only be done by increasing the consumer demand. Production cannot be curtailed because the groves are already planted and the crop can be successfully sold by the grower, the jobber and the retailer only when the consumer demands it. The advertising of Sunkist lemons as a separate campaign from Sunkist orange advertising has been adopted by the board of directors as a basis for the future lemon sales plan. New uses of lemons will be suggested to the public, and the consumer will be educated to the advantages of the lemon as a healthful product, in a greater number of culinary uses, in toilet uses, and in beverages, so that lemons will be used more generally throughout the year. The Sunkist brand will be made synonymous with good lemons in the

minds of the consumers, and that brand will acquire an increasing dominance of the national market through the power of national advertising. The stability of the California lemon industry depends largely on the efforts of the Exchange shippers in increasing the consumer demand. Happily for our growers, the small expense for rational advertising can be added to the cost of marketing and still be lower than the marketing charges of other shippers.

Law Department

The Exchange has a distinct responsibility in its position as one of the largest and most successful cooperative marketing organizations of the United States and in having largely in charge the prosperity and welfare of a great industry. In representing 8000 growers in its business transactions and in its public relationships, its every act must be done without favoritism, without discrimination and with strictest integrity. It must exist as a positive, affirmative force in carrying out the ideals, aspirations and business of its members and must lead rather than follow in its adjustment to public policy. Through the legal department our shippers are fully informed of state and federal legislation, including the provisions of the federal trade commission law, the Clayton act, the food and drug act, and its accompanying departmental regulations, the blue sky law, or investment companies act, and the workmen's compensation act of California, as well as remedial and regulatory legislation in other states.

The Traffic Department

There have been presented to the railroads during the year 11,599 claims, including claims for pilferage, overcharge, and for loss and damage in transit. The claims presented aggregated \$156,506.05. There have been collected and returned to the shippers during the year \$142,004.75. There are practically no old unadjusted claims on the books of the Exchange at the present time, except claims on precooled fruit which are subject to reparation after final consideration by the interstate commerce commission.

Practically all of the loss and damage claims filed during the year are based on freezing in transit. The efforts of the traffic department are directed towards securing better equipment for use in the winter season and such handling as will avoid the loss that results to California from placing on the market inferior fruit frozen in transit.

The traffic department has secured the cooperation of the railroads in the reduction in some of the citrus rates to Northwestern Canadian points, in rates on cull lemons for use in by-product manufacture, on box shock from various Northern California points to citrus territory; and it has cooperated with the Citrus Protective League in securing a more favorable adjustment of demurrage rules and diversion charges proposed by railroads both east and west of Chicago.

Field Department

One year ago the board of directors created a field department. The work of this department has been directed along the following lines: Assisting the associations in improving the methods of fruit handling in the groves and packing houses; improving the equipment and facilities for fruit handling; standardizing the grades and pack, particularly of the advertised brands; increasing and stabilizing the Exchange membership in existing organizations and in developing new associations, cooperating with the Fruit Growers' Supply Company in increasing its usefulness to its members.

Definite progress has been made along all these lines. The field department gave special attention to the de-

cay of navel oranges in February and March. It analyzed the causes of decay and this resulted in an unusual effort by the shippers to overcome the trouble. There was a large amount of scarred fruit in many sections produced by severe winds shortly before the rainy season opened. The frequency of the storms and the length of the rainy season made the proper handling of the fruit difficult and increased the susceptibility of the injured fruit to decay, especially when it was washed. Brown rot was especially prevalent in oranges, and the drying of the washed fruit was difficult with the imperfect drying facilities possessed by the average packing house.

Through the work of the field department, the United States department of agriculture was induced to make a fundamental study of fruit drying with the result that better drying methods are being installed in the packing houses. In addition to better drying processes many vital improvements of a major character will be made in many of the packing houses before the opening of another season.

As a result of the year's work of the field department it is clear that no permanent progress can be made by any association in correcting the details of fruit handling without the proper packing house and field discipline and organization.

Extension of Field Department

During the year the board of directors has recognized the need for greater cooperation between the Exchange and the associations of growers and has enlarged the field department. In the future the central exchange will cooperate with the local associations in making the Sunkist brand still more valuable to our growers. The Exchange recognizes that the strength of the organization depends primarily on the efficiency of the local associations of growers. It has responded to the demand from its members that the central organization cooperate with the local units in building up the highest possible efficiency in fruit handling and in grading.

Fruit Growers' Supply Company

The Fruit Growers' Supply Company has transacted a business of \$3,300,000 for its members. The value of packing house materials supplied the associations will equal approximately \$2,440,000, or \$400,000 in excess of last year, while orchard supplies, on account of the elimination of the oil and orchard heater business, will be correspondingly reduced. The total number of orders handled for the members will show an increase of approximately five per cent over the preceding year, while the operating cost of the supply company will show a slight decrease, the total cost of operation amounting to less than two-thirds of one per cent on each dollar of business transacted.

The amount of material furnished the Exchange members through the supply company may be judged by reference to a few representative articles. It has furnished 12,000,000 boxes, or 2100 carloads of box shock; 16,500 kegs of nails; \$236,675 worth of fertilizers; 1,500,000 pounds of cyanide of sodium; 420,000 pounds of cover crop seed.

Increasing Demand for Oranges and Lemons

The orange and lemon crops of California have increased from five to 20 per cent or more annually for many years; the lemon shipments during the present year are three times as large as two years ago, and twice as large as last year. Population increases on the average two per cent annually, but production continues to increase without reference to demand and without relation to the increase in population. In addition to 20,000 acres of lemons, there are 21,000 acres of Valencia oranges and 43,500 acres of the Washington Navel variety, four years old or under, which, in the next few years, will double the lemon and Valencia crops and increase the Washington Navel shipments.

The problem of the Exchange, therefore, is to create a larger consumer demand and then to increase the efficiency of our sales efforts with the jobbers and retailers so that our oranges and lemons may be widely

distributed and placed in the consumer's hands at reasonable prices. We cannot curtail production. We must sell whatever our growers bring forth. Our sales efforts must be broad enough to move the crop under adverse, as well as under normal conditions. The Exchange, in having the stability of the industry largely in its charge, has no alternative. Through a national campaign of education it must continue its efforts to increase the consumer demand rapidly enough to keep pace with production. If we can increase the consumer demand, the problems of wholesale and retail distribution that confront the industry in California and in Florida, are solvable; if consumer demand is not increased commensurate with increased production, no sales efforts on the part of the Exchange or any other shipper, the jobber or the retailer can move the crop at satisfactory prices.

Advertising of the Exchange

The Exchange is therefore gradually extending consumer advertising as the basis of its future sales plans. It has already obtained tangible results from advertising. The Sunkist brand of oranges and lemons is attaining dominance of the national market. "Sunkist" has become a household word wherever citrus fruits are used; the present satisfactory condition of the Valencia market seems due in part to advertising, and, it is not unlikely that the condition of the citrus industry last winter would have been depressed equally with other fruits and vegetables had not our sales efforts with the jobbers and retailers been strongly supplemented by consumer advertising.

We must not expect advertising, like the magician's wand, to suddenly transform selling conditions. Foods are bought and used largely by habit, and it takes time as well as strong and patient effort, to change culinary or buying habits.

Our advertising policy, therefore, must be firm and consistent, and with a firm and consistent policy we may reasonably expect to accomplish three things:

Increase demand rapidly enough that it may keep pace more evenly with the increasing production. New uses for oranges and lemons can be established; the healthfulness and delicious eating qualities of the products may be emphasized, and the per capita consumption of present users can be materially increased. The latent capacity of 100,000,000 people to consume oranges and lemons is vast, but persistent education is necessary to develop it. This the Exchange must do. No other organization is attempting

Gaviota Fertilizer

It is especially successful for prunes, pears, cherries, apricots and all varieties of grapes.

A Prune Grower Writes:—I cannot recommend Gaviota too highly. Where I have applied it I have the largest crop of prunes that I have ever seen on an orchard.

From a Cherry Man:—I have used Gaviota on my cherry orchard for the last three years—The trees have made a good growth and have produced for three years in succession a large crop of fruit of more than ordinary size and color.

From a Grape Grower:—I used your Gaviota Fertilizer and the results have been very satisfactory. The yield is much heavier and the quality of the grapes greatly superior to anything I ever raised before, and the growth of the vine satisfactory in every way.

We have hundreds of letters similar to these.

We have a sworn statement to the effect that Gaviota Fertilizer increased a grower's yearly profits from \$2500 to \$9528—another that it increased the production of a ranch so that it could be sold at a profit of \$4500.

We want you to learn about Gaviota and how you can increase your yield. So write today for a free copy of our valuable book, "The Care and Feeding of Crops." In order that your trees can produce the best fruit in paying quantities you must properly feed the soil—You cannot take out of the soil what is not in the soil.

To find out just what your soil needs to produce bigger profits, you should take advantage of our free service bureau. Write and let us know exactly the conditions you are working under—send us a sample of the soil, without obligation to you, we will tell you honestly what you should do and what you need to improve your crops.

to meet the future problems of the industry.

Place the market for lemons as well as for oranges more nearly on a year around basis. General uses of lemons can be suggested and the public as well as the trade can be educated to the advantages of the Valencia orange for a summer fruit.

Make our Sunkist brand synonymous with good oranges and lemons in the minds of the consumer and secure for that brand a still greater dominance of the national market than it already possesses.

The advertising policy of the Exchange which is directed towards these three ends will establish orange and lemon merchandizing upon a solid foundation that will mean much for the permanency and prosperity of the industry.

Cooperation with Jobber and Retailer

In addition to our national advertising the Exchange is extending its selling agencies so as to push the fruit out to the consumer wherever new markets can be developed. Our fruit is produced by 8,000 growers. It must be consumed by 100 million people. The channels through which it reaches the consumer are first: The California Fruit Growers' Exchange; second, the railroads; third, the 2500 fruit jobbers who, through 7500 traveling salesmen, are continually pushing the fruit into every outlying district and by other methods of salesmanship; fourth, the 300,000 retail merchants who deliver the fruit to 100,000,000 consumers who are located on the average 2,000 miles away from our growers.

No one of these factors is unimportant in the chain of distribution. The jobbers perform a distinct function in assembling the fruit in the distributing centers, in storing, financing and distributing our product to the retailer; and the retailer pushes it out through countless fruit stands, push carts, grocery stores, chain stores and fruit stores to the consumer. These functions must be performed by someone and the jobber or retailer who dis-

tributes his overhead charge over a group of products can do it more economically than the producer, who would found a wholesale distributing system on a single perishable crop that is variable in supply and condition and subject to climatic disaster. The jobbers are desirable in our distributing chain as long as they present the goods properly to the retailer, at a reasonable margin and under conditions that do not curtail consumption.

The Exchange has investigated and is still studying the fruit jobbing business in every part of the country. It is cooperating with the jobber through dealer helps and in other ways to make the widest possible distribution of our product and to place it in the hands of the retailer at a reasonable overhead cost.

The Exchange is also studying the methods of the retail fruit dealers with a view to developing the widest possible distribution at a reasonable cost for the service performed for the consumer. It is cooperating with the progressive retail dealers through dealer-service work in developing the most attractive methods of displaying fruit before the consumer. These efforts supplement our advertising, and meet with the universal cooperation of the trade. They result in a greater interest in oranges and lemons and an increased demand for the Sunkist brand.

The Exchange cannot perform the function of the jobber or of the retailer as efficiently or as economically as it is now performed. To increase the expense necessary to distribute the citrus fruit crop to 300,000 retailers or to 100,000,000 people and to perform the services which are demanded of each would be destructive to the interests of the grower. The problem of the Exchange is to increase the consumer demand for our product through national publicity, to broaden our national selling agency and to cooperate with the jobbers and retailers so that the demand of the consumer for oranges and lemons may be efficiently and economically served.

WALNUT CULLS DUE TO THE CODLING MOTH

Written for California Cultivator
By J. G. Berneike

FOUR seasons ago my attention was first directed to this new walnut pest of ours when one of our growers reported that he found worms in some of his walnuts. I could then learn of only one or two others who had made a similar find. The following season I watched closely in my own orchard and found a few nuts attacked by worms. The next season, 1914, I found them especially under two trees not adjoining. And this season I find them scattered throughout the orchard and in appreciable numbers. These worms are now known as the larvae of the walnut codling moth.

Mr. Beers has published some observations made on them in Santa Barbara County. To these observations I will add my own.

The eggs seem to be preferably laid at the stem end of the nut, and clusters are preferred, or else the hatching of the eggs proves more favorable here. The larva begins to eat its way through the hull, always working toward the stem end. When it reaches this it eats through the soft stem tissue into the nut, leaving a little hole here which is often the only sign by which a worm infested nut may be known. Most of the nuts however show a black stain on the shell where the larva has been working. This

black stain is probably due to an oxidation of the walnut hull juice, like that which stains the pickers' hands. If such a nut be opened the first thought is: How could such a large larva leave so small a hole? We need only to remember that it was small when it first got in. The damage to the meat at the time of harvesting does not seem to be very great. How much it may increase I am not aware of. In lifting a sound nut and a wormy nut no difference is detected in weight.

To find a clean-cut worm hole through the shell is very rare. If on opening the nut the larva is no longer found, it will be noticed that the hole at the stem end is larger, accommodating the larger grown larva which has made its escape. Growers and packers will realize the difficulty presented in culling when the only sign is the small hole at the stem end. This is large enough to admit the bleaching fluid which will turn the meat rancid and probably kill the larva. Such a nut, if sent to market, will spoil the reputation of California walnuts, whence arises the imperative necessity of doing the most painstaking culling.

What relative this moth is to the codling moth attacking pears and apples others can tell better than I. It does not seem to me, however, that this moth attacking the walnut finds in it its preferred host. It will require further observation to learn more of its habit and how to prevent damage to walnuts. A moth trap might commend itself.

MORE COOPERATION

Written for California Cultivator
By Jay Dutter

At an adjourned meeting of the San Jacinto Valley Deciduous Fruit Growers in Hemet, Saturday evening, September 5, a report of an investigation committee composed of two of the local growers, Messrs. Jay Dutter and Edward Schmidt, great enthusiasm was aroused for the movement that has begun among growers toward the cooperative processing and selling of their produce.

Mr. Dutter and Mr. Schmidt covered over two-thirds of the state on their investigating trip in an automobile and made a thorough study of the problem; a great deal of their investigation was of the working of the California Fruit Growers' Association, with headquarters at Tulare, which is a strictly cooperative association, formed by a number of local canneries purely as selling association patterned along the lines of the citrus and raisin growers' associations, but is mainly for the handling of canned and dried fruits of all kinds.

Their plans are to establish markets throughout the East, or wherever there may be a demand for their product, and distribute it through warehouse men and direct to the retailer; experiments along this line of selling have been made last year with highly satisfactory results and notwithstanding the fact that this is an exceptionally bad year, the results so far have been very promising.

A movement of this kind means that the more members or local canneries are in the organization the greater will be the success. A number of localities over the state who have heard of the workings of this organization are clamoring for admission to the association, and the central office is swamped with requests for the manager to come and organize them and bring them into the fold, and this is

being done as rapidly as possible with the busy season of packing on and the markets to look after.

The Hemet and San Jacinto Valley growers, after the report of the committee, appointed a committee of seven members to solicit subscriptions for membership, and organization will be effected as rapidly as possible in the hope that the association will be able to handle some of the olive crop this fall.

It is certainly time that the grower of fruit in California realized the full benefits of his labor. The disastrous prices received this year have awakened him to the fact that the grower himself is the only one who is capable of going out and establishing a market and placing his products on the market at a price which the consumer can afford to take for his whole crop rather than to take a small part of it at a high price, of which the grower gets little and has to let the rest rot on the ground for lack of selling facilities or lack of a way to handle or market it.

If the growers are wise they will give this matter immediate attention and get into the van of this movement and secure the benefits of co-operation. Some of the best financiers on the coast have endorsed and emphasized the need of this work and state that with the enormous acreage coming into bearing soon this is the only solution of the market problem; and the banker knows, as he has made a study of it and loans the money to handle the crop.

A FAIR FOR FARMERS

Right along the line of one of the "Agricultural Notes" in the California Cultivator of August 26, "Fairs for Farmers, Not Fakers," I believe you'll be interested to know that the management of the Riverside District Fair is working out a genuine educational program.

We agree that a certain amount of pleasure and a diversity of recreation is necessary, and with this end in view the very best of amusement features have been contracted for. But of paramount importance to the ranchers of Southern California are the demonstrations and practical talks which are being arranged for each forenoon of the fair week, October 5 to 9. Experts from the state agricultural college and men of practical experience will appear on the most novel and really worth-while program ever incorporated in the events of an agricultural fair. Details regarding the subjects to be presented and the men who will bring to the ranchers of the Southland the best methods and keenest ideas of modern farming will be announced within ten days or two weeks.

MILLIONS FROM WALNUTS

Many a nut sundae in ice cream parlors and at the soda fountains throughout the length and breadth of the land is eaten with a greater relish by reason of the fact that English walnuts form an important part of the attractive refreshment. It is also safe to say that many who enjoy the nuts will not know that they have probably crossed the continent in order to be included in the concoction. California, however, in addition to its many other products, is in the front ranks as a producer of English walnuts. In fact this crop runs annually in the neighborhood of 20 to 25 million pounds in the Golden State alone, and of this immense amount one county, Orange, produces some 40 per cent. One of the principal walnut-producing countries abroad is France, and when the crop there fails the price of the American-grown product naturally advances.

A most careful selection of soil and climatic conditions is necessary on the part of the walnut grower. The trees require a deep, rich soil, and the cli-

mate must not be too hot nor too wet. For this reason the walnut-producing area is comparatively limited, both in this country and Europe.

Before walnuts reach the market they go through a most careful process of sorting and drying, after being brought from the orchards, and those which are to be bleached have to receive especially close attention, as a variation of even one cent a pound on a large output would mean a difference of hundreds of dollars in the total income of the orchard owner. An orchard may produce higher than a ton of walnuts to the acre, and a careless overseer might entail serious loss on his employer by neglecting the crop during its drying period. Some orchards in California have been known to render an income of \$350 an acre. In exceptionally good orchards one can sometimes see single twigs with eight to ten fully developed walnuts on them.

California now sends walnuts to every state in the Union, and that this one crop is a most important one can easily be figured by computing the value of its output at prices ranging from 14 to 18 cents a pound, bringing its money value to three or four million dollars a year.

Walnuts are gathered during September and October, generally, but it is some months later before the packing houses are cleared of them. Many a Christmas stocking will undoubtedly have some of the California walnuts to augment the striped candy canes, the jumping-jacks and the dolls.—Allen Henry Wright in the International Confectioner (New York.)

Make your arrangements now for the fall garden. Select the land and keep it in excellent condition till planting time. By doing this you may make it a reservoir to store moisture for the use of plants later on. The secret of success with a fall garden is early and satisfactory preparation.

Farm Bureaus

Alameda County, C. W. Rubel, Adviser, Hayward

Irvington, Tuesday, September 21.
Centerville, Friday, September 24.
Newark, Monday, September 27.
Niles, Wednesday, September 29.

The farm bureau is still laying stress upon the use of cover crops in the orchards, especially in the southern end of the county. Common vetch has in general proven the most satisfactory, and several orchards will put in demonstrations using vetch this fall. Some that can be irrigated will be sown early this month.

The farm bureau is also taking up the use of lime and is arranging to secure sugar house lime from the Alameda Sugar plant at Alvarado and distribute it to the various parts of the county.

The Livermore Center is arranging for a Land Products Show together with a poultry show and a horse show to be held on Saturday, October 9. A great deal of interest is being shown in this scheme to demonstrate the productivity of the Livermore Valley.

Solano County, J. W. Mills, Adviser, Fairfield

The meetings of the Solano County farm bureau will take place as follows:

Cordelia, September 16.
Vacaville, September 21.
Dixon, September 23.
Benicia, September 28.

There will be no meeting at Rio Vista this month except as the local Rio Vista farm bureau unit may call after the celebration on the 9th.

Napa County

The Napa-Sonoma Cow-Testing Association, with more than 900 cows signed up, will commence work September 15. The herds in this association are located in three counties but they are all within 25 miles of Napa. One hundred and seventy are located in Solano County, near Vallejo, 300 in the Sonoma Valley and adjoining hills and the remainder in the Napa Valley. Of the total number 370 are in herds selling whole milk.

A new line of work is being undertaken in this association. During the first month, September 15 to October 15, the tester will test such herds as wish it for tuberculosis by the intradermal method, in place of the regular butterfat and milk test. The whole purpose of this part of the work is to acquaint the dairyman with the tuberculosis test that he may take measures to eliminate the disease. The owners of several hundred cows have already indicated their purpose of taking advantage of this opportunity. The only additional cost will be the wholesale price of the tuberculin.

The feeding conditions in this territory are exceedingly varied, running from home-grown alfalfa hay and corn silage in the valley to nothing but range on the hills with almost continuous concentrated feeding. Some dairymen make grain hay the basis of their winter feeding, others alfalfa.

The butterfat records will doubtless show what is now the most profitable feeding practice for these different conditions.

Mr. Hugh Assetstin of Humboldt County, a graduate of the farm school at Davis, and formerly engaged in official testing has been chosen as tester for the coming year.—Paul J. Dougherty, Assistant Farm Adviser.

Arizona Farm Improvement Association

Increased activities in all parts of the state among the farmers marked the past month. This condition of affairs promises to be still further accelerated by the appointment of two or three new farm advisers to be placed in different parts of the state.

Local F. I. A. No. 21 has been recently organized at Mesa. The officers of this association are: Elijah Allen, President; W. W. Carney, Vice President; Bert Wingar, Secretary-Treasurer.

At Douglas on August 27 the Cochise-Santa Cruz County Farm Improvement Association was organized. Temporary officers were elected: B. O. Payne, Chairman, and Guy B. Sisson, San Simon, Secretary. The next meeting of the advisory council of this association will be held at Cochise on September 18, when constitution and by-laws will be adopted and permanent officers elected.

The F. I. A. at Casa Grande is starting a movement in cooperation with the other F. I. A.'s in the valley to purchase a carload of wire fence, and is considering the establishment of a cooperative store.

The Gadsden F. I. A. is making plans for the starting of a cannery.

Whitewater, Webb, Bisbee—The Farmers' Societies of Equity which affiliate with the A. F. I. A. are shipping a carload of melons and other vegetables to Douglas and Bisbee daily.

Wellton.—The F. I. A. is planning to buy a first-class stallion some time in the near future.

Plans are on foot for the second annual San Simon Fair. The other day the members of the F. I. A. turned out and spent two days repairing one of the main roads.

The secretary suggests that it would be an excellent plan for each local F. I. A. to prepare an exhibit to send to the state fair to be shown as its own exhibit, properly labeled.

Maricopa County, Arizona, James A. Armstrong, Adviser, Phoenix

Pendergast School District, Thursday, September 16, 8 P. M., Livestock Specialist C. W. Barnes of the University of Arizona will be present to give an address on calf feeding. Prof. S. F. Morse may be present and Farm Adviser J. A. Armstrong will tell how to make alfalfa grow during the hot weather.

Higley Board of Trade, Friday, September 7, 8 P. M. The subject will be, exhibits for the state fair, and the growing of small grains under dry farming conditions. A report on bird control is expected. Suggested treatments by the farm adviser are now being tried.

Laveen Literary Society, Friday, September 24, 8 P. M., Farm Adviser Armstrong will tell why alfalfa does not grow well in August and September and what to do about it.

"AVOCADO-AHUACATE"

By Henry S. Gane, Santa Barbara

The article, "Avocado-Ahuacate," by Mr. Hart, in your issue of August 26, contains, to me, a most surprising statement, "So far as our experience has shown we are producing a fruit superior to that of Florida," and further, "if the California growers persist it will not be long before the name ahuate will mean an unusually good alligator pear and the name avocado a second class product."

In a recent six months' sojourn in Florida after an absence of 13 years in California it was with much interest that the writer compared Florida fruit with California, as well as the methods of growing and marketing the same. The one most striking feature was the great superiority of the Florida avocado over the California ahuate. Alligator pears are preferred by me over all other things to eat, and I rarely ever neglect an opportunity to procure them. Of course my personal taste may be at fault, but I am absolutely positive that nine people in ten would much prefer this fruit as offered for sale over a large area of Florida during, say, the fall of the year, over that offered for sale to the public in California. I cannot of course state that California does not or cannot raise fruit equal to that of Florida, merely that I have never seen it offered for sale. The retail price in Florida over a number of months and a large territory was uniformly ten cents a piece.

As far as using the term ahuate as a trademark is concerned, with the idea expressed by Mr. Hart, I would mildly suggest that it might prove a boomerang, and in educating the public to its use we might begin with the "Cultivator," for in the very issue mentioned the Los Angeles market quotations are given under the "provincial" term of avocado.

* * *

We believe Mr. Hart's reasons for writing as he did regarding the Florida fruit is that analyses which were made of such Florida samples as could be secured ran exceedingly low in oils and nutrients. These analyses appear in Bulletin 254, recently issued by the state university, and were made by Professor Jaffa.—Editor.

Get Under Your Plow Sole and Raise Your Profits

FIELDS, truck gardens and orchards are often underlaid with a plow sole as a result of long cultivation. This hard packed soil is practically impervious to moisture and impenetrable to roots.

Formerly it was necessary to fertilize such land heavily every year—a method of cultivation entailing considerable waste in money and effort. Why? Because the hard stratum caused much of the valuable fertilized top soil to be lost by erosion.

Today without this expense, without this waste, bigger, better and more profitable crops are being produced by means of

HERCULES DYNAMITE

With its aid the rich virgin plant food four feet below the plow cut is being utilized, the drainage of the soil is being improved, crops are being protected against drought and floods.

Hercules Dynamite is doing these things quickly, easily and economically. But subsoiling is only one of the many uses of this great agricultural power. It is saving time, labor and money in planting trees, draining land, removing rocks, blasting stumps, digging ditches, excavating cellars, cisterns, etc.

You can do the work yourself without difficulty even if you've had no previous experience. There is a Hercules blaster near you, however, who will do the work for you at a small cost. We shall be glad to send you his name on request.

If you want to know the many ways in which Hercules Dynamite can lessen your work and increase your profits

GET OUR VALUABLE FREE BOOK.

We have just issued a revised edition of *Progressive Cultivation*. Whether your farm is large or small you cannot afford to miss reading this interesting book. To every reader of this magazine we offer a copy without cost or obligation. Write for yours today.

Questions and Answers

THE EDITOR

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Softening Water

I have recently moved to this place and have a new well with a good supply of water which I find is extremely hard. What may I use to soften for household or laundry purposes?—Subscriber, Concord.

Hardness, the property of water which causes it to form an insoluble curd with soap rather than give a frothy lather, is due largely to the presence of lime and magnesia, usually in the form of bicarbonates and sulphates. To express it technically, water having more than 250 parts per million of hardness producing constituents is inconvenient for washing purposes although much harder waters may be used for drinking. These injurious substances may be eliminated or neutralized by the addition of soda ash or carbonate of soda, about one pound of soda ash of 78 per cent strength or one and a half pounds of 56 per cent strength are required to each 1000 gallons of water. In addition borax is used to a large extent for this purpose and it is to be preferred for toilet purposes because it has a less injurious effect upon the skin. One or two tablespoons in the bath is usually sufficient. In addition it is suggested that the juice of a lemon to the bath water will neutralize these injurious substances.

Garden Questions

I would like to obtain some information on a few subjects pertaining to the floral and fruit departments of gardening. You gave me a great deal of aid on other things in the past.

I have a gravel driveway that is not in use now and decided to plant flowers in it. Had it plowed up and hauled a quantity of fertilizer, planting the driveway full of Shasta daisies. This year the daisies blossomed abundantly for a few weeks, then grew small, finally ceased blooming. The ground is kept well watered and cultivated, yet it will bake hard in spite of all, on account of so much gravel. As the daisy bed now presents a forlorn appearance, I wondered if I could not plant a succession of blossoming plants as follows: One row of calla lilies for spring blossoms, a row of daisies and a row of the beautiful red and golden lilies that blossom later in the summer, alternating the rows until the entire bed is taken up. Yet I do not know whether the lilies will thrive in this bed. I would appreciate any suggestions for an ever blossoming bed, also if you can tell me how to treat the gravel bed in order to prevent the baked surface. One cannot cultivate every day, yet this must be done in order to keep the plants flourishing.

I am obliged to move some four-year-old roses. At what time of the year shall I move them? Shall I prune them first? Will the moving interfere with the spring blossoms? When is the best time to prune roses?—Subscriber, Alhambra.

Four-year-old roses that are to be moved should be left entirely without water for at least two months before moving; three would be better still. Prune at time of moving and move with bare roots but shift them quickly and water as soon as replanted. If they are already partially dried from lack of water they may be moved at any time now. The moving will not interfere with spring bloom; on the

contrary they will bloom all the better for it. The best time to prune roses is a long and complex story as so much depends on treatment, also the pruning is governed by time of first heavy rains. We will publish something on the subject soon. The pruning season as a whole ranges from September to March.

Your scheme for flower bed will be fairly successful. It will not do for another to arbitrarily outline a succession for it would contain probably, flowers you would not like. Plant as you propose and study the problem if a gap occurs in the succession of blooms. After planting mulch well with stable manure and do not cultivate. No baked surface is then possible.

Percentage of Eggs

Will you kindly give me the proper percentage of eggs per day to expect from Leghorn hens under normal conditions with proper feed during their different laying years?—Subscriber, Santa Ana.

I do not know that such a table has ever been worked out and it has cer-

tainly not been worked out for California conditions. Tables of average egg yield for the various months have been made at the Maine, Kansas, Arkansas and Australian experiment stations, but they seem to be for the first year only. That of the Australian station, where the climate most nearly resembles that of California, is as follows: January 51 per cent, February 66, March 67, April 61, May 53, June 45, July 43, August 41, September 29, October 31, November 31, December 40. Probably these figures would be a little high for California, for Australian hens are exceptional layers, and the conditions surrounding them at the egg-laying contests were extremely favorable.

That it would be very difficult to arrive at satisfactory averages for hens in their second and third year is shown by the record made by four hens at the Cornell station. Lady Cornell, the best layer of the four, laid 257 eggs in her first year, 200 in her second and 191 in her third. Madam Cornell laid 245 in her first year, 131 in her second and 163 in her third. Cornell Surprise laid 180 in her first, 186 in her second and 196 in her third. Cornell Supreme laid 242 in her first, 198 in her second and 220 in her third. The surprising thing is that three of these hens actually laid more eggs in their third year than in their second, and one laid more in the third year than in the first. As long as it re-

mains the custom to trapnest hens only in their first year we shall not know much about the laying of old hens. We do know, however, that many Leghorns lay nearly as well the second year as they do the first and (Continued on Page 283)

Books

This list is prepared with the purpose of enabling our Cultivator readers to supply themselves with standard books at lowest possible prices. We call especial attention to a few of the new publications. "Citrus Fruits" by Professor Coit, of the University of California, covers all phases of the Citrus Industry under California conditions—the kind of a book we have had many calls for but never before been able to supply. "Productive Feeding of Farm Animals" by Woll, will command special attention. "Poultry for Profit" (The Cultivator Poultry Book) by Koethen, another California book, is new and excellent, telling what to do and what not to do with poultry in California; a sure guide to poultry success. The new Standard Encyclopedia of Horticulture, by Bailey, is not equalled by anything of the kind which has ever been published at any time in any language. Special terms of payment and discounts are offered by the publishers through us on this Encyclopedia. Write us about it.

General Agriculture

SEED POTATOES

By W. V. Shear, United States Department of Agriculture, Before State Fruit Growers' Convention

DURING the past decade a gradually increasing emphasis has been placed upon the importance of good farm seeds of all kinds. Improved strains of wheat, oats, barley, corn, alfalfa and other farm crops have been produced. Not only is the particular strain considered of great importance, but also the vitality and powers of germination are tested. Where formerly much emphasis was placed upon cultural methods and ways and means for the destruction of weeds and other crop pests, the thought of the farmer is being directed more strongly toward the production and use of better seed. And justly so. In the chain of factors which go to produce a large crop of any kind the factor of good seed can hardly be overestimated. Practically as much expense is put into the plowing, harrowing, cultivating, irrigating, hoeing and harvesting a three quarter or 50 per cent stand of any crop as for a full stand; and often this low percentage of stand is due to poor seed and the same expenditure might have produced a 25 or 50 per cent greater crop had the proper kind of seed been used.

In the case of the potato these conditions are all the stronger because of the great expense connected with the care of the growing crop and its harvesting. Good seed potatoes, then, comprise one very important factor without which success in potato growing cannot be secured. But how shall we define good seed potatoes and how can they be distinguished from other potatoes. The final test of good seed potatoes is the quantity of marketable tubers they will produce when given the proper attention. That may, perhaps, seem self-evident, but it is the point of view which is sometimes lost from sight in examining seed potatoes and some one characteristic of good seed potatoes obscures this final test. Let us not forget, then, that good seed potatoes are productive potatoes. What the grower wants to know, however, is the way in which good seed potatoes can be distinguished from poor ones, either when he goes to market to purchase his supply or when he selects them from his own crop. But do not jump to the conclusion immediately that the writer is going to tell you in the next sentence just how this may be done because he believes it is impossible to determine absolutely from the examination of a potato whether it will be productive when planted. Usually, under our present market conditions, the only criterion by which you can judge whether you have used good seed potatoes is the fact that, when the soil is thoroughly fitted and the plants given good care throughout the season, at harvest time you find you have a crop which equals the best that has been produced in your locality.

However, the writer does not wish to have you infer that the examination of seed potato stock has no value, or even little value. The examination of seed potatoes is largely a matter of the elimination of the unfit rather than a determination of the fit.

HORSE BEANS SOUND

Investigations have shown that there are large quantities of horse beans being shipped into interstate commerce for food purposes and that some of these horse beans are wormy or weevil infested. Such wormy or weevil infested beans are unfit for food purposes. The department of agriculture, therefore, is serving notice that the shipment of such products into interstate commerce is in violation of the food and drugs act.

Wormy beans become infested while growing on the vines. Eggs are laid on the small green pods, and the larvae hatched from the eggs burrow into the beans where they slowly develop. The wormy beans can be readily detected and there is no excuse for selling them for food purposes.

EFFECT OF POLLENIZING ON FRUIT

DOES the planting of cucumbers near melons cause inferior fruit? That is, does the pollen of the cucumbers in fertilizing the flower of the cantaloupe or other similar plant also change the quality of the same year's fruit. Of course it does destroy the seed for next year's crop and in addition a few growers will not plant these crops near each other for fear of inferior fruit. Most market producers, however, pay no attention to this. The question now comes "Is there really any difference?" "Principles of Breeding" by Davenport Says:

"Effect of crossing upon fruit in general. What the layman calls fruit is commonly not the endosperm that has been under discussion but the thickened and much developed fleshy receptacle on which the seeds are borne. It has been claimed that these parts are directly influenced the first year by crossing, so that the character of strawberries, apples, pears, melons, squashes, etc., depends much upon the source of the pollen used in fertilization.

"This claim has never been well substantiated by direct experiment. Dr. Burrill of the University of Illinois tells me that he crossed Crescent strawberries both with the Sharpless and with a wild berry especially selected for its insignificant, worthless fruit. Nobody was able to detect the difference in the resulting crops. So far as known to the writer the same principle holds in other fruits. It is the endosperm and not the receptacle that is directly affected by fertilization, and any influence upon the latter must be indirect and comparatively slight.

Though the receptacle is not itself fertilized, its development is conditioned upon that of its superincumbent seeds, which are themselves directly dependent upon fertilization for their development.

"This fleshy growth of the receptacle is, therefore, the result of a kind of stimulus from the growing germ, and it is conceivable that this stimulus may differ somewhat in degree, depending upon the source of the pollen. In this way the size of the fruit might be indirectly influenced by the pollen; and in fruits like the pear, which are not concentric about the seeds, even the shape might be influenced in the manner noted."

Better than that, however, is the fact that we can turn to an authority in our own state, Dr. Herbert J. Weber, who has spent much of his life in studying matters of this nature. We asked a statement from him. He writes:

"With reference to the effect of cucumber and squash pollen on melons and cantaloupes when planted near to the latter:—

"According to your letter I understand that it has been claimed that there is an effect on the fruit of the same year, that is, a current or immediate affect from the pollen. I would state that the evidence on this point

is pretty strongly against their being any effect. At one time it was thought that there certainly was such an effect in certain cases, this belief being derived primarily from such cases as the change of color in the endosperm of corn and various grains, as well as peas. However, we have come to understand this result clearly and find that it is due to the fact that in corn, for instance, the endosperm, which makes up the greater part of the interior of the corn seed, is material that is developed inside of the embryo sack but

is distinct from the embryo, developing from the egg-cell. It has been discovered in a considerable number of plants, corn among the rest, that we have a process now known as double fecundation. There are normally two male cells developed in the pollen tube, and one of these cells normally fecundates the egg cell proper from which the embryo develops. The second male cell in certain cases has been found to unite with the so-called endosperm nucleus, causing a secondary fecundation, and from this secondary fecundation the tissue of the endosperm develops. In corn, therefore, not only is the embryo following the cross a hybrid, but this endosperm, which forms all of the interior part of the seed, is also hybrid and shows the effect of the hybridization. The belief in the immediate effect of pollen was based on such cases as corn. In peas, where all of the interior of the seed is the new embryo, of course there is an effect from the cross shown in the embryo itself.

Taking the case of melon-like

fruits, there is no development of this kind as the embryo is confined inside of the seeds in the interior of the fruit. It is only this small embryo that would be affected by the hybridization, and I know of no experimental research that shows the influence as passing out and affecting the portion of the fruit that is eaten. I do not, therefore, believe that there is any danger to the corn of a certain season from planting cucumbers and squashes or pumpkins near watermelons and cantaloupes.

"Again, we know that there is very little crossing of these different varieties in nature, so that even if the seeds were used from such melons for planting, there would not likely be very much effect the following year. We would, however, expect some effect in the following year from such planting, due to crossing accidentally.

"If one uses well-selected seeds of cantaloupes or melons known to be pure strains, I do not believe that any effect would be observed in the crop following from the planting of squashes or cucumbers near them."

Paints at \$1.50 Gallon

—You can buy paints cheaper from us than any other dealer in the West. We buy in large quantities and sell for the lowest prices.

—Standard House and Floor Paints, \$1.50 per gallon.

—Standard makes of Varnishes at 25% off regular prices.

Everything in Paints, Wall Tints, Brushes, etc., at big savings to you.

—Dutch Kalsomine 4½¢ per lb.
—Black Graphite Roof—per gal. 50¢
—Standard Roof Paints—red, green, gray—per gal. 85¢
—Shingle Stain, made from pure ground colors—per gal. 50¢

\$15 to \$18 Front Doors \$10 Veneered Oak with Plate Glass

—A typical value from our Sash and Door Dept., finest quality veneered oak doors with plate glass panels at top. Secured by special purchases recently and not mentioned in our catalog. All standard sizes and styles. Write for further details.

Screen Doors 25% Off

—New screen doors, the overstock of a famous door factory, made of best selected sugar pine in standard stock sizes. These doors can be duplicated in any first class yard at 25% to 40% more.

Style No. 8, \$1.25

—This door usually sells for \$1.65. Made of clear sugar pine and fitted with black screen wire, at our price. \$1.25

Style No. 9, \$1.40

—Made of sugar pine, with three lower panels and fitted with galvanized screen wire. A door that will stand lots of use; our price. \$1.40

Odd Doors \$1 and \$1.25

—Inside doors of best sugar pine, 5 panel Colonial and 5 panel O. G., styles a big lot of them, in all sizes.

\$30 Wallboard for \$19

—The highest grade wallboard on the market; made of 3 layers of moisture-proof fibre, with asphaltum between each layer; or cream white fiber board.
—Cheaper and neater than plaster or lumber, and anyone can install it in one-quarter of the time. Per 1000 square feet. \$19.00

"Standard" Roofing Paper

—A splendid quality of roofing paper that most firms would sell 20 to 40 per cent higher. Each roll complete with necessary cement, nails, etc., ready to lay.

1-ply, double-sanded, per roll of 108 square feet. \$1.15
2-ply, double-sanded, per roll of 108 square feet. \$1.40
3-ply, double-sanded, per roll of 108 square feet. \$1.65
1-ply, "King" smooth, per roll of 108 square feet. \$1.25
2-ply, "King" smooth, per roll of 108 square feet. \$1.50
3-ply, "King" smooth, per roll of 108 square feet. \$1.75

—Send for free sample. Remember we ship direct to you.

SHOVELS!—At Wholesale Cost—SHOVELS!

—You may go a life time before you get such an opportunity again. These shovels are in A-1 order but have been slightly smoked by fire while in transit.

—Every one in perfect working condition, all styles and sizes; note the prices:

Long Handle, Round Point Shovels, per dozen. \$4.85 or 50¢ each
Long Handle, Square Point Shovels, per dozen. \$4.85 or 50¢ each
D Handle, Round Point Shovels, per dozen. \$4.15 or 50¢ each
D Handle, Square Point Shovels, per dozen. \$4.15 or 50¢ each
Long Handle Spades, per dozen. \$3.75 or 40¢ each
D Handle Spades, per dozen. \$3.75 or 40¢ each
Long Handle Scoops, per dozen. \$3.75 or 40¢ each
D Handle Scoops, per dozen. \$3.50 or 40¢ each

Dana Freezers at Half

—A big lot of Dana freezers. Send in your order today. We've sold hundreds of them at these prices and have yet to hear a single complaint.

3-quart size, regular \$2.25, now. \$1.00
4-quart size, regular \$2.50, now. \$1.25

This Special Steel Enamelled Bath Tub \$8

—One of the greatest bargains we ever offered! Made of best galvanized 21 gauge steel. Outside is finished in a rich sky blue enamel with bronze trimmings and hardwood edge. Price only \$8.
—Other larger sizes at \$8.50, \$9 and \$10.

Low Down Enamel Steel Toilet Combination. \$11.50
Complete to floor—wonderful value
Low Down Vitreous China Closet Combination. \$15.50
Special value—worth \$22.50.
Big value in High Tank Toilet Combinations. \$10.00
Complete to floor—a bargain.
Special Bankrupt Stock of Kitchen Sinks. All sizes up from. \$1.00
Best Quality Porcelain Lavatories; every one guaranteed—\$3.75
\$10 down to.

Oregon Pine \$10 to \$15

—Good new rough Oregon Pine lumber, all sizes, at \$10 to \$15 per thousand.

—Oregon Pine lath, 4 ft., new, \$2.50 per thousand.

—Best grade Slashed Grain Oregon Pine, sanded finish, \$37.50 per thousand. This makes a beautiful interior finish.

—These prices will give you an idea of how our lumber department can save you money. Send in your lists and let us give you our price delivered.

Building, Chicago, Ill.
S. E. Leith, Fifth Avenue
Building, New York.
C. A. Cour, Globe Bldg.,
St. Louis, Mo.

Entered at the Post Office at Los An-
geles, California, as Second-Class Matter.**Thursday, Sept. 16, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**POST OFFICE INSPECTION**Inspectors of the state agricul-
tural department of the state of
Washington have been refused access
to parcel post shipments of fruit or
plants. The attorney general of that
state has given it as his opinion that
it will be impossible for the inspect-
ors to open packages unless before
shipment or after delivery.**KEEP THE TEETH BRIGHT**California Cultivator,
Los Angeles.

Gentlemen:

Your new gown is fine and enhances
our appreciation of an already splen-
did rural journal. It is the only im-
provement we could have suggested.
May your "teeth" be ever bright and
sharp. Yours sincerely,

Ernest L. Owen, San Diego.

We appreciate the hearty commen-
dation, especially the suggestion that
the Cultivator's teeth be ever bright
and sharp. In this particular though
we feel justified in reminding Mr.
Owen and all of our readers that
while it is up to the manufacturers of
the Cultivator to send it out with
teeth well sharpened, the keeping of
them bright depends upon use.**SUN-MAID SPECIAL**The Associated Raisin Company
is attracting no little attention in the
commercial world. It is doing things
in a way which brings publicity to
California in general and money for
the raisin grower in particular. The
wine men refused to buy low-grade
raisin grapes to make up into brandy,
so the association, to take them out
of the raisin market, is now buying
them up.

Another big feature recently pulled

off was the Sun-Maid Special of 42
cars of raisins which was sent out of
Fresno recently, making record time
through to Chicago. It went out with
flying banners and at every town it
passed in daylight was given a royal
reception.**PASSING THE WORD**In the heading of one of last
week's editorials we asked if our read-
ers did not like us better, especially
as to the new material of which our
dress is made. "We have received
definite answer from our patrons;
they do. Our better paper has caused
much favorable comment and our in-
vitation to subscribers to join in the
effort to make the paper a greater
power has been answered affirmatively.
These hearty words of commendation
and good will are inspiring to
greater effort. We have some good
things coming that are entirely in
keeping with our finer appearance, for
the suggestions requested are coming
in and we are going to accept them
just so far as lies in our power.**BIG CROPS**Reports from the department of
agriculture show crops this year to
run five and a half per cent above
the ten-year average. Peaches lead.
This fruit runs, compared to the aver-
age, 144.2 per cent. Spring wheat
also is a long crop, 123.2 per cent.
Barley is 118 per cent; apples, 117;
kaffir corn, 114; potatoes, 108.2; al-
falfa, 106.5. Grapes are slightly un-
der the average, or 98 per cent. To-
matoes, hops, oranges, rice, etc., are
about the same percentage.California's general average of all
crops is slightly above average, or
107.7 per cent.The total production of important
products this year compared with last
year is estimated as follows: Corn,
111.7 percent; wheat, 110.1 percent;
oats, 123.4 percent; barley, 114.4 per-
cent; rye, 103.3 percent; buckwheat,
105.9 percent; white potatoes, 100
per cent; sweet potatoes, 114 percent;
tobacco, 108.2 percent; flaxseed, 112.5
percent; rice, 108.3 percent; hay (all
tame), 115.6 percent; clover hay, 134.6
percent; cotton, 74.5 percent; apples,
84.6 percent; peaches, 118.5 percent;
pears, 91.7 percent.**OVERHEAD EXPENSE**There is a fund of information
or rather inspiration in the article on
the third page of this issue. Mr.
Garthwaite has been studying the
marketing side of the orange industry,
or perhaps more properly the packing
house side, with particular reference
to overhead expense. Many growers
of Washington navel oranges have
found this year's returns unsatisfac-
tory. The expense of growing the
crop has been far from small. Some
have claimed that in some packing
houses not sufficient attention has
been paid to this matter of overhead
expense. This is entirely in the hands
of the growers and they are insisting
that attention be given to excessive
salaries. Ability must be paid for,
but we believe Mr. Garthwaite's sug-
gestion for a conference of those in-
terested is a most valuable one and
we trust will be carried out. In a per-
sonal letter Mr. Garthwaite writes:
"It seems that at present the only
meetings that draw crowds are the
ones that are called to kick about
something." If this conference is
called it should be not of the kicking
but of the constructive kind.**MARKETING TROUBLES**"The unparalleled glut in the
Eastern produce markets has spread
discouragement among hundreds of
vegetable growers. Marketmen have
not been able to keep the big receipts
moving nor to keep the retail prices
low enough to stimulate consumption
sufficiently to take care of the sur-
plus. In Philadelphia as well as in
other large Eastern cities thousands
of tons of perfectly good foodstuffs
have been wasted, and larger quanti-
ties have been left to rot in the field,
as the market prices would not pay
the cost of harvesting and shipping."The above from the Country Gen-
tleman is but a sample of many simi-
lar remarks found in the Eastern farm
papers. It is used only to show to
our California producers who are
somewhat discouraged with this year's
conditions that they are not alone in
meeting a serious marketing problem.
It also shows that there must be more
oneness of purpose in our marketing
system. Farmers are competing with
each other and of necessity will con-
tinue to do so, but they need not con-
tinue to the degree they have during
past years. They must get together
and secure more even distribution.It has been the Cultivator's plea
for years that we might have more at-
tention given to the marketing ques-
tion. This is a big question and one
that calls for our best effort. Only
recently the department of agricul-
ture has taken up this phase of farm
life. Our state university and other
institutions are also joining in the ef-
fort to solve it. The greatest step in
that direction is the education of the
farmer himself. It takes the highest
intelligence for cooperative effort.
The more we study the closer together
we get.**THE NEWLANDS BILL**The Inland Waterways Associa-
tion met in Los Angeles last week and
much interest was shown in the ques-
tion of endorsing the Newlands Bill.
Opinion was divided as between en-
dorsing the bill and endorsing the
principles on which the bill is found-
ed.To the layman this seems like a
splitting of hairs, but President Dock-
weiler fought for the endorsement of
the principles because of certain de-
fects in the details of the bill as it
has been presented. George Max-
well, on the other hand, was a con-
sistent fighter for the full endorse-
ment. He admitted that there were
errors in the construction of the bill,
but contended that they were errors
in details, not in fundamentals. He
affirmed that the easiest way to damn
the whole proposition was to endorse
the principles. He said that the de-
fects of the bill could later be worked
out and that at the recent meeting at
New Orleans large interests did their
best to discourage the bill, but their
effort failed and the congress fully
endorsed it.The supporters of the bill won a
signal victory and the Los Angeles
meeting also fully endorsed it.This bill gives the federal govern-
ment authority to initiate, and money
necessary to carry out, plans for the
control of stream freshets, the use of
surplus waters in the promotion of
agriculture, power, and other develop-
ments, and furthering of navigation
interests in the eight districts. For
the California-Pacific division the ap-
propriation is \$50,000,000 and for the
Colorado River division a similar
amount. The Missouri River-Great
Plains-Gulf division, and the lower
Mississippi, Ohio River and Appa-
lachian-Atlantic divisions get \$100-
000,000 each, and the Mississippi-
Great Lakes division \$50,000,000.**Agricultural Notes**To boys who do the best work in
judging live stock the Missouri State
Fair management offers cash prizes
amounting to \$180.Indian cattle for breeding purposes
are being imported into the Philip-
pines. Five hundred head have been
purchased by the island bureau of
agriculture.Beef cattle are bringing steep prices
in Australia. In one day's sale at Ade-
laide 65 bullocks were sold by one
cattle raiser at an average price per
head of \$149.26.A "round the world" service of
cargo ships has been announced by a
Japanese steamship company, vessels
to sail once a month from Hong Kong
through the Suez to Europe, returning
through the Panama.Latest advices from Uruguay show
excellent crop prospects for the cur-
rent agricultural year. The area de-
voted to wheat and other grains is
larger than usual, and the fact that
much of this is being grown from im-
ported seed gives prospects for im-
provement in quality as well as in
quantity.The United States commissioner of
labor recently sent 1000 circulars to
employers of labor asking how far
they required their employees to be
total abstainers. Six thousand nine
hundred and seventy-six employers
replied. Of these nearly 4,000 required
total abstinence of their men. Ninety
per cent of the railroads, 77 per cent
of those engaged in agriculture, 82
per cent of those engaged in business
and 88 per cent of the manufacturers
in the United States have made this
same ruling.Reports from Chile indicate that the
July and August shipments of nitrates
have been more than double those of
the corresponding months of last year.
These shipments are moving to Eu-
rope as well as to the United States.
The importations of nitrate of soda into
the United States in the month of
June, the latest available figures, were
93,076 tons valued at \$3,117,765,
against 57,411 tons valued at \$1,640-
067 in June of last year, and it is prob-
able that the July and August figures
will show an equal, or, perhaps, greater
advance over those of last year.The example of the French govern-
ment in sending a commission to
South America to study trade condi-
tions and the opportunities which may
become available as a result of the
war is being followed by the govern-
ment of Spain which is reported as
preparing to send a commission to
certain of the South American coun-
tries to study trade opportunities.
The population of Buenos Aires, Ar-
gentina, was estimated on June 30,
at 1,593,000, a total which is exceeded
by only three cities in the United
States, New York, Chicago and Phila-
delphia.Fourteen of the factories affiliated
with the Queensland (Australia)
Cheese Manufacturers' Association
closed down on account of the dry
weather, the Sydney Morning Herald
reports under date of July 26. The
supply of milk to the various factories
fell from 148,000 gallons in 1914 to
15,900 gallons this year. There has
also been a butter famine. People
with one or two cows in the neigh-
borhood of towns along the southern
line of New South Wales have been
able to turn their milk to profitable
account. Even supplies in pound pack-
ages have been sent to Sydney in
some instances.

Agricultural News Notes

of the Pacific Coast

Northern California

There are three almond-hullers busily at work in Guinda, Yolo County.

An alfalfa growers' association has been formed at Dixon, Solano County.

Early construction of the levees of the Sutter by-pass has been ordered by the state reclamation board.

The Yolo County farm bureau held a fair in connection with the Esparto Almond Festival on September 4.

Rice cutting is expected to start by the middle of September. This will be a month earlier than last year's harvest.

D. D. Green, formerly county clerk of Sutter County, has received the appointment of county sealer of weights and measures.

Sebastopol will have a potato conference September 25. There will be two sessions, one at ten in the morning, the other at two in the afternoon.

The Livermore center of the Alameda County farm bureau is preparing for a combined land product and stock show to be held Saturday, October 9.

The Five Counties Exposition, which is participated in by Lassen, Modoc, Shasta, Siskiyou and Trinity Counties, is being held at Redding, Shasta County, this week.

Farm Adviser Amundsen of Placer County has taken up as his first work the matter of securing someone to reopen the Auburn creamery which has been closed for several months.

A sheep cheese factory is to be operated this year at Esparto, Yolo County. The factory will run with 1250 head of selected ewes, the lambs to be marketed at three months.

Sixteen carloads of Nevada sheep were brought into Woodland, Yolo County, the first of the month. They will be fattened in the stock yards. Most of them are already sold to San Francisco buyers.

The Fort Bragg cannery is busy putting up string beans, and it is estimated that the total output of beans will be 4000 cases. About 30,000 cans of peas have been turned out. This has been the cannery's busiest season and extra help had to be hired.

Organization of the Sutter County Farmers' Protective League was perfected at a meeting in Bogue Hall on Friday, August 27. The purpose of the league is to inform members as to the marketing situation and so enable them to stand together for good prices.

A large tract of timber land near the coast in southern Mendocino and northern Sonoma Counties has just been sold to a Los Angeles firm. This was formerly the property of the Gualala Lumber Company and comprises some 25,000 acres of land on both sides of the Gualala River.

The Napa County farm bureau fair, held in connection with the St. Helena Vintage Festival, September 3-6, had a large circus tent filled with farm bureau exhibits. Adjacent to the tent the farm bureau conducted a cattle show where were exhibited dairy cattle, horses, swine, sheep and poultry.

Central California

The farmers' union warehouse at Tulare has already received 75,000 sacks of wheat and barley.

Fruit inspectors for the Pajaro Valley are L. P. Skov, B. B. Rich, A. J. Lewis and H. B. Hopkins.

Grass fires in the Fountain Springs and White River districts of Tulare County have destroyed 15,000 acres of feed and some timber.

One hundred twenty-eight tons of baled barley hay were burned last week on the Charles D. Cheney ranch, four miles south of Tulare.

Over 100 Kings County people attended the ground breaking ceremonies at the commencement of the work on the county highway system.

A train of 41 cars loaded with Sun Maid raisins left Fresno the last Sunday in August. The bulk of the shipment is consigned to foreign buyers.

Scale Insects was the subject of a talk by Prof. H. J. Quayle of the experiment station to orange growers at Riverside the evening of September 10.

Secretary Wright of the Watsonville Apple Distributors answers inquiries as to the effect of the hot weather on the fruit. He says there has been very slight injury.

The Prune Growers' Committee of Santa Clara County, which met in San Jose August 28 to collect statistics as to the 1915 crop, announces its estimate as 1755 green tons for this season's crop.

The Associated Raisin Company announces that orders are now in hand for the entire 1915 crop of seedless raisins. The price of Thompsons Seedless this year is about a quarter of a cent higher than last.

The new peach growers association is receiving many subscriptions to its capital stock. J. P. Bolton of Fresno is secretary. The executive committee has decided that \$250,000 of the capital stock should be subscribed by January 1.

More than 300 delegates from various points in the San Joaquin Valley attended the peach growers' mass meeting at Fresno Saturday, August 28. Meetings at different points in the valley will be held as soon as they can be arranged.

The Sunmaid special train of 42 cars of raisins, which left Fresno on Saturday, September 4, reached Chicago on the morning of the 9th. The train attracted much attention all along the line as it was well advertised and placarded.

The South San Joaquin district is intending to hold a community fair in Manteca October 8 and 9. The Parent Teachers' Association, chamber of commerce and farm bureau centers of the district are cooperating to make this a success.

The Central Stockmens' Association, composed of members from Fresno, Kings, Kern, Monterey, San Luis Obispo and Santa Barbara Counties, held its first annual convention at San Luis Obispo on Saturday, August 28. All former officers were reelected. H. V. Jack of San Francisco is president of the association.

Southern California

The cannery at Placentia will open September 20 on tomatoes.

Orange County's fair will be held October 12-16 at Santa Ana.

Escondido held a very successful Grape Day celebration Sept. 9.

The Palo Verde Valley is to vote on a \$1,000,000 levee bond issue.

Peach growers of Chino are proposing to establish a cooperative cannery.

A potato convention will be held at Nuevo, Riverside County, September 17.

California now stands third in the union in number of registered automobiles.

Hemet is to have a cooperative cannery owned and managed by fruit growers of the valley.

A new fruit and vegetable cannery has just been established at Buena Park in Orange County.

Orange County's board of supervisors have let the contract for paving the Santa Ana Canyon road from Olive to Peralta.

The Santa Ana Cooperative Sugar Company is soliciting beet contracts in the San Luis Rey Valley of San Diego County. It is expected to sign up at least 1000 acres.

The great Irvine Ranch in Orange County is shipping out 10,000 to 12,000 sacks of beans daily. It is estimated that the ranch will produce this year approximately 250,000 sacks.

Three thousand acres in the San Fernando Valley has been signed up to be planted to sugar beets for next season. The crop is contracted to the American Sugar Beet Company at Oxnard.

Live Stock Inspector R. W. Ritter of Imperial County reports that there is a serious outbreak of hog cholera at Westmoreland. He is urging farmers all over the valley to vaccinate.

The deer season opened on September 1 in District Number Four, which includes Los Angeles, San Bernardino, Riverside, Imperial, San Diego, Orange, Ventura and Santa Barbara Counties.

The California Vegetable Union has leased the warehouse back of the creamery building at Buena Park in Orange County. It expects to ship from this point at least 30 carloads of vegetables.

Ventura County's new live stock ordinance went into effect September 15. This ordinance provides for the quarantine of premises on which any infectious or contagious live stock disease exists.

Several representatives of Ventura County bean growers have been conferring with bean men of Orange County with the object of forming an inter-county association for marketing and maintaining prices.

Garden Grove has formed a local association which will affiliate with the Orange County Fruit Exchange. Directors named for the first year are: W. W. Dungan, J. O. Arkley, C. A. Westgate, Milo Allen, Ed Dozier, J. W. Crill and W. L. Russell.

The Coast

The grain harvest of Lake County, Oregon, is above average. Threshing will begin in a few days.

The farmers' association of Cochise County held its first annual convention at Douglas the last week in August.

Grain raised by dry farming methods near Eureka, Idaho, is now being harvested, in many places yielding 20 bushels to the acre.

A soil survey of Alaska has recently been made by the federal bureau of soils and its results will soon be printed in a bulletin.

Wheat growers of Sanders County, Montana, are threshing a good crop. They are holding for the good prices which they expect later.

Lectures on live stock topics will be delivered at the Spokane Interstate Fair by experts employed by the Northern Pacific Railway.

The first vessel of the season's grain fleet from Puget Sound sailed from Seattle August 30. It carried 6500 tons of wheat, bound for Australia.

The salmon fisheries of the Columbia River describe the season just closing as the best ever, the pack of spring salmon being about 35 per cent of last year's.

Warehouses in Columbia County, Washington, are taxed to capacity with wheat. Farmers are beginning to pile their grain sacks in the fields. Buyers are rather slow in taking hold.

Vice President Clark of the Oregon Hop Growers' Association, who has just completed inspection of the hop yards of the state, says that the entire hop crop will be under 100,000 bales.

The second annual Manufacturers and Land Products Show of Portland, Oregon, will be held October 25-November 13. This show is under the direction of the Portland chamber of commerce.

It has been held by the assistant attorney general of Oregon that state fruit inspectors have no power to open parcel post shipments while in the hands of the postal authorities. It is his opinion that they may only be opened before mailing and after delivery.

Railroads entering Arizona have made a new rule governing transportation of caretakers of live stock. In cases where shipments of more than one car belonging to one owner are made from different stations, or from one point to different destinations, free transportation both ways will be given to the caretaker.

Market reports received in Washington by the representatives of the government bureau of markets assisting in the marketing of pears and peaches have proved of such great value to shippers that W. H. Paulhamus, president of the growers' council, at the request of shippers, wired C. J. Brand, head of the bureau, asking that the agents be continued there through the apple season. Senator Jones also wired a similar request to Secretary Houston.

90% of gas engine trouble has always
been due to faults of ignition

The "ALPHA" Engine

"The gas engine without batteries"
Stops ignition trouble

THE ALPHA IGNITION EQUIPMENT consists of a gear-driven, positively-timed, built-in magneto, which we guarantee will last as long as the engine, and a simple, well-built and positive igniter. A hot fat spark is developed which quickly ignites the whole mixture in the cylinder and enables the production of maximum power from the minimum amount of fuel.

ALL ALPHA ENGINES not only operate but start on this magneto. It is hard to believe it until you see it done. In starting even the largest size Alpha Engine, only a partial turn of the fly-wheel is required and the engine goes right to work. No fussing or stewing over batteries, coils and spark plugs with which other engines are equipped.

THE ALPHA ENGINE IGNITION system is so much simpler that once you see it done you can do it yourself. No trick about it.

If you have had any experience with gas engines you will readily appreciate the great advantage of the Alpha in this respect, and even if you don't know gas engines, an inspection of the Alpha Engine will certainly convince you of its simplicity of construction and the excellence of its material and workmanship.

THERE ARE A DOZEN OTHER points of superiority of the Alpha that are just as important as the advantages of its ignition system, and these the nearest Alpha agent will be glad to explain to you. If you don't know the name of the Alpha Engine agent in your locality, we will be glad to put you in touch with him, or if there is no Alpha agent in your neighborhood we will send one of our own representatives to see you, upon request.

IN ANY CASE, WE SHALL BE glad to send you the finest gas engine catalogue ever printed.

Live Stock and Dairy

RESPONSIBILITIES OF THE BREEDER OF REGISTERED LIVE STOCK

Written for the California Cultivator
By W. S. Guilford

ONE of the most hopeful things about the live stock business in California is that an increasing number of the best men and women engaged in

it are beginning to breed registered animals.

This brings the query that is many generations old; "What will happen when everyone is breeding registered animals and there is no further market among beginners and those who have only grade herds and buy pure-bred sires?"

Probably no one knows just what will happen when this occurs, but at the present rate of increase that time is so far off that none of us need to worry about it. And if it should come there is no reason why pure-bred animals should not then be kept for the purposes of utility for which they are bred. There should be no disadvantage to the breeder who owns a herd of pure-bred dairy cattle to keep them for milk purposes alone if everyone else in the country had as good and because of this his market for pure-bred animals at a higher price than their milk-producing ability alone would warrant is shut off.

And pure-bred hogs make good pork; in fact many herds are kept for pork production alone and well pay for the extra cost of the foundation stock.

Let no one hesitate about starting in the live stock business because of the fear that it is going to be soon overcrowded, for while a good many are starting each year, the total number as compared to all of the breeders of live stock of all kinds is so few as to make a very small percentage.

There are some things that all beginners should understand and realize before they start.

A breeder of pure-bred animals should feel that it is his mission to maintain and improve the standards of excellence that have been set by his predecessors in the business. In order to do this he must study the living animals of the breed and learn as much as possible of the traits and characteristics of those represented in the ancestry of the animals in his herd, stud or flock, that he is not able to see.

The animals that are produced that are inferior should be discarded no matter what the temptation may be to sell them for some price because they are eligible to registry.

There must be accommodations for properly caring for stock if the business is to be conducted as it should be, and an abundance of feed must be available.

One of the very important things about the pure-bred live stock business is the keeping of records. A breeder must know absolutely that his animals are what they are represented to be. They must be plainly marked so that there can be no question as to their identity, and the records should be in such shape that the herd could be turned over to a stranger on a mo-

ment's notice. Animals must be registered promptly, and when they are sold there should be no delay in making the transfers of ownership. Many otherwise careful breeders lose many customers in delaying this transferring and registering, and any one who is not prepared and able to attend to the details of this part of the business should never engage in the growing of pure-bred animals for sale as registered stock.

It is as much a pleasure to see affairs of this kind well started and kept up as it is a disappointment to find the thing carelessly done. I have visited herds where the owner hardly knew the names of his animals—and was able to find their certificates of registry only after much hunting. And then there was so much doubt as to markings and identity that a prospective buyer would not care to risk buying anything in the herd.

And in others quite the opposite is true. There should be some kind of an office in connection with every pure bred herd, and all of the records should be there. And the more convenient the arrangements for keeping these the better it is for the owner or manager and the more is the buyer impressed that everything is as it should be. I saw some very clever ideas carried out in connection with the Berkshire hog herd at Butte City in Glenn County recently.

All of the original certificates of registry are kept in a safe, but the pedigrees of the animals and the records of litters, etc., are kept on a card system. Every animal in the herd has a number, and this is indicated by notches in the ears. These ear notches are marked on the application for registry, the certificate of registry when received, and on all of the ranch records of each animal. Then charts have been made of the pedigrees of the herd sires and the various brood sows, and these are hung on the wall. They are so fixed that they can be taken down easily. These make an easy reference, and everyone interested in the herd is able to become familiar with the breeding of the animals. Pictures of many of the animals represented in the pedigrees, which constitute the famous animals of the breed, are mounted and cover a large part of the wall area in the office. This makes a very interesting study—these pedigrees and pictures and records.

There is nothing complicated or difficult about the bookkeeping end of the pure bred business, but it must be done accurately and promptly.

There are many men breeding grade and scrub animals who are capable of handling pure breeds, and they would not only find greater profit in it but more to live for and work for.

Special attention should be given to the condition of the udder, and any milk which appears slimy, ropy, watery, or otherwise abnormal, should not be used as food. As a rule milk should not be used within 15 days before calving or during the first five days after calving. It is well not to use milk from cows which have been given powerful drugs, for these may pass through the tissues of the mammary glands into the milk.

SILOS

BUILT FOR YOUR PARTICULAR NEEDS.
EXACTLY AS YOU WANT THEM.
ALL SIZES AND DIMENSIONS.

16x36 REDWOOD STAVE SILO MANUFACTURED
BY US FOR THE PANAMA-PACIFIC INTER-
NATIONAL EXPOSITION, SAN FRANCISCO, 1915

TANKS

BUILT TO ORDER, TO SUIT ALL USES AND
USERS. CHEAPER THAN METAL TANKS.
LAST LONGER. WON'T RUST. CAN BE TAKEN
DOWN AND RE-ERECTED WITHOUT DAMAGE.
CAPACITIES, 500 TO 500,000 GALLONS.
TOWERS INCLUDED IF YOU WANT THEM.

ALL OUR SILOS, TANKS
AND PIPE ARE DESIGNED
BY ENGINEERS TO MEET
EVERY CONDITION.
MADE IN OUR
BIG FACTORY FROM

NO JERSEY FUTURITY STAKE THIS YEAR

We have a letter from Mr. Guy Miller in which he refers to the fact that there will be no California Jersey futurity stake this year, nor until the California state fair of 1916. All will understand that the state fair was called off on account of the Panama-Pacific Exposition. Also because of there being no state fair there will be no butter fat contest, not even at the Fresno fair which last year made a five-day test, at which there were entered 15 cows and which proved to be a most valuable test. Members of the association feel that Fresno has manifested so much interest in the wild west broncho bucking exhibit that it has no funds for the encouraging of an educational butter scoring test.

Regarding the futurity Mr. Miller writes:

"There was a meeting of the California Jersey Breeders' Association held in Modesto this month at which meeting it was decided to postpone the California Jersey futurity stake that was to be contested for this year until the California state fair in 1916, when it will be contested for by the present entries who will at that time be three-year-old heifers.

"This will in no way affect the futurity stake for 1916, as both stakes will be contested for at the same time in the regular five-day butter fat contest at Sacramento. It is expected that the futurity stake will be contested for annually at Sacramento in the regular five-day butter fat contest for heifers under 30 months old, as was originally provided for in the rules governing this futurity."

SWINE SPREAD FOOT AND MOUTH DISEASE

The susceptibility of swine to the foot-and-mouth disease and the failure on the part of swine owners to recognize its symptoms are giving the federal authorities no small amount of worry in their "clean-up" campaign.

Sore mouth, a common indication of the disease, is an ordinary sequence of hog cholera, and contusions on the feet are frequent in swine which have been driven or shipped. For these reasons little attention is paid by the owners of swine to these symptoms, and unless the herd is located within suspicious territory foot-and-mouth disease may continue in a chronic form for a considerable length of time before discovery. The danger of course lies in the ability of these animals to disseminate the disease.

Since the first case of foot-and-mouth disease found in a herd of hogs in Michigan, which later permitted the infection of the Chicago Stock Yards, hogs more than any other animal have been responsible for the spread of the disease. A few months ago, in the outskirts of Philadelphia, in a district containing close to 20,000 swine kept in small lots, several thousand were found to be infected.

Automatic devices which allow pigs to rub against an oiled surface have been placed on the market. The pigs soon learn to rub the portions of the body affected by lice against the oil which will kill the insects. This plan requires no time after installation except to keep the reservoir filled with oil. The medicated hog wallow has been recommended by some stockmen. This consists of pouring crude oil on the surface of the hog wallow.

Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

A Word to the Readers of the Veterinary Column

Attention has been called several times to anonymous letters. We can not give attention to those who will not sign their names. The name will not be published but we must know who the writer is. Also, the notice at the head of the column applies to all. The publishers do not pay nor request me to answer questions by return mail free and I feel sure it is worth the price asked for such replies. Letters sent direct to me may reach the paper one week earlier. I am ready and willing to help you all I can through the paper free, also willing to do what I can by letter as stated at the head of the column or will answer calls for as reasonable a fee as any other reputable veterinarian. Under these conditions, I am at your service.—Dr. Wm. Petrie, 2714 South Harvard Boulevard, Los Angeles. Telephone, West 209.

Ring-bone

Please tell what I can do for ring-bone. Is there any cure for it?—Subscriber, Clovis.

Probably the best treatment for ring-bone is to first remove the shoe and pare the foot so it stands square on the ground and put on a light shoe. Then clip off the hair up to the ankle and wash the parts clean. When dry rub in a blister made of one part cantharides, one part biniodide of mercury and six parts lard. Rub it in well, using plenty of the ointment. Then fire it by puncturing the skin in ten or twelve places with a pointed red hot iron. Tie the horse so he cannot reach it with his nose for 24 hours. Then grease it with lard and keep it soft by applying lard occasionally until the scabs are all removed. Repeat the blister, without the firing, every two weeks until four blisters have been used. Remember to tie up the head for 24 hours after each blister. You will get better results if the horse can run in a wet pasture or is turned loose in a box stall where there is a foot or more of straw or shavings. If you do not understand something about doctoring horses you had better get a veterinarian to do the firing for you.

A Balking Team

Kindly inform me through the Cul-

Sweat and dust are two of leather's worst enemies. One eats the leather fibre while the other cuts it with every movement the horses make.

EUREKA HARNESS OIL

saves the life of your harness. Leather is fairly honey-combed with pores. Eureka fills them, keeping out dust, sweat and moisture. It keeps your harness new. An occasional application does the business—an easy task, but one that saves you the cost of many a good set of harness. Dealers everywhere.

tivator how I may start a balky team. I have owned the team for three years and they never balked with me until two months ago. Another party overloaded them on a bad hill and since then they stop at the bottom of almost any grade with loads which they previously carried up without difficulty. I have tried kindness, severe

punishment and many suggestions without effect. They are 13 and 14 years old but are fine, big, gentle horses and until recently true to pull. Any advice that will help me out will be appreciated.—Subscriber, Searchlight, Nevada.

It is a difficult matter to start two balky horses. Separate them and give them each a new driver. They may work all right if hitched with other true pullers, but a poor driver may balk them again and at the same time spoil another horse. It about all depends on the driver, he must not lose his temper. You may be able to get them to forget their evil ways and work together by hitching a third horse in front of them. Do not hitch the third horse to the load but to the ends of two ropes tied around the bodies of the horses in the team. Use a 5/8 inch, strong rope; tie one end of the rope around the body of one horse just in front of the hind legs, so loosely that it will not annoy him when working and so that the knot will not slip. Leave one long end and pass that through a ring on the back pad, through a ring on the hame and to the horse in front. Do the same with each horse. Have the horse in front under control so he will not pull on the ropes unless you want him to. Then if the team stops, let the horse in front step forward and take a pull at the ropes. The team will probably follow. Work this way for a few days with very light loads increasing the load as you think best. In time you can hitch the third horse to the end of the tongue of the wagon and let him help to pull the load. In any case you had better change drivers. A new voice has a good effect. Never stop a load at the bottom of a hill. Stop far enough back so that they can pull several lengths of the wagon before reaching the hill. The main thing is to be kind to them and keep them thinking of something else.

Slavering

A few weeks ago I found the hay in the manger of a buggy horse all wet. Was told that his teeth were too long. Took him to a veterinarian and had his teeth attended to but he still slobbers. An eight year old team mare is also troubled the same way. Their feed is oat and wheat hay and ground barley. Can you tell what is best to do about it?—Subscriber, Concord.

There may be a weed in the hay that is causing it. In that case it will be hard to stop it unless you change the feed. There being more than one affected it, must be due to some external cause. If you do not see a change soon try giving the following medicine: Iodide of potash, four ounces, and water enough to make one pint. Mix and give a tablespoon on the feed or in the drinking water morning and evening.

Swollen Udder

Have a mare that the colts sucked after she had been dry nearly a year. Now her udder is swollen and very hard. What can I do for it?—Subscriber, Bachelor.

Rub it with the hands and milk out all you can two or three times a day. Also give her a tablespoon of nitrate of potash in the feed or water twice a day for a week.

Worms

I have a young stallion colt that will not get fat. His hair is rough and he looks very bad. He eats very well. I think he has worms. Please advise what to do for him.—Subscriber, Chowchilla.

Empty the bowels by giving two drams of aloin, two ounces of turpentine and one pint of raw linseed oil. Mix and give at one dose. Follow by

giving these powders: Powdered gentian four ounces, powdered nuxvomica two ounces, bicarbonate of soda four ounces and sulphate of iron two ounces. Mix and divide into 16 powders. Give one powder every day in the feed or by putting it in a bottle, adding a cup of water and giving it as a drench.

Carbolic Acid for Infectious Abortion

Please give formula for the use of carbolic acid in the treatment of cows for infectious abortion. I have a hypodermic syringe that holds ten cubic centimetres. How many cubic centimetres should be used? Also how is carbolic acid used in the feed?—Subscriber, Escondido.

Carbolic acid is safe used hypodermically if prepared as follows: Mix one part of carbolic acid, two parts glycerine and two parts water. Five cubic centimetres of the mixture is sufficient for a dose and should be repeated once a day for a week. That would be using one cubic centimetre of the acid at each dose. The injection should be made deep into a muscle on the chest or neck. Before each injection the hair should be clipped from the place and the spot scrubbed clean. Each injection should be made three inches or more from any former injection. In the feed or by the mouth as much as half a dram may be given but should be well diluted by mixing with linseed oil or with ten times the amount of alcohol and this again diluted with quite a quantity of water.

THE HARD MILKER

Some cows are naturally hard to milk; others are made hard by weak-handed milking. A woman or child with hands not strong enough for milking causes a cow to become hard for anyone to milk. To cure such a cow, oil the teat freely before starting to milk so that the oil will work into and soften the skin. Then milk the cow with as much force as possible, squeezing hard. This treatment will usually cure an ordinarily hard milker. Once in a great while it is necessary to cut the muscle surrounding the inside of the teat with a lance-like knife. This, however, is very likely to ruin the cow if not done with great care to avoid cutting too much and causing permanent leakage. It also makes a sore which is painful to the cow at the time of milking, and if done when the cow is not giving milk the wound grows together and the muscle becomes tighter than before.—R. M. Washburn, University Farm, St. Paul.

PACKERS MUST GET TOGETHER

(Continued from Page 267)

Of course the writer is aware that all men are not equal and that no two men will fill any given position with the same degree of efficiency, and nothing is further from his thoughts than to deny to any man the just return for ability displayed; but the wide divergence in these figures seems out of reason and indicates strongly the need of some readjustment.

Never before in the history of the citrus industry has there been greater

OFFICE EXPENSES PER CARLOAD IN RELATION TO NUMBER OF CARS SHIPPED

The profile in the above chart shows graphically the office expenses of 17 packing houses in dollars per carload per annum. The dotted horizontal lines are spaced at intervals of two dollars. The vertical lines divide the houses into groups according to the number of cars shipped by each. First group, six houses shipping less than 300 cars. Second, one house shipping 300 but less than 400. Third group, five houses shipping 400 but less than 500. Fourth group, three houses shipping 500 but less than 600. Fifth group, two houses shipping 600 and over. Office expenses include manager, assistant manager, bookkeeper, assistant bookkeeper, stenographers and clerks. (Chart by Garthwaite.)

necessity for strict economy and high efficiency and as in the early days of the business growers were forced into cooperation by unsatisfactory marketing conditions so the time is now approaching when the no less important internal problems will make necessary an even closer association. For this purpose the growers, or representatives from all of the various packing organizations must meet and discuss many questions of which the one set forth above is a sample and not the only nor the most important one.

CHEESE

Cheese, when properly cured, is not indigestible as many people suppose. Instead it is of high value as a food and should no doubt have a more important place in the diet. It should be remembered that there are two stages in the life of cheese. In the beginning it is tough and leathery and may be very hard to digest. Later, after it has gone through the proper processes of ripening and curing, chemical and bacteriological changes have taken place that make it more soluble and more digestible. Helpful ferments are produced and transferred to the stomach. It has also a condimental value due to the production of flavors and aromas varying with the variety. Such cheese is quite completely and easily digested as well as an aid to general digestion.—Farmer's Guide.

Didn't Sign

A Los Angeles subscriber who writes regarding signing away his rights to a homestead and now wishes to recover them should write again with signature and give full particulars, especially the wording of the contract which he has signed or else he should lay the whole matter before his own attorney. He apparently has relinquished all his rights to a valuable property.

Poultry for Profit

MASHES, WET AND DRY

Written for California Cultivator
By Jean A. Koethen

THE mash is the very heart of poultry feeding, the center around which everything else revolves. Rapid growth for the baby chick, materials for the building of frame and muscle, fat for the broiler and the elements necessary for egg production are all bound up in the composition and manner of feeding the mash. The old way of feeding whole grain exclusively did fairly well for stock on range, for they were able to balance their ration with greens and grubs. The confined bird has no such chance and is dependent upon a carefully balanced ration.

The chief purpose of using ground rather than whole grain and mixing several kinds together, along with beef scrap, blood meal or some other preparation of protein, is a better balancing of the ration. Wheat alone is nearly a balanced ration, but wheat is expensive, and no other grain alone would answer the purpose. Corn is too rich in fat, barley contains too much starch and sugar, oats, if we could only get the heavy, white variety, would be nearly as good as wheat, but most of the oats we get on this coast are poor stuff, hardly worth feeding. The right results cannot be secured by using any one of these alone, but by mixing them we overcome the faults of all.

Of all the ground grains used in the mash bran is the most important. It is richer in protein than the whole wheat, having a nutritive ration of 1:4 and sometimes less. It is one of the earliest feeds given baby chicks and one of the most necessary, for it contains not only protein for muscle building, but ash for bones. Chicks will do very well on bran and commercial chick feed, if they have range, but the addition of corn meal and middlings with an increasing per cent of animal food, makes for more rapid growth. I have found nothing better for baby chicks than the Cornell mash, which consists of three pounds each of bran, corn meal, middlings and beef scrap, and one pound of bone meal.

For young turkeys neither corn meal nor beef scrap is safe food, but a dish of bran with a little bone meal added, given two or three times a week, is very wholesome and supplies material for the building of frame, which is so important.

Since other food stuffs have been so expensive the use of alfalfa meal has increased. It contains a good deal of fibre and does not at all take the place of green feed, but it is rich in protein and can well take the place of part of the bran in the mash. A simple mash which I have found very satisfactory the past season contains one quart each of bran, middlings, alfalfa meal and ground barley, and one-half quart of beef scrap or fish meal. Fine ground bone is added to this a part of the time. This is my summer formula. In cold weather the mash consists of two quarts bran, one each of middlings, corn meal, alfalfa meal and ground barley, and one of beef scrap. Many commercial poultrymen make the meat portion of the mash

consist of half beef scrap and half fish scrap, and this is doubtless better than either one alone. I never bother with charcoal, which so many mash formulas call for, except for turkeys. Vigorous, healthy chickens which are not overfed ought not to need anything for their digestion if they have grit.

Public opinion has vacillated between the wet mash and the dry for some years, and every poultryman still has his own system. If the reasons advanced for the use of each were catalogued they would read something like this:

The dry mash is more easily fed, less wasteful (sometimes) and more wholesome. It can be mixed in quantities and fed from hoppers which need refilling but once a week, thus minimizing the labor of feeding.

The wet mash secures more rapid growth, stimulates the appetite, and makes a most convenient vehicle for the feeding of sour milk, vegetables and table scraps.

To my mind, the great advantage of the wet mash is that last mentioned. I see no particular object in simply moistening the dry mash with water. If it can be moistened with milk, however, either sour or sweet, there is much to be gained. At Cornell the dry mash is kept before the chicks, and the same mash, moistened with sour milk, is fed at meal time. At the Missouri station during the laying season in addition to the dry mash, which is always before them, the mash moistened with sour milk is fed daily about 2 o'clock. Where only a small number of chickens are kept table scraps and kitchen refuse can be cooked into a most appetizing mash. Cook up the potato skins, tomato skins, waste cabbage leaves, etc., with plenty of water. Thicken with the dry mash, and add stale bread and any other scraps of cooked food. When green feed is scarce I cut lettuce leaves, green alfalfa, raw onion or Swiss chard into such a mixture as this, add a little salt and pepper, and there is a dish fit for any fowl, and an egg maker that can't be beaten. Such a mash may be given morning, noon or night, as is most convenient, and does not interfere at all with the dry mash which is always before the hens in its hopper.

Stale bread is a very valuable food for all ages of poultry, when it can be had cheaply, but it should never be moldy. It is most palatable when mixed in such a mash as I have described. The hens do not care for it dry, and if it is merely soaked soft in water it may affect the bowels. Soaked and mixed with other things it is ideal.

The moist mash is always fed to birds that are being fattened for market, but it is composed largely of middlings and corn meal. It certainly hastens the growth of young stock and is perfectly wholesome if the birds are given only what they will clean up in a few minutes and the troughs are kept clean. It is the abuse of the wet mash, not its use, that does the harm. It may be fed with excellent results to molting hens, for this is a time when a little extra nourishment is needed. I know one poul-

tryman whose only concession to the molt is a feed of moist mash once a day. For pullets that are slow in beginning to lay the moist mash fed hot with a little chopped chili pepper added, is a splendid stimulant.

Is it true that the moist mash is more economical than the wet mash? Could we, here in California, go back to the method of feeding practiced for many years in Little Compton, Rhode Island, where the wet mash was hauled around to all the houses in the morning and a good feed of grain given in the evening, and the hens left to their own resources the rest of the time? I think we might easily do this very thing if our hens were on range as those Little Compton hens were. The hen is by nature a forager. If there is food within reach she will get it. Shut her up in a bare yard, and what is there to keep her busy unless she has a hopper of dry mash or grain in deep litter, or both, to nibble at? Personally, I like the wet mash, and I rejoice in its possibilities, but I do not see how we could spare the dry mash. We need them both and they are not in the least antagonistic.

AN AVERTED EPIDEMIC

Written for the California Cultivator
By V. R. Henderson

During the first week of August two houses containing 400 three parts grown pullets began to show marked signs of bad colds. The symptoms were copious running at the nostrils and a choking cough. Only one bird showed any matter round the eye, but quite a number looked droopy and rough in feather. The weather had been extremely hot down here (Phoenix), and the nights seemed almost as hot as the days. I mention this for a reason which will appear.

What I did was as follows: I killed nine of the worst; closed the sleeping houses during the day to give me a chance of destroying the bacilli already there, and to keep others out; with a sprinkling can I watered the earth floors and the walls with crude carbolic moderately diluted; in the drinking water I put potash permanganate and a good tablespoon of turpentine per gallon and I was careful to see that the birds had a fresh supply for the last drink at night as well as for the first in the morning, but no water was left in the houses overnight; I cut out the soft food for a time to give the enemy bacilli no suitable lodging place if I could help it. The result has been satisfactory. Within a week the birds began to improve, and by the end of the month they were free from colds and were looking strong and well.

As colds and various forms of roup seem to be common round here it may be as well to observe that they find their way into the flock through the weaker members of whom there are far too many. Stock from poor parents can never be anything but poor stock and a source of trouble and loss to the owner. And stock from the best of parents which has not had justice done to it in the incubator should never be allowed to get as far as the brooder.

As a secondary cause I believe that the great heat has much to do with the start and spread of disease. The lowering of energy and loss of vitality resulting from it renders the birds liable to be infected by any suitable germ or to develop any inherited tendency.

One remark as to the use of crude carbolic. When it is used the amount of cresylic acid which it contains should be known and the disinfecting solution should be made of such

strength that it will contain two per cent of the acid.

POULTRY AT THE RIVERSIDE FAIR

Those who contemplate exhibiting their birds will be interested in the premium list which Mr. E. I. Hammond, secretary of the Poultry Show at Riverside, will send upon request. In addition to cups and special awards there are five prizes offered on every breed and variety of fowls exhibited.

VEGETINE

Better Food for Poultry

- Stop hatching nothing but feed bills.
- Vegetine will save you 10 to 25 per cent and turn this waste into profit.
- Vegetine is the finest chicken feed because composed of thoroughly cooked vegetables, mixed with other ingredients, to give perfect balance.

RABBITS

Leading Rabbitry in America—Flemish Giants a specialty. Prize winning and heavy weight stock. Scored and sold on their merits. Inquiry and inspection solicited. Catalogue on request. Empire Rabbitry, Empire, Cal.

FARM LANDS FOR SALE

FARMS WITHOUT MONEY

We have 20 acre homes for twenty families. Level Sacramento Valley loam soil in Sutter County, 1/2 mile from Electric Ry. depot.

WE WILL WORK WITH YOU AND WAIT TILL YOU GET THE MONEY. No cash payment. All we want is for you to be a practical man and to put up a dwelling to cost not less than \$150, an electric irrigation plant giving 18,000 gallons per hour, which we can furnish for \$130 and a well which will not cost over \$75.

WE WILL PUT THE LAND IN AT THE REDUCED WHOLESALE PRICE OF \$115 PER ACRE.

No interest the first year; 7% the second year and \$10 per acre the third year. Balance to suit.

WE WILL MAKE EVERY ONE OF OUR CUSTOMERS A SUCCESS, but you must act now to take advantage of this offer. Come now and make your choice.

621 J Street Sacramento, Cal.

For Sale—14 acres, one mile from the business center of the city; all improved; modern bungalow, good barn, tank and windmill, chicken house, brooder house and pens. Fine opportunity for raising chickens; 11 acres in alfalfa, family orchard, berries, etc. Address, Mrs. Anna Stromwall, R. F. D. No. 2, Box 8, Merced, Cal.

Good Government Land relinquishment of 160 acres for the price of the improvements and work done; house, barn, fencing, fine climate, wood and water, \$650 cash. W. Wallace Baldy, Raymond, Madera Co., Cal.

State Map Showing School Land in different counties of the State, plainly marked, \$2.50. County sectional maps, showing vacant U. S. Land, plainly marked, \$2.50 each. Order TODAY. Booklet, FREE. Joseph Clark, Sacramento.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale or Exchange for Southern California acreage, 4 acres fine bulb or vegetable land in city of Santa Cruz. William Richard, owner, 438 River St., Santa Cruz, Cal.

Do you want a hog ranch? If so and you have a little money, write for my proposition to start you. E. A. Stephens, 945 Orange St., Los Angeles.

SEEDS AND PLANTS

West Coast Seed House, Los Angeles, is offered for sale. A good growing business, central location, low rent, no debts. Will sell stock at less than cost, fixtures at a big discount, and nothing for the good will. Business established for years and has a good reputation. Also sell Poultry Supplies and manufacture Poultry Foods and proprietary articles that have a good sale. The name "West Coast" is well and favorably known. Stock inventoried July 1st at \$9832, but somewhat less now and can cut out some raw materials if not wanted. Would prefer selling as above for cash, but if you haven't all the money and can give good security, I will give time. Or will trade for good, well located land. I have other business that takes my time. T. S. Tompkins, 116 East 7th Street, Los Angeles, Cal.

Best, Cheapest Forage for poultry, cattle, hogs. Get our prices. Plant now. LUTHER BURBANK SPINELESS CACTUS PLANTATIONS, SAN DIMAS, CAL. Covina phone 902.

Burbank Spineless Cactus—Hardest varieties, "Melrose" and "Special." Strong, matured slabs, \$3.50 per 100; \$50 per 1,000. Labranza Ranch, Athlone, Merced Co., Cal.

Tepary Beans For Sale—I have a limited amount I will sell for 6 cents, F. O. B. Redlands. Buy your seeds while they are cheap. Planting time this year they sold for 22 cents. A. B. Ward, Yucaipa, Cal.

Peruvian Alfalfa Seed—Hairy varieties, also Algerian wheat. S. P. Huss, Yuma, Arizona.

Genuine Burbank Spineless Cactus—Strong mature slabs, \$3 per 100—\$25 per 1000. Thos. Cathers, Morgan Hill, Cal.

SCHOOLS AND COLLEGES

Wanted—About seventy-five young men and women to enter The WESTERN NORMAL on August 30th, to prepare for teaching. Western Normal graduates secure and hold good positions. We assist graduates to secure good positions and promotion. We save you time and money. For information, address, WESTERN NORMAL, J. R. Humphreys, Principal. Stockton, Cal. 634 E. Main St.

Telegraphy—Stenography, bookkeeping, English branches. Positions guaranteed. Mackay Business College, Los Angeles.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Krukeberg Press, 237 Franklin St. Los Angeles.

SUCCESS IF YOU DO

Keep the nests clean; provide one nest for every four hens.

Gather the eggs twice daily.

Keep the eggs in a cool, dry room or cellar.

Market the eggs at least twice a week.

Sell, kill or confine all male birds as soon as the hatching season is over.

Los Angeles, Los Angeles Poultry Association, Jan. 5-11, 1916, Walter M. Ross, 224 Colorado Boulevard, Glendale, secretary.

Ontario-Upland Pigeon and Poultry Association, Ontario, San Bernardino County, January 27-29, 1916.

Seattle, Wash., King County Poultry Association, Jan. 10-15, 1916, C. W. Melville, 473 Colman Building, Seattle, secretary.

Sacramento, California State Poultry Association, Jan. 14-18, 1916, C. A. Wilkins, P. O. Box 1117, Sacramento, secretary.

THE PROLIFIC HEN

A most pernicious idea appears to be gaining ground in regard to the qualifications of a hen for breeding. The number of eggs she will lay is apparently the only passport to the breeding pen, regardless of development or constitution. By all means let us have the prolific hens for this purpose, but let us see to it that they are otherwise qualified. The foundation of success in poultry keeping is ability to hatch and rear strong, virile chickens, and these can only result from strong, well developed, well cared for parents. This also applies to the subsequent egg production. Therefore it follows that if a hen is weedy and run down she is not a fit subject for breeding, no matter how many eggs she has laid. But it does not follow that a good layer should be discarded as a breeder. That would be going to the other extreme, but what should be insisted upon is bodily development of sufficient proportions and strength as will indicate a breeder of robust stock.

The first investment in raising pork is small and the pig is a quick money maker on the farm. He multiplies rapidly, and if we only furnish him good pasture, grazing crops, pure water, and a little concentrated feed he will rapidly gain weight at a small cost.

QUERIES

(Continued from Page 273)

that a fair proportion are worth keeping three years.—J. A. K.

Leg Weakness

My turkeys are losing the use of their limbs. I am feeding them Gyp corn and ground alfalfa meal soaked in water. Since the leg trouble manifested itself have been putting slacked lime in the meal.—Subscriber, Modesto.

The ration is lacking in protein and also in material for the making of bone and muscle. I am not told whether the birds have range or not. Presumably they have not, or if they have, it lacks the bugs and other insects which a turkey requires. Turkeys on good range need very little food. Turkeys that are confined must be supplied with protein in the form of cottage cheese, cooked liver or hard-boiled eggs. Growing turkeys also need bran and some bone meal for building frame and muscle. I would give these birds the best range I could find, a dish of dry bran and charcoal once a day to nibble at, and three times a week I would mix into their bran about ten per cent of fine bone meal. If they seemed too heavy for their size I would cut down the ration considerably and encourage them to exercise by driving them around a little. Turkeys that are overfed are inclined to loaf instead of foraging and lack of exercise alone makes the legs weak. I am doubtful about Gyp corn for turkeys, thought I know many persons use it after the first three months. It is better than Indian corn but not as good as wheat, being less easily digested and more fattening. If you can give your turkeys range, and cut down the ration so that they will be obliged to forage, giving fresh green feed instead of the alfalfa meal, some wheat, if possible, instead of an exclusive grain diet of Gyp corn, and the bran and bone meal to tone up their bones and muscles, I think you will soon find them regaining the use of their legs.—J. A. K.

Establishing Title

I have some land bordering on the course of the Los Angeles river. I do not know whether my title is good although I have been paying taxes on this ten acres for a great many years. The boundaries are uncertain. Can I get my title established under the Torrens Act? Have had the land surveyed recently and I want to have the boundaries fixed officially.—Subscriber, Los Angeles.

The first step to take would be to get exact location of corner stakes. Then either through the Torrens system or through title searchers determine whether you have clear title. It is unwise to pay taxes until your title can be reasonably definitely established.

Ants in Lawn

How can I get rid of black ants in a clover lawn without injury to the lawn?—Subscriber, Orange.

A teakettle of boiling water will do some good though it will kill out a very small spot in the lawn. The same is true of carbon bisulphide, which may be kept in a common oil can, the nozzle being inserted in the opening of the ant hole and two or three pressures of the thumb will deposit sufficient of the liquid, which creates a poisonous gas, to kill many of the pests. A remedy which would not injure the lawn is taken from "Essig's Injurious and Beneficial Insects." This is recommended by Prof. Woodworth: "We obtained by far the best results by the use of a very weak solution of arsenic and syrup. Most of the commercial

ant poisons commonly known as ant pastes consist of arsenic and syrup, but are made very strong in arsenic. This kills the foraging ants almost immediately. We found by reducing the arsenic to between one-fourth and one-eighth of one per cent they would take large quantities of the material to their nests and feed it to the young, and the whole nest would be killed by a slow poisoning. The most convenient way of exposing the poison to the ants is to use a large jar with a perforated cover and within it place a sponge saturated with the arsenic solution. The ants will enter through the perforations in the cover, fill themselves with the arsenic solution and carry it to their nests. The sponge will hold enough poison to require two or three weeks to empty it, and before that time the ants will almost entirely disappear."

Chicken Pox

About three weeks ago I noticed one poult with something like water blisters on the head. Soon another was similarly affected. I isolated them at once. Now a few more have developed the same symptoms. Their appetite is good and none have died. I would like to know the cause and cure. There is no scab, but some of the blisters have oozed a little. I have them in clean quarters and have put blue stone and kerosene in the drinking water.—Subscriber, Lakeside.

I think your turkeys have a mild form of chicken pox. It is a very infectious disease, and infection is often carried year after year in houses and fences and feed troughs that have not been disinfected after the disease has been in the flock. Calcium sulphide (sulphide of lime) is the only drug that seems to have any effect in controlling or preventing the disease. The dose is a grain for each bird to be treated, given every morning for a week in a small quantity of moist mash, and then every other morning for another week. Be sure the drug you get is fresh and strong. You can give this to the whole flock if the disease seems to spread. It may prevent some from taking it.—J. A. K.

Plymouth Rocks

Please inform me if yellowish feathers in backs of Plymouth Rocks are an indication that they are not pure bred?

Is five to six and one-half pounds considered large for a R. I. R. male bird for breeding purposes? Wish to raise a heavy breed.—Subscriber, Pond.

There must be some stain on the purity of Barred Rocks with yellowish fathers on the back, for no yellow or buff cross had any place in their making. I should not breed a bird with such a defect in color even though I knew there had been no out cross for many years, for it would spoil the color of later generations.

Standard weights for Rhode Island Reds are: Cock, 8½ pounds; cockerel, 7½ pounds; hen, 6½ pounds; pullet, 5 pounds. If you breed from a male that is under weight you will never have heavy stock.—J. A. K.

Articular Gout

White Rock hens have disease of legs. The legs and feet first become rough and after some time they get very knotty and then become inflamed and don't heal, so I am obliged to kill the hen. She seems healthy until the leg becomes inflamed. I have several kinds of hens but the White Rocks are the only ones having this disease. Do you know of any remedy?—Subscriber, Riverside.

This looks like articular gout, a disease due to the failure of the kidneys to eliminate the urates. Crystals of urate of soda are deposited in

nodules around the joints of the feet and toes, and these sometimes ulcerate. Advanced stages of the disease are seen only in old birds. When it has reached this stage it is considered incurable but is sometimes relieved by rubbing the legs and joints with camphorated or carbolic ointment. The birds should be kept in clean, comfortable quarters and given a great deal of green feed and very little animal food. A dose of Epsom salts (half a teaspoon to a bird) will help the kidneys to resume their function.—J. A. K.

Doctor Book for Stock

Can you recommend a good book for live stock, including horses and cattle?—Subscriber, Daggett.

The Farmers' Veterinarian, published by the Orange Judd Company, New York, or supplied by the Cultivator at \$1.50 is a good book. On more general topics we have "First Principles of Feeding Farm Animals," by the same author, C. W. Burkett. There is another good book by M. W. Harper, "Management and Breeding of Horses." Productive Feeding of Farm Animals by Woll is an excellent book, as is Feeds and Feeding by Henry. Along veterinary lines we may refer to two publications put out by the department of agriculture, Diseases of Cattle and Diseases of the Horse. It is possible these may be secured by writing your representative in congress or one of our state senators.

Water Garden

I am going to have an aquatic garden; my pool will be partly in the sun and partly inside the pergola, with a fountain in the center. Please tell me what plants to use for the shady side of the pool, blossoming plants. Also tell me if goldfish and trout will thrive in the same pool and what to feed them, how often, etc. I want to have more than one variety in the same pool, if practicable.—Subscriber.

A background of aquatic grasses with Japanese iris or some water-loving plant in the foreground will be excellent. Of course if you have large enough space a background of caladiums or elephant's ears is fine, but bear in mind these take an immense amount of space and overshadow everything else if crowded. It is hardly probable that trout will thrive in an ordinary shallow pool for the water becomes warm and the conditions are very different from those under which trout thrive. Variety may be secured, however, with different members of the goldfish family. As to feed, if the pool is large enough and algae are allowed to grow these will furnish all the food needed. However, bread crumbs—a few now and then—are relished by the fish. There is also a regular fish feed put up, but for fish in a large outdoor pool we do not think this is necessary.

Sudan

Is Sudan a valuable grass? Does it make good hay? What are the soil and water requirements? Will it stand more alkali than alfalfa? Does it require as much water as alfalfa?—Subscriber, Grafton.

Sudan may be grown with much less water than is required for alfalfa. It does not produce as much tonnage as the sorghums but makes a much better hay or fodder. We are not informed as to its resistance to alkali but assume that in this respect it is much the same as Johnson grass, to which it is very closely related. As a dry weather, warm climate, catch crop it is being tested in California and another year we will be able to give more definite information. The general impression is that it is very satisfactory. Write to Department of Publications, Washington, D. C., for Farmer's Bulletin 605, "Sudan Grass as a Forage Crop."

Out of Town Home-Furnishers

should take advantage of the many SPECIAL FURNITURE OFFERINGS we are featuring at the present time—carloads of beautiful, high grade furniture for Bedrooms, Living-rooms, Dining-rooms, Porches, etc., which have been SPECIALLY BOUGHT so that we are able to offer them to you at

The Household Department

THE OLD-FASHIONED DAYS

Backward, turn backward, oh, Time, in your flight!
Let's be old-fashioned again for to-night;
Drink from the moss-covered bucket we knew
Back in the days when bacilli were few;
Never a thought of a germicide then, Yet the babes grew into big, stalwart men.
Backward, turn backward, to boy-days serene
When people knew nothing of germs or hygiene.

Backward, let's go to the old country school,
Simply forgetting each sterilized rule;
Drink from the rusty tin dipper, nor fear
That millions of microbes might be lurking near.
Put up the gargle, bichlorides and spray,
Chuck all the new antiseptics away!
Backward, turn backward, once more, if you please
Ere everyone worried about some disease.—E. A. Brininstool.

THE HOUSEHOLD CONTEST

WHAT use do you make of dried fruits in your cookery? Is there anything better than sun-dried peaches, apricots, prunes, raisins, etc.? Here in California where we have so much fresh fruit the year around do we use less dried fruit than we might? The Cultivator wants to see its household department in the issue of October 21 filled with recipes for the using of our dried fruits.

For the best there will be a cash prize of \$2.00, for the second best, \$1.00. All whose recipes are published will receive three months' extension of subscription, if they have not already secured such extension this year. With your article send name and address of member of your family now receiving the Cultivator that the extension may be properly credited. Or, of course, a new subscription may be started instead.

Write Early

Send your recipes to Household Department, California Cultivator, Los Angeles, by the morning of Thursday, October 14. Please use one side of paper only. With your recipe we will be glad to receive suggestions for future contests.

Prize Winners This Month

First prize, Mrs. A. C. Pickett of Riverside; second, Mrs. Floy Crosby Smith, Fair Oaks. Mrs. Pickett's suggestion of a written list for the children's work seems a very happy one. We wonder if other mothers have tried it.

SATURDAY, A HAPPY DAY

By Pansy A. Laughlin, Escondido

Saturday may become a day less to be dreaded if the homemaker will finish up as much of her work as is possible on the other work days and simplify her preparations for Sunday. Saturday used to be the day that I disliked the most. Now, I like it. In former times there was usually a bit of washing to do, and a little ironing that had been left over, and some sewing to finish up and cleaning and scrubbing and cooking. There might even be some of the children's heads to be washed or a few windows to be cleaned. Anyway the day was so full and long and hard that it was quite impossible for me to keep the Sabbath day holy because I was so worn out. Then I decided to make a change in my work.

Now every bit of washing, ironing, sewing, scrubbing, special cleaning, etc., is done on some other day of the week. On Friday the house is swept and dusted and each member of the family "helps mamma" by being careful not to get things dirty before Sunday. (This plan incidentally teaches them to keep the house neater during the rest of the week). Early in the week the Sunday clothes are cleaned and mended and put away in certain places where each member of the family can get them. Then when Saturday comes I have the usual three meals to get, the bedrooms to straighten up, the children to look after and the Sabbath dinner to prepare.

Instead of cooking most all day Saturday to prepare a Sunday dinner, I plan a simple dinner but a good one and prepare things we haven't had for a little while. Instead of wearily beating eggs, creaming butter and sugar and icing an elaborate cake I beat up a dainty cottage pudding while I am preparing Saturday's dinner and bake it in gem pans. At the same time I make a rich lemon sauce, and most people who have eaten this desert at our house seem to enjoy it. I know we do. For a sample menu for a simple dinner I would suggest stewed chicken, potatoes, peas and cottage pudding. Or one may have a nice pot roast with potatoes and tomatoes and melons or fruit for desert. You can

readily see that dinners of this kind may be mostly prepared on Saturday with very little time and labor.

So Saturday in our home is really a preparation for the Sabbath. We have time to put a few flowers around and enjoy our anticipations. For only when the mother is happy and not worn out can the home be a happy one. And Sabbath day is the happiest and best day in the week for us.

THE HOUSEWIFE'S BUSY DAY

By Mrs. Floy Crosby Smith, Fair Oaks

When there rests upon the shoulders of one woman the responsibility and care of a large family of children the law of self-preservation compels her to seek ways and means for conserving her own time and strength. So from my own experience I would suggest as a means of making Saturday a less strenuous day, beginning working toward that object at the other end of the week. One does not need to carry this to extreme as did the Aunt Maria who in her eagerness to get ahead of her work always improved her opportunity when cooking a meal by baking a pan of soda biscuit to have ready for the following meal.

Still if one does not wish to become hopelessly engulfed in work it seems necessary to have a general plan of action.

My own plan has been to do the heavy work the first of the week, following the Sunday rest. Then when the washing and ironing are safely out of the way instead of looming a black cloud ahead, the middle of the week is left for sewing, canning or any other extra work.

Friday morning I change the beds, sweep the house from top to bottom, and do any extra cleaning that may be required upstairs. I arrange my bread making so the dough can be mixed just before bedtime. Saturday morning the bread goes into the pans while the fire is starting. After breakfast I heat the oven and bake whatever I shall need for Sunday and the wash day following. By the time this is done the bread is ready to go into the hot oven, and while keeping a watchful eye upon it I mop the kitchen and dining room floors. So by time to start dinner the dreaded "Saturday's work" is out of the way.

If there are windows to wash or cupboards to clean do them some cool morning during the week, don't let such jobs accumulate for Saturday.

I usually devote Saturday afternoon to odd jobs so I may start the next week with a clean record and no leftovers. Perhaps there are some new garments needing only button holes to complete them, some piece that needs mending before it goes into the wash, a suit that needs cleaning, a door yard or flower bed that needs attention or even a letter to write.

On a busy day, the children, even if quite small, can be a great help, as with a little instruction at first, they can do the dusting, pick up scattered articles, scrub porches, etc.

Another thing that saves time all through the week is planning the meals for a day ahead. While doing the kitchen work in the morning I think out the bill of fare for the three following meals. At first this may seem a task but it soon becomes a habit which is followed almost unconsciously. By knowing exactly what you will need you can make one trip to the garden instead of three, you will know just what you want when the butcher's wagon or the vegetable peddler arrives, will often save both time and fuel by cooking for two meals at once, and will usually have the solution to the housewife's constant puzzle, "what shall I get to eat?"

It is impossible to follow any iron-clad rules for things will claim your time—the stove may smoke or the clothes line break, or the baby refuse to take his nap; but by fitting each day's work into its proper place, Saturday will fall into line with the rest and cease to be a bugbear.

BUILDING MATERIAL CHEAP

SAVE MONEY

One order placed with us will prove to your satisfaction that you can make the biggest saving here. Our overhead expense is extremely low, thus enabling us to quote absolutely rock bottom prices. Our stocks are positively complete. You can get just what you want, at the right price. Prompt deliveries always. Give us a trial and you will be a regular customer.

Timely Suggestion to Ranchers

Now is the best time to fix up your fencing and repair poultry houses, barns, roofs, etc.; before wet weather. Get our prices on fencing, poultry netting, repair lumber, etc.

SATURDAY'S WORK

By Mrs. A. C. Pickett, Riverside

Housekeepers are tempted to crowd the unfinished work of the entire week into Saturday. This added to the necessary work makes the day often a bugbear. I have discovered that it is a wise plan to sit down quietly with pencil and paper early in the morning of Saturday (and other mornings as well), making out a schedule for the day, also menus for the day and Sunday. I teach in Sunday school and never get home from church until after noon, so plan a dinner that can be put on the table in a few minutes. Here the fireless cooker lends its aid, especially in winter. A good substantial dish of chicken and dumplings, Spanish stew and dumplings, home-made tamales, baked beans, something of this kind hot with the dessert and other things prepared on Saturday, make an acceptable meal, much better than having the hungry family waiting for things to cook while good impressions from the service fade away.

I try not to have any cleaning to do on Saturday except kitchen and pantry after baking is finished, and never can fruit if it can be avoided or start new sewing.

If there are school children in the family, this is the day we have their help. It should be a happy day for them but all play does not necessarily make a happy day. I have found that the written "list" works well with children, also. All the odd jobs and regular chores and suggestions as to pleasures are written down for my thirteen-year-old boy. He likes it much better than to be constantly called to do this or that. He can do the work early in the day and then amuse himself or alternate work and play, just as he chooses, only the work items on the list must be crossed off before evening. The plan works even better with girls. It is almost like a game. I have seen the children consult their lists (which they carry in their pockets) when playmates come to visit them, and say, "Well, I only have such and such things to do yet." Often the playmates choose to help with the work and so have more time for play. I try never to add to their work later in the day as that discourages them.

Little children, especially, love to eat out of doors, anything savoring of a picnic delights them; a few ants or flies, a hungry dog or kitten do not disturb them. Adults prefer the screened dining room. My children ate their suppers on the lawn half the time in the summer or carried their basket and melon to "camp" under some tree farther away. Very few dishes were used and these the children washed. To a tired mother it is often restful to eat a meal with no children to wait on.

Interruptions are more often the rule than the exception to the housekeeper with no paid helper (either in town or country). All the more important then to have a time and place for rest and recreation every day, for a tired out mother can not be an efficient homekeeper.

SATURDAY WORK

By Mrs. G. A. Giber, Cohasset, Minn.

Since my Saturday's suggestion must come from experience on a large farm I am afraid it will hardly be applicable or practical for the California home where the butcher, baker, grocer and laundryman are always at one's command.

On Friday I clean thoroughly everything as far as the kitchen, also the men's bunk, and since our men come direct from the field to meals we dine in the kitchen, thereby saving a great deal of work as well as making it unnecessary for me to touch the rooms previously cleaned until Sunday morning, when I give them a light dusting and arranging.

I have found the most essential thing to remember is the value of the early morning hours. I get up at 5:30 and by 6:30 breakfast is over and the men ready for the field. Then I carefully pile up my dishes and make up the bread. Next I bake my cakes and while they are cooling prepare the pies. By the time they are baked the cakes are ready to frost. Then I wash both baking and breakfast dishes and if I am having chicken for Sunday dress them

and put on ice. After this I clean the kitchen, with the exception of the stoves which I leave until after dinner. I forgot to mention that immediately after breakfast I put the boiler of water on and just before cleaning the kitchen soak my clothes in a solution of soap and ammonia. This gives me an early start for Monday and by 8:30 or 9:00 the washing is done.

Salad dressing, puddings, etc., I leave until Sunday morning, so with the exception of the stoves I have only the bunkhouse and creamery for the afternoon. By 2:30 or 3:00 I am usually through and have a few hours for my own recreation. I have each day's work mapped out and try to follow it as systematically as I can. I have never had any extra help, even at threshing time, and always find plenty of time for my reading and correspondence.

SATURDAY WORK

By Mrs. A. C. Pickering, Fullerton

I plan to do the weekly sweeping and dusting on Friday and usually try to bake bread on that day.

The first thing after breakfast on Saturday I place my pies in the oven, then wash the dishes. When this is finished I stir up a cake and by that time the pies are done, and the cake is placed in the oven. While it is baking I make beds and straighten up the house. The bread is always out of the oven by 1:30 and by 2:00 o'clock all the Saturday work is done.

HOUSEHOLD QUERIES

Mock Whipped Cream

Please give recipe for mock whipped cream made from the white of eggs. —Subscriber, Chino.

We have never heard of a recipe for making whipped cream entirely of white of eggs but believe a cream is made of a mixture of cream and white of egg beaten until of the desired stiffness. A pinch of salt will often hasten the thickening. Where one has thin cream not thick enough to whip alone the addition of the juice of half a lemon to a half pint of cream will cause it to whip as well as the regular whipping cream. The pulp of ripe bananas run through a sieve and added to the white of egg and beaten stiff is said to make a very nice cream filling. We give recipes for mock cream and marshmallow frosting.

Mock Cream

Scald one pint of milk in a double boiler; stir two level teaspoons of cornstarch with two or three tablespoons of cold milk, then stir into the hot milk; let cook ten minutes; add one-fourth teaspoon of salt and two tablespoons sugar and let chill. Fold in the whites of two eggs.

Marshmallow Frosting

In a saucepan heat slowly to the boiling point without stirring three-fourths cup sugar and one-fourth cup milk, then boil six minutes. Break one-fourth pound marshmallow into pieces, melt in a double boiler, add two tablespoons hot water and cook until the mixture is smooth. Then add the hot syrup gradually, stirring constantly. Add one-half teaspoon vanilla, then beat until thick enough to spread.

Canning Sweet Peppers

Can you tell me how to put up pimientos similar to those we buy? I have a good many and would like to can them if possible. —Subscriber, Orland.

From a former Cultivator we reprint method of canning peppers. Cut open green or bull nose peppers, clean out seeds and cut in strips the size of a string bean. Pack into jars which have been rinsed in warm or cold water and cooled. Cover to the brim with salt water (one pound salt to seven gallons of water). Rinse cap in cold water and place on jar but do not clasp or screw down as the steam which forms inside must find an outlet. Place a board with holes in it or a few pieces of lath nailed crosswise in bottom of boiler. Set jars on this rack and pour water in, filling even with neck of jars. Heat gradually to a boil, then boil for three hours. "Boiling" does not mean "simmering." Count time from the time water begins to boil and keep boiling steadily for the full number of hours

specified. Keep lid on boiler. Remove jars while boiling hot and set aside to cool. Do not set on a cold or wet surface or in a draft.

Cold Water Process—Cut off stem end of peppers and remove seeds. Parboil until tender but do not cook long enough to cause them to lose their shape. Pack in jars, pour cold water over them and seal. They are ready for use any time during the win-

ter and may be used for stuffing with coldslaw, leftover meats, etc.

Preserving Cider

Will you kindly inform me how to stop cider from working when it has reached the desired degree of sharpness?—Subscriber, El Monte.

To each 22 gallons of cider to be

(Continued on Page 287)

"Fred"—

"Put this can of Ghirardelli's Ground Chocolate in your basket. You'll find it the most convenient, nourishing, delicious, economical food beverage you can get. There are imitations but I don't handle them as my trade always demands Ghirardelli's."

And Fred took his grocer's advice. He now uses Ghirardelli's Ground Chocolate as a beverage—morning, noon and night. You can make a cup in a minute. For unusual desserts it hasn't an equal.

Buy Telephones for Telephone Service

THERE is as much difference in telephones as in automobiles, and they should be bought as carefully. You want to use a phone giving reliable service. Cheaply made phones sometimes give good service for a week or a month; then trouble begins. Repair bills make cheap phones costly. Voices come over the wire faintly. Many sounds do not get over at all.

With a Kellogg Telephone repair bills amount to nothing. After years of use you can hear a watch many miles away tick loudly and clearly. They are so strongly and simply made that everywhere among users of telephones the name Kellogg has come to stand for ideal telephone service.

Kellogg Telephones Stand for Service

They are made in the largest independent telephone factory in the world. Every instrument passes 37 rigid tests before it is shipped. You have day by day the satisfaction of using a phone that makes telephoning a pleasure.

We have an expert department costing us \$100,000 a year that is maintained for telephone users and those who are starting new lines. Why not put your problems before these experts? The service costs you nothing. You cannot fail to get information that will save you time, money and trouble.

Get your name on our books to receive valuable bulletins and other telephone literature that we send free.

Write for Bulletin 24.

HAY

Under date of September 11, 1915, Scott, Wagner & Miller say:
Receipts of hay for the past week were 4047 tons. Although receipts are large they moved off readily and prices have been firmly maintained. Very little choice hay of either wheat or red oat has arrived during the week. The few cars that did come in sold readily at top quotations and we believe an advance can be looked for.
The fields are cleaning up rapidly and the next two weeks will see most of the

hay under cover, after which it is natural to expect advance in prices to at least cover storage charges. Export trade is about as usual.

Choice alfalfa (third and fourth cuttings) from the river districts is very strong and in light supply, whereas interior hay is not much sought, arrivals of same being nominal. Straw is without interest, demand being very light.

We quote the average wholesale price of hay in carload lots on today's market as follows:

Wheat Hay (1st bale)	14.00@15.50
No. 1 Wheat or Wheat and Oat	12.00@13.50
No. 2 Wheat or Wheat and Oat	8.50@10.50

Citrus Fruit Market

LOS ANGELES, Sept. 15, 1915.

A slightly better condition obtains as to all citrus fruits; orange shipments are decreasing somewhat in number and Eastern markets are receiving a smaller quantity of their local fruit. The best grade Valencia is commanding \$3.75 to \$4.25 f. o. b. California.

A streak of warm weather has given a healthy movement to the lemon market. The quantity of stock in the market has been cleaned up and prices are now running at from \$2.25 to \$3.00 f. o. b. California. This only for the very best grade of fruit.

Shipments

Shipments of oranges to date from Southern California since November 1, 1914, 31,657 cars, lemons 6268, total 37,925. To same date last season: oranges 36,183, lemons 2689, total 38,872. Central and Northern California shipments are same as given in last issue.

NEW YORK, Sept. 13.—Eleven cars Valencia, eight cars lemons sold. Market from 15 to 20 cents higher on Valencia, 25 to 50 cents higher on lemons. Fair.

SOLANO COUNTY FARM BUREAU HORSE SHOW

Written for California Cultivator
By J. W. Mills

The biggest event in the history of Solano was the Farm Bureau Horse Show on September 9th. The procession counter-marched on Main Street and 120 head of blooded stock, groomed and decked in the colors of the Spanish settlers of old, produced a sight that made the lovers of horses thrill. The board of supervisors of Solano County headed the parade on a float drawn by four handsome draft horses entered by a San Francisco firm.

Among the pure blood Percherons, prize winners were owned by the following: Percy Anderson, P. Drouin & Company, Rio Vista Horse Company and Rubel Estate, all of Rio Vista. Belgian stallion by Drouin & Company. Shires owned by Neil Anderson, John McCormick and E. W. Westgate, won prizes in five different classes.

Grade horses drew nine prizes and mules and jacks carried off seven prizes.

Prof. C. W. Rubel, farm adviser of Alameda County, acted as judge of the stock and although it was a difficult undertaking, expressions of satisfaction were heard on all sides, even from those who did not carry off first prizes in some instances.

Dean Barrows of the state univer-

sity delivered the address of the day and the Vacaville brass band furnished music.

In the afternoon water sports and music entertained the crowd of about 2000. Speed launches, tugs of war, high and fancy diving by members of the Olympic Club of San Francisco, yachts and swimming races kept the Sacramento river opposite the grandstand well churned before a delighted audience all the afternoon. A water pageant in the evening followed by a grand ball completed a well-filled day and thus ended Solano County's first farm bureau celebration.

HOUSEHOLD QUERIES

(Continued from Page 285)

preserved add 154 grains of bismuth subnitrate. It must be borne in mind that cider preserved in this way could not be offered to the trade without announcement of the preservative being used. The best method of preserving cider is to place in bottles in water bath and raise to a temperature of 160 degrees and hold there for 20 minutes. Seal while hot. No preservatives are needed and the drink is absolutely pure.

Cider

Please tell how to make a good apple cider and how to keep it sweet.—Subscriber, San Bernardino.

There are small hand cider mills and presses combined which enable one to crush and press out the juice. The "making" of cider is simply the pressing of the juice from the crushed apples. A chemical preservative is given above. The better method, however, is the sterilizing by heat and bottling. While more expensive this leaves the juice absolutely pure, when it may be sold if desired.

TO MAKE FARMS PROFITABLE

To help California farmers find out how to make their orchards and ranches more profitable and how to make the most of farm and community life is the object of the annual farmers' short courses as announced by the University of California for the university farm at Davis from October 4 to November 12, 1915.

The University of California has decided upon the novel plan of announcing exactly what will happen at every hour of every day throughout those six weeks, so that farmers who go to Davis for practical work may attend exactly those lectures and demonstrations which hit their own particular needs.

Before leaving home, for example, the prospective student will know that on the afternoon of November 2 he can practice under the direction of Professor G. H. True the judging of dairy bulls; that on the afternoon of October 21, Dr. F. M. Hayes will show him how to vaccinate swine to prevent hog cholera; that on the afternoon of October 18 Professor A. V. Stubenrauch will discuss how neighbors may cooperate for fruit marketing; and that on the morning of October 14 Professor R. L. Adams will tell how to economize and eliminate waste on a poultry farm.

There are to be courses in general agriculture, dairy manufactures, poultry husbandry, and in horticulture, including deciduous fruits, citrus and tropical fruits, viticulture, and olives.

The full 779 acres of the university farm will be the classroom for these visiting farmers and their wives. The methods of both dry farming and irrigation will be displayed. Among the laboratory apparatus are a well equipped commercial creamery, a stock pavilion, mechanical shops, four silos, 200 head of dairy and beef cattle, representatives of six breeds of sheep and of milch goats and angoras, half a

dozen different breeds of hogs, 500 varieties of grapes planted in 30 acres of vineyard, 15 acres of almond, peach, prune, and apricot orchards, and 60 acres devoted to experiments with field and forage crops.

All the courses are for six weeks, save that in dairy manufactures, which will last from October 4 to November 24. Applicants for admission must be at least 18 years of age. Women are welcome.

TIMBER IN CALIFORNIA

Timber to the amount of 43,893,000 board feet, valued at \$96,105.02, was cut from the national forests in California during the fiscal year ending June 30, 1915. Of this amount 35,841,000 feet were cut for commercial purposes, 1,274,000 feet were used in the improvement of homesteads and farms, and 6,778,000 feet consisted of dead timber and other material whose removal was beneficial to the forest and for which no charge was made. 3989 separate transactions were involved, of which 883 were sale contracts and 3106 were free permits.

Timber for the improvement of homesteads and ranch property is sold at a rate merely sufficient to offset the cost of administering the sales. In California this rate is 50 cents per thousand feet and 25 cents per cord. Prices for commercial timber range from 50 cents to \$5.00 per thousand feet according to species and accessibility.

RUST PROOF

"Defeating Rust" is the title of a most interesting illustrated booklet published by the American Rolling Mill Company of Middletown, Ohio. The same concern is also putting out Armco-Iron Rust Resisting Products. We believe the great secret of this high grade product, which is claimed to be almost entirely rust proof, is that it is simply pure iron without impurities. "Quality" is the slogan of the Armco people.

These are interesting booklets for anyone who wishes information regarding roofing, siding, tanks, culverts or any form of iron which is subject to rust. We think they will be mailed upon request if the Cultivator is mentioned.

Fits Any
Pump. A
Child Can
Operate It

A Vital Necessity On Every Farm

This Farm Pump Engine should be on every farm, not because of the time, work and money it saves but because of its great adaptability for all kinds of farm labor. This engine will supply from 270 to 2450 gallons of water per hour on the hottest, coldest and calmest days. It will enable you to have all the water you want for your stock, household use and for washing your wagons, farm implements, etc. And in addition, the

Fuller & Johnson Farm Pump Engine

will run your cream separator, washing machine, churn, grinder or any other mechanism that is run by hand power. This Farm Pump Engine runs steadily, easily, without watching and without vibration. It comes to you ready for instant use, there are no extra parts to buy and it can be attached to any pump without extra fittings, special platform or foundation.

Write Now for Interesting Literature

The literature on the Farm Pump Engine describes in detail just what it will do. It shows clearly and briefly how it can save its owner work and money, and the many testimonials we have prove conclusively that the claims of the makers as to what it can do are not only truthful but very conservative.

The Fuller & Johnson Farm Pump Engine is the lowest priced machine of its kind on the market. It is also the only one of its kind made which will give such a variety of long, dependable service.

Write for Literature NOW while this is before you.

Rough Country
and Extra Hard
Soils

"The Ground Hog"

MADE IN 2, 3, 4, 5, 6 and 8 FURROW SIZES

Convertible to 1-Furrow Extra

SOIL NEVER GETS TOO HARD AND DRY FOR THIS PLOW

Plow your land dry. Do not wait for rain. It may not come till too late.

MR. FARMER, DO YOU KNOW that over 1,000,000 California acres were not cropped last season, largely because weather conditions interfered with plowing? Were you among the losers? Don't be caught again. With "The Ground Hog" no matter how hard and dry your soil, you can plow this fall before the rain sets in—insuring big crops. European demand insures you big prices.

BUY A GROUND HOG NOW. It will pay for itself this Season and give you a handsome profit besides.

We manufacture both Horse and Tractor plows. **OUR PLOWS FOR SMALL TRACTORS** work where other plows have been strained or pull to pieces.

**"Jackson
MADE"**

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

Two Promising Holsteins

Prince Albert just does this little old thing:—

Copyright
1915 by
R. J. Reynolds
Tobacco Co.

Constantly, men who have earned their spurs as smokers are being chosen members of the Prince Albert "Old Time Jimmy Pipers Club." Here is J. H. Hill, of 208 W. 82nd Street, New York City, who has known the daily joys of a jimmy pipe since he was 17 years old. Mr. Hill is enjoying his sixty-seventh summer.

It certainly is the brand that's *all there*, no matter *how* you smoke it, *when* you smoke it, or *where* you smoke it! Just puts sunshine into your spirits the whole day long. Can't hardly wait, sometimes, till you can fill up that friendly old pipe or roll a cigarette!

Just you *find out for yourself* that Prince Albert excels, in flavor, coolness and all-around smoke-joy the most cheerful thought either we, or its most enthusiastic friends, could express.

Buy Prince Albert everywhere in toppy red bags, 5c; tidy red tins, 10c; handsome pound and half-pound tin humidors—and that classy pound crystal-glass humidor with sponge-moistener top that keeps the tobacco in such fine condition.

R. J. REYNOLDS TOBACCO COMPANY,
Winston-Salem, N. C.

puts a jimmy pipe or makin's cigarette into your mouth with a brand-new idea of how joy'usly good tobacco smoke can be! Fire-away any hour of the night or day with P.A., it's so good, so cool, so full of kindly flavor and fragrance. The patented process takes care of that—and *cuts out* bite and parch. Quick as you can, you get some

PRINCE ALBERT

the national joy smoke

Mathews Reversible Twin Disc Plow

THIS is the only reversible disc plow which does not use segments to fix the position of the disc, and is therefore the only one which will always plow the same width of furrow both ways on level land and hillsides—and stick to the work on hillsides.

It leaves no water furrows. Discs are fixed in exactly the same working position every time the plow is lowered. Two discs wear twice as long as one—but cost you no more.

We are general agents for a complete line of Disc plows. Glad to tell you about them at any time.

Implements, Wagons, Dairy Supplies, Road and Grading Machinery
217-219 E Market St., Los Angeles

International Motor Trucks

THERE is one advantage in using an **International Motor Truck** that fruit growers and truck farmers are likely to lose sight of. The truck, traveling faster than horses, brings about one important economy.

Twenty to forty miles of daily travel, with the necessary stops, keep the horses and driver busy all day.

With an **International Motor Truck** the driver can start later in the morning and pass every horse-drawn rig on the road. He'll be back early and can put in the best part of the afternoon at productive work on the farm. That gain is enough to make a motor truck pay.

The driver's time on the road is an expense, his time on the farm a profit. An **International Motor Truck** saves you this expense and gives you this profit.

This is only one of many reasons why every fruit grower or truck farmer should use an **International Motor Truck**. Drop us a line and we'll send you more reasons and full information. One of our three trucks—a Model "M," for 1,000-lb. loads, a Model "E," for 1,500-lb. loads, or a Model "F," for 2,000-lb. loads—will fit into the conditions of your work. A post card to us may save you many dollars of expense. Send it today.

The Outlook for the Olive

An Address by B. B. Meek at Fruit Growers' Convention, Palo Alto

BRIEF consideration of the olive industry in California, past and present, will assist in the intelligent consideration of its future. It is interesting to note that it was during the stirring days immediately preceding the American Revolution that the olive, the historical emblem of peace, was first introduced into California by the early Spanish fathers. Many of the olive trees planted by them in their mission gardens are still alive and producing bountiful crops. From these trees was propagated the most popular variety of pickling olive we have today, that known as the "Mission." Surely to these gentlemen we owe a deep debt of gratitude.

But it was not until about a generation ago that there occurred an awakening as to the commercial possibilities of olive culture, and then, in many parts of the state, stimulated by nurserymen and promoters, a large acreage was planted. Little or no care was taken in the selection of varieties, with the result that when these orchards reached a bearing age many of them were found to contain almost all known varieties of olives, pickling varieties, oil varieties and varieties good for neither purpose.

Again, soil and climatic conditions were not given due consideration. Many groves were planted in the coast regions where the moist atmosphere encouraged scale and where the yield was found to be irregular. But oil was made and green olives pickled and the commercial history of olive culture in California began. However, it is doubtful if the oil and the green pickled olive could ever have placed the olive industry on the horticultural map of California. It remained for the pickled ripe olive to revolutionize the industry and to give to California a climatic corner on a new and delicious form of a food famed for centuries in the Old World for its nourishing and healing value.

Long years of tedious experimenting for a pickling process that would retain in the ripe olive its rich, oily flavor, preserve it indefinitely for Eastern shipment and not destroy its beautiful, deep purple color, were followed by long, trying years of discouraging and costly attempts to educate the people to its exceptional food value and to introduce the delicious product to the markets through the country; but so well done was the work of these pioneers in the building of this industry, and so meritorious their cause, that today the gospel of the California ripe olive is being spread by enthusiastic food experts, by physicians and by magazine writers throughout the entire civilized world.

And thus, while the introduction of the ripe olive began only a few years ago, the expansion of the market has

been phenomenal. The early promiscuous planting served the purpose of disclosing the best commercial varieties and of determining the ideal soil and climatic conditions.

More recently a great improvement has been made in cultural methods. It is now an established fact that the olive tree responds well and continuously to good cultivation, to regular irrigation, to consistent pruning, and to the application of suitable fertilizers in adequate quantities and in proper season; and that if it be cultivated negligently or not at all it will not bear remunerative crops. It is known that the olive in a state of nature is not exacting in respect to soil; it establishes itself on the sides of mountains, among clefts of rocks and amid loose stones scarcely less

In the coast regions of California subject to the fog and cool sea breezes the tree is generally diseased, the yield irregular and the fruit of poor quality. A dry, warm atmosphere is absolutely essential.

It is unwise to plant olive trees in any region where the temperature often falls below 20 degrees. The olive tree has survived a temperature of 10 degrees in California, but the fruit may be injured by a fall in temperature to 28 degrees. This tends to render unprofitable the growing of the olive in localities where the ripening season extends into the later winter months. Thus the climate restricts the district available for olive culture.

In soil, climate and varieties the experimental stage has been passed

olives than when they were younger. And in Europe and Asia the trees are still producing at the remarkable age of several hundred years.

Besides its wonderful longevity, the olive is remarkably free from pests, in fact, entirely so in portions of the Sacramento valley. With consistent care it is a regular and prolific bearer. Another important feature is that the entire crop can be utilized. Fruit too small for pickles and frozen or otherwise damaged fruit can be used for oil and other by-products. As a delightfully healthful, nourishing food the ripe olive cannot be surpassed, and the number of uses to which it can be successfully put is constantly increasing, as a substitute for the indigestible mushroom for instance.

The development of the market has hardly been begun. To illustrate this: If New York City ate as many olives per capita as the little town of Oroville does, California with its present acreage could not supply this large center long.

And lastly, but of prime importance, an olive grove is a sure, consistent, everlasting revenue producer, and is indeed, as the old Spanish proverb has it, "A gold mine on top of the ground."

However, if the olive industry in California is to gain the important place it logically deserves: First, the state must do for the olive what it has done for other fruits, establish an experimental station and experiment in pruning, fertilization, cross-pollination, etc., and for larger sized and earlier ripening fruit. Second, oil must be considered as a by-product only. Third, the growers must give their orchards better and more consistent care, thereby increasing the proportion of good quality pickling fruit; and the prospective growers must plant proven varieties, in proven districts, according to proven methods. Fourth, the market now so undeveloped must be enlarged to keep pace with the increase of production by standardizing the pack, by a co-operative and consistent campaign of advertising, and by a systematic campaign of education as to the diversified uses of the olive and its by-products. Fifth, for the past three years perhaps we have been trying to strangle the goose that lays the golden eggs by cramming tasteless green olives down its throat. This year's carry-over stock is largely the result of this short-sighted and unfortunate policy, and therefore above all the growers and packers must combine to the end that ripe olives and ripe olives only are pickled and the pickling of green olives sold under a ripe olive label forever stopped.

Upon the ripe olive, how it is grown, how cured, and how marketed depends the future of the olive industry in California; and the olive industry can become one of the biggest and most important fruit industries in the state.

well than in the richest and best watered of garden soils. But when it comes to the cultivation of the olive for profit, conditions of climate, soil, irrigation, tillage and fertilization have to be carefully studied.

It has been demonstrated that the olive will thrive best in a light, friable, well aerated, warm, and well, but not necessarily deeply, drained soil, rich in lime and potash content, and that it will yield scanty crops of fruit of poor quality in heavy, clayey or ill-drained soils. The olive requires less water than many other trees on account of its sparse foliage and strong root system. It will not, however, produce heavy yields in a soil lacking in moisture. Excepting in rare cases monthly irrigation during the dry season is necessary for big fruit and regular yield. This must not, however, be excessive, and the water level must be kept low, otherwise the quality of the crop will be inferior, the yield irregular and the tree subject to disease. In many rich, loamy soils, a good tree growth can be obtained without irrigation, but inequalities and intermittency of yield, to which the olive is subject under certain conditions, make the growing of the product unprofitable in these localities.

and the olive industry occupies a peculiarly secure position.

There are approximately 25,000 acres of olives, bearing and non-bearing, in California. This is only a small fraction of our acreage in peaches, prunes, apricots, apples or oranges, and these products are grown in other states and in other countries throughout the world, while California produces practically the entire world crop of pickled ripe olives; and on account of the combination of climatic and soil conditions, the future production of the pickled ripe olive commercially, will practically be confined to California.

There are thousands of acres of land in the foothill sections of Northern and Central California where climatic and soil conditions are ideal for olive culture that would not grow any other product profitably.

And olive growing is especially attractive for many reasons. The olive is the only fruit bearing tree whose producing qualities do not deteriorate with age. In fact, they appear to increase as far as we have any record. Many olive trees in California which are known to have been planted more than 100 years ago are today producing a larger quantity of better

Bean Giant Power Sprayer

The Power Sprayer for Large Orchards. For downright dependability—efficient work—high pressure—ease and economy of operation—low cost of maintenance—strength—durability—and all round satisfaction, the Bean Giant is in a class by itself. Supplies 2 to 4 lines of hose and has a capacity of 7 to 12 gallons a minute. Good for 4 to 8 acres a day.

Thirty years' experience in the building of spray pumps is back of this outfit.

Built Complete Under One Roof

Every part is produced right here in our own factory—with the exception of the Novo engine and we use the Novo because we can't build a better sprayer engine.

TWENTY-ONE DISTINCTIVE FEATURES are incorporated into the making of the Bean Giant—Patented Pressure Regulator, Porcelain-lined Cylinders, Rustless Ball Valves, Bean Patented Refiller, Truck with Rocking Bolster, One-piece Steel Frame, and many others.

We manufacture a complete line of smaller power sprayers and hand pumps. Before you invest in any kind of a Sprayer, write for

DEVELOPMENTS IN THE STUDY OF THE DATE PALM

Written for California Cultivator
By Paul Popenoe, Author of
"Date Growing"

ALTHOUGH Arabs have been cultivating the date palm since the dawn of history, they have made no progress in the last 4000 years. Records which have come to us from the time of King Hammurabi at Babylon in the twentieth century before Christ show that the cultivators of his day were able to secure better results than are their descendants in the same region at the present day.

During the last twenty years, however, Americans have taken up the cultivation and study of the date palm and are rapidly developing it along the lines indicated by modern botany and agriculture. A method for rapid propagation of offshoots and methods of artificially ripening the dates are perhaps the two most notable contributions so far; but a third of much importance is foreshadowed in the attempt of Professor Silas C. Mason of the United States department of agriculture to rationalize and tabulate the means for identifying the various varieties of palms.

The experienced grower can distinguish his palms, just as the experienced rancher in other fields can distinguish his varieties of apples or oranges, by the appearance of the tree. He depends on many small indications which he almost never takes the trouble to describe accurately to himself. But if these indications exist they must be capable of description, and Professor Mason, with tape measure and protractor, has undertaken to do this for the palms of the Southwest, publishing the first results of his study in bulletin No. 223 of the United States department of agriculture.

The date palm is very formal, even geometrical, in most of the details of arrangement of its parts. Professor Mason has been able to take advantage of this fact in describing the characters of value in identifying varieties. Most of these characters are found in the leaf, and the professor thinks that when standards have been established a series of measurements on two or three leaves of any palm will suffice to determine its variety. "It is not to be supposed that date leaves are so perfectly laid out along geometric lines that we have but to read a set of angles, refer to a table, and say 'This is Thoory' and 'this is Hayany,'" he warns us. "But it is true that certain ranges of angles are found only in certain varieties, and along with other characters are important factors in identification."

He therefore presents the results of his study of what he considers the four most important varieties in the Southwest at present; namely, Deglet Nur, Thuri, Hayani and Manakhir. No doubt the formulae for other varieties will be worked out and published in due time.

It must be said that the procedure is very complicated and is not likely to be followed in any case by the average rancher, particularly as it involves the use of a large number of technical

words which to most people carry no meaning. But for the serious student of date growing it offers much promise.

In the second place Professor Mason thinks that this system will be of value in the study of seedling palms, some hundreds of thousands of which now exist in California and Arizona. "It seems to be a good working hypothesis," he writes, "that there is a close correlation between the leaf and fruit characters of the date tree." If this is the case, and we know the leaf characters for a given variety—Deglet Nur, let us say—then all we need to do is to measure a bunch of Deglet Nur seedlings, and by picking out those whose leaf measurements most nearly approach that of the parents, we will be able to point them out as the ones which are most likely to produce fruit that nearly resembles the typical Deglet Nur.

This obviously will permit one to form some estimate of the value of a seedling before it comes into fruit—provided the method proves, in practice, to be reliable. It is at present a hypothesis without much foundation in actual experience.

Still a third important use of the method of measurement is suggested by Professor Mason. If the characters of the leaf give some clue to the characters of the fruit, then when we want to produce seedlings we should look for a male tree which measures the most nearly to the standard of the tree which we intend to use as a female parent. Cross-pollination from such a male ought to give seedlings

with less variation than would the use of a male picked at random.

This again is an untested hypothesis which needs much confirmation. Although it is of great interest, it is doubtful to me whether production of dates from seed will ever be an important branch of the industry, under any conditions.

The principal defect in Professor Mason's very suggestive bulletin is the total inadequacy of the statistical methods he has employed. The problem of establishing standards for the various varieties is in effect the problem of studying the variation of certain characters in the palm. Now the study of variation is a branch of the science of genetics (heredity) which has been worked out with great elaboration and precision during the last quarter of a century. It now offers methods of extreme refinement. Professor Mason not only ignores these methods, but in many cases follows methods that even genetist must consider almost worthless. His averages appear to be based on very small numbers, eight being the largest number he mentions. Averages of this sort are of little value, particularly as he fails in every case to give the series on which he based his average, or to work out any of the well known mathematical tests to their correctness. Without such data we have really no means, except our confidence in Professor Mason, for judging whether the results he reaches are of any value or not. It is to be hoped that in some future publication the professor will lay before us the data on which his conclusions are based.

Furthermore, although he speaks several times of correlations, or "a strong correlation," he nowhere publishes a single correlation and does not even give any indication that he has worked out a single one of these correlations. Here is a defect that can easily be remedied but, until it is remedied, exists as a serious blot on the statistical side of his work.

Again, some of the characters which he measures seem to be of doubtful value for his purpose. Thus in taking from his table the thickness of the leaflets of five different kinds of palm, we find that four of them offer so little difference in measurement that it would be impossible to use that character with any certainty as a clue to identity.

Finally the bulletin is marked by a great many mistakes in the spelling and use of Arabic words. These do not impair the value of the main work, but they are confusing and appear to me unnecessary. I will point out only two cases of this, which are words that he apparently wishes to introduce into the date vocabulary of the American growers—"sobata" and "shamrukh." He appears to have been misinformed as to the meaning of both these words, and consequently uses them wrongly in his diagram. The proper spellings for them are "subatah" and "shumrukh." The former is particularly objectionable, as it is not even good Arabic, but found only in the vulgar and corrupt dialect of Egypt. I do not think American growers want to assimilate many Arabic words of this sort; but if they do, more care should be taken than has been done in the past that the words offered are properly spelled and, most of all, properly understood and applied.

Despite these flaws the bulletin must be considered to mark a step of great importance in the study of the date palm. Date growing is making large strides from the commercial point of view in the Southwest and is certain to make immensely larger

ones during the next decade. It is gratifying to us to think that the scientific aspect is going to keep pace with the commercial aspect and that from now on the Old World will have to look to the New for its knowledge of the finer points of this ancient industry.

NEW TABLES FOR FUMIGATION

Waste and inefficiency in fumigating fruit trees are going to be lessened by a new publication of the University of California.

What doses to use in fumigating fruit trees is set forth in this bulletin, entitled "New Dosage Tables." Written by C. W. Woodworth, professor of entomology in the University of California, it has just been issued by the university and may be obtained free by addressing College of Agriculture, Berkeley.

The tables commonly in use heretofore are now shown to be grossly inaccurate. Trees higher or lower than the ordinary orchard tree have been getting much weaker doses in fumigation than they ought to have had. The new tables help the fruit grower to set the matter right.

That the most important improve-

ment needed in fumigation practice is the general adoption of correct allowance for tent leakage is declared by Professor Woodworth. These tables help to solve that difficulty.

The tables in use in the past were practically sound for medium conditions, but with orchards where trees are either unusually large or unusually small, the new tables will help toward a great increase in efficiency and economy in fumigating.

CALIFORNIA RIPE OLIVE ASSOCIATION

Scores of olive growers representing the groves in the vicinity of Lindsay, Exeter, Porterville and Strathmore, one of the largest olive centers in the state, gathered at Lindsay during the past week for the purpose of joining the new California Ripe Olive Association and discussing ways and means of promoting on a more substantial and profitable basis the ripe olive industry. Considerable enthusiasm marked the progress of the meeting, as the olive growers in this section of the state as well as others are fully cognizant of the fact that effective organized efforts are necessary for many reasons, the principal

one being that the growers are finding it more difficult every season to successfully market their crops, despite the fact that they offer to the world one of the most healthful and delightful of California's products, a product which is superior to that of Spain, Italy or Algiers.

R. C. Merryman, a prominent grower of Tulare Co., presided over the convention. Carl T. Worst of San Francisco addressed the growers, taking as his theme the marketing and selling of the product. He said: "While the consumer is paying a uniformly high price for the ripe olive as a luxury the grower is hard pressed at times to get even his cost of production out of his crop. The remedy lies in making the ripe olive known to the Eastern housewife as an article possessing high potential food values, getting her to demand it as a food and at food prices, then let the grocer, wholesaler, broker and packer make a food profit out of their work so that the grower can get a real profit by reason of a standardized price."

Other speakers were G. V. Reed, W. B. Kigans and R. L. Underhill, secretary of the association. Similar meetings will be held in other districts in the near future.

Still Better Tires

Sizes 30x3½ and 30x3

Small Goodyear Tires Enlarged 20%

Lower Prices, Too

Goodyear started this year—on February 1—with another big price reduction. It was our third in two years, totaling 45 per cent.

This last reduction saves Goodyear users about \$5,000,000 this year. Thus, as output multiplies, we give you more for your money. For years Goodyears have been the largest-selling tires in the world.

Now a New Design

But we also found in the past year a new design which adds endurance to small-size tires. So we changed every mold for sizes 30x3 and 30x3½. The cost was \$63,000.

In making this change we added 20 per cent to the air capacity. A larger-size tire means extra mileage, you know.

And we added 30 per cent to the rubber in the side walls, just above the bead. That's to combat as never before a common cause of tire ruin—the breaks near the rim-top due to constant flexing and chafing.

These additions will cost us \$317,000, just on this year's small-tire output.

For a Million Users

At least a million cars now use these small-size tires. We want those users to find in Goodyears the greatest value known in Tiredom.

They have found it for years, as shown by Goodyear's place. No other tire ever won so many users. We have given them, even in size 30x3, a sturdy four-ply tire. And our anti-skid tread—the Goodyear All-Weather—has always been double-thick.

Now we add 20 per cent to the air capacity. We add 30 per cent to the side-wall strength. So this year, despite lower prices, you are getting tires that are much better.

Compare these new Goodyears with other small-size tires—even with last year's Goodyears. See for yourself the extra mileage they give you. It is bound to excel, on the average, any previous records on tires of like rated size.

Every neighborhood has its Goodyear dealer with your size in stock, and who renders full Goodyear service. For your own sake find him out.

Cheaper Money Not the Only Aim of Rural Credits

An Address by Myron T. Herrick at the Panam - Pacific International Exposition

HE rural credits movement has two features: One is real estate mortgaging; the other, cooperative banking. The first depends largely upon money obtained in the open market; the second, upon the farmers' own money. In the United States farm mortgaging is unsatisfactory to both investor and borrower, while the farmers have never utilized their own credit collectively for any purpose.

The movement's aim is not centered on the reduction of interest rates; it rises higher than that and proposes to enable homeseekers to accomplish their wish, landowners to procure adequate funds to develop their holdings, and farmers to mobilize their resources so that American agriculture, become modernized and properly financed, may keep pace with the progress in every other industry, bring better prices to both producer and consumer, and perpetuate prosperity in this nation: Those who have overlooked all this, and talk only of lower interest rates, have belittled the grand purpose of the movement.

During the five years that this movement has been in course, the entire country has been thoroughly aroused to the importance of it. Those of us who have been with it from the start have the proud satisfaction of knowing that it has been indorsed by two presidents and is supported by the great majority of the people. We are confident that it will continue to be a living issue until all its problems are settled. Some results, good, bad, and indifferent, have already been achieved. The mortgage business has benefited by the attention attracted to it, and money is flowing in an ever increasing volume to the farm, while legislation has been enacted in seven states on the cooperative so-called unions, and in ten states on land-credit institutions. This legislation, however, has little merit.

Unfortunately the movement has been rived by a serious cleavage, and on one side stand those who insist upon state aid, and on the opposite stand those who believe in private initiative and cooperation. The demand for state aid in farm mortgaging is very strong.

California has adopted a resolution to let the people vote on amending the constitution so as to permit the state to use its cash and credit for farmers.

Indiana, New York, Wisconsin and Utah have involved the credit of the state in farm-land credit by laws which require the state comptroller or auditor to serve as trustee for the bondholders of mortgage associations. New York has throttled competition by making this the exclusive right of one highly privileged and monopolistic institution.

Kansas has authorized the deposit of farm mortgages with the state treasurer and the issue against them of bonds whose value shall be certified by the state.

Louisiana has authorized the exemption from taxation of land improved for homesteads by or for immigrants.

Missouri enacted a law for creating a public land-credit bank. Doubts as to the constitutionality of the law prevent this bank from being formed.

The tendency in the last Congress

towards state aid was exceedingly pronounced. Practically all the measures introduced provided for it to a greater or less extent, while those that received the most attention proposed its use for farmers generally to a degree that appears in Europe only for the lowest class of peasants. About one-half billion of dollars was demanded for cotton growers, while cheap money without limit through government intervention was demanded for farm mortgaging. After the senate passed the McCumber bill and the house the Bulkley bill for this purpose, congress created a joint committee on rural credits to present a new bill by January 1, 1916, and there the matter rests.

The advocates of state aid cite as their arguments this use of state aid in some European countries, the critical situation arising from the great war, and the indifferent or alleged antagonistic attitude of financiers towards farmers. On the other hand, the friends of private initiative and cooperation assert that conditions in Europe and the United States are dissimilar and that there is no emergency here calling for the use of government cash or credit. They cite as their arguments the official declarations of President Wilson, Secretary Houston, the United States and American commissions, and other experts against state aid, and they contend that if proper legislation were enacted and rural cooperative organization perfected, the credit of land owners and the resources of farmers would be so vitalized that abundant capital would be available on easy terms for the cultivation of the soil and the continual advancement of agriculture.

The strongest argument for state aid is the claim that there is a pressing, immediate necessity for it. If that claim is wrong, or if any necessity that exists should disappear, then the demands for state aid ought to cease with it. State aid—after saying the most that can be said for it—is merely an expedient to meet an exigency, the existence of which is as stoutly denied by some people as it is asserted by others. Furthermore, it is advocated without fully considering its effect on the taxpayers not intended to be directly benefited, and without a thought of testing and letting the ordinary means of farm finance have a chance to show their worth.

The arguments for state aid are based on premises, the correctness of which can be logically proved, of course, only by future trial. In my opinion there is not an advocate of it but believes in his heart that the injustices he condemns and the troubles he mentions would be remedied, if private enterprise could be efficiently regulated and rural cooperation intelligently practiced. So in studying the question, we must consider the possibility of making these latter methods effective. They are more effective in Europe than the much heralded state aid and are more generally used than it. They rest upon individual honesty and capability. No one in this hall will maintain the superiority of European over American people in these two qualities. Indeed, we all think that the comparison runs in our favor; so if we should say, in spite of the wonderful agricultural organizations developed through private enterprise and cooperation in Europe, that such development is impossible here, the assertion is tantamount to an admission of inferiority, or an absurdly illogical deduction that American financiers and farmers cannot do what lesser peoples in Europe have accomplished to a remarkable degree of success.

Both factions in the movement agree that in land credit the greatest need, next to an adequate flow of capital, is the repayment of loans at fair interest rates and by small installments running through a long series of years; that is, that farmers should

have the right to borrow on mortgage, not through three and five-year promissory notes (as at present), but through thirty, fifty or seventy-five year annuity contracts so that they shall not be required to pay off their debt any faster than they can recover it from the yearly savings from the soil. The long-term loan reducible by periodical payments, or annuities, is the only safe way to finance the purchase or improvement of land, yet it has never been tried in the United States for farmers, although there is no railroad that bought a right of way, no city that acquired a park, no private enterprise that erected a great plant that did not obtain by prior stipulation this method for the retirement of its obligations. True, in most of such cases the repayments go into a sinking fund that is maintained intact for a certain time; but this does not alter the fact that the refunding comes from annual earnings. The principle remains the same, and the only difference that arises in its application to land-credit institutions, properly managed, is that the sinking fund (created by the yearly dues of borrowers) must ordinarily be distributed among bondholders, likewise annually, so as to prevent the accumulation or misuse of idle funds.

The mortgages on American farms now approximate two billions of dollars, and run from three to five years. All will not be repaid within that time; many will be foreclosed, many others will be renewed and the greater bulk will remain on record with the burden increased by fees, commissions, and various charges. If long-term facilities were available, this stupendous debt could be converted into annuity contracts and finally extinguished by yearly instalments so small that they would not exceed the present interest rate; foreclosure would be less frequent; farm mortgaging would lose its most formidable aspects to the borrower; and many a tenant and homeseeker could become a land owner by the easy process of setting aside a portion of his annual returns for paying off the indebtedness contracted in acquiring or improving his home.

But present land-credit facilities are inadequate not only for long-term lending, but also for farm mortgaging generally. The trouble lies mainly in defective laws. In some states the proving and establishing of titles to real estate are difficult; in others, foreclosure is slow and costly. A mortgage loan at best is a tedious investment, and throughout the United States it usually requires the services of a lawyer in obtaining and often a resort to the courts in recovering it. The state laws are dissimilar, and only experts are able to advise investors of their rights. All this involves risks, delays, and expense which increase interest and other charges far in excess of the normal rate for loans made in regions not in close touch with financial centers.

The farm mortgage will never be an effective instrument for leveling interest rates and starting an easy flow of money to all parts of the country until it becomes a standardized, marketable security. This requires that the rights under the mortgage shall be certain and sure and the same in California as in Maine, and so on for all states. Consequently it is highly important that the state laws be made uniform as well as effective for securing and recovering claims. The need of this uniformity and certainty should be kept in view whether farm mortgaging in the future shall be state aided or left to private enterprise. A government institution would not be in any better position than a private company unless it have cheap, easy, and certain means for making, securing and recovering its investments.

So the first step in the reorganization of land credit naturally would be a revision (wherever necessary) of state laws relating to mortgaging. Some states already have excellent laws that need no changes. In a number of western and southern states, however, the laws are objectionable, while everywhere legal obstacles are presented to long term lending. I will try to explain this abstruse problem. A long term loan is represented, not by a promissory note, but by an annuity contract—an agreement of the borrower to pay equal sums annually during a stipulated period. Such a contract may, of course, be easily entered into, but

what may be done with tenders of partial payments on it? Clearly they cannot be applied in the ordinary way for reducing the size of the loan, as with a promissory note, because (in theory at least) the transaction has ceased to be a loan and has become an obligation to pay an annuity. The lender has bought the contract and taken a mortgage to secure it; the sum lent is, in fact, the price paid for that contract, while the yearly dues of the borrower are the income that he agrees to give to the lender for that consideration.

Now, suppose that the borrower, wishing to clear off part of this obligation against himself and his mortgaged property, tenders some money for that purpose, what may be done with that money? Two things only; it may be applied to reduce the amount of his annual instalment, or else to increase its size and shorten the period of his contract. In some European countries, however, a borrower may also have the money applied for extending the period beyond the original term, with the annual instalment left unaltered; or, after the contract has run without default for a certain number of years, he may even obtain a readjustment that would change it in both amount and period. But, in spite of any of these alterations in the original contract, the mortgage would remain as a valid lien on the property against the rights of third parties.

In the United States, however, an alteration of the original contract through applying prepayments in any of the ways I have indicated might seriously affect the lien of the lender under the old mortgage, if in the meanwhile rights of third parties had been attached to the mortgaged property. Under existing laws, the lien certainly could not be extended beyond its original terms against intervening third parties. Moreover, some lawyers go so far as to contend that, inasmuch as the borrower's agreement to pay a series of annuities constitutes one single contract, any material alteration in that contract, either as to amount or period, would convert it into an entirely new contract and invalidate the old mortgage. If this be true, then the lender would have to take a new mortgage at every alteration of the original contract, while he would have to refuse tenders of prepayment altogether, if third parties had acquired any rights.

If a new mortgage had to be taken, this would necessitate re-examination of title and various other acts, involving more or less expense, at every part prepayment. This expense would have to be borne by either the lender or borrower. Prepayments would become troublesome; a rearrangement in the event of a default would also make extensions or renewals equally troublesome. So, if these objections of the lawyers be tenable, the borrower could not be accorded the option of making prepayments, while the lender could not safely show any leniency for defaults; the contract of the long term borrower (when once entered into) would be unescapable and unalterable, all payment in advance would be impracticable, and the lender would be under the necessity of foreclosing upon the non-payment of just one annuity. Besides these difficulties which militate against renewals and the acceptance of partial payments, there are others arising from the absence of statutory provisions relating to taxation and registration that interfere with the proper execution and releasing of long term mortgages. All this makes long term lending a somewhat complicated problem under the laws at present.

I have tried to mention only enough to show that the troubles with land credit in the United States are deep-rooted; they lie in the bedrock. The creation of land credit institutions before removing these troubles would not alone suffice. A reorganization (to be thorough) must undertake as its first step the revision of state laws wherever necessary. Unless this be done, the reform would be deceptive, and no institution, whether formed with a federal or a state charter, would be able to operate in an entirely efficient manner. A superstructure erected upon the present faulty base would be fragile and unreliable, no matter how elaborately it should be built by either state aid or private enterprise.

(Continued Next Week.)

"No more bran or shorts for me as long as I can get Larrowe's Dried Beet Pulp"

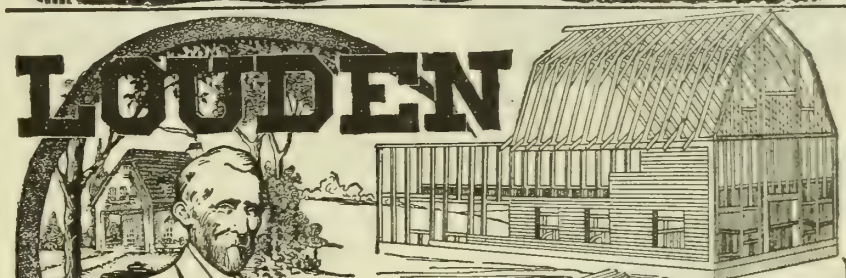

—that's what MR. A. L. HARTMAN of Chehalis, Wash., says in a recent letter.

Hundreds of other dairymen have also found that wheat bran is no longer a necessity or even an economical feed—so long as they can get dried beet pulp. A ration composed solely of alfalfa and Larrowe's Dried Beet Pulp provides not only the correct proportions of protein and carbohydrates but in addition thereto, an abundance of succulence and bulk.

Larrowe's Dried Beet Pulp is clean, wholesome, appetizing; aids digestion; contains five times as much nutriment as silage with as great or greater succulence—swelling to fully six times its original bulk when moistened. It will not only increase the quantity and quality of milk, but keep the herd in better health with less bag trouble and greater contentment. Try it now. Go to your feed dealer today and buy one sack, either plain or with molasses. Test it on one cow whose milk record you know and watch results.

Our booklet—
"PROFITABLE FEEDING"
gives valuable information and feeding instructions. Should be in the hands of every dairyman. Write for a copy—free.

LOUDON

BOOK OF BARN PLANS FREE

If You Intend to Build a New Barn or Remodel an Old One You Should Have This Book

Louden Barn Plans is not a catalog of barn equipment. It is a complete and valuable book of reference and instruction on barn construction.

The 96 pages of Loudon Barn Plans are full of dollar-saving information. It contains 51 representative designs for cow barns, horse barns, combination and general purpose barns, as well as many other designs for hog barns, pens, hay sheds, chicken houses, etc.

In addition to the barn plans shown in the book, there are 32 pages devoted to general construction problems, such as concrete work, laying floors, roof construction, ventilation, etc.

When Writing for This Book Please State When You Expect to Build, and How Many Cows and Horses You Want to House

We have designs for nearly 4,000 barns, and our architects will give your letter personal attention if we learn your exact requirements.

Louden Barn Equipment

Louden equipment makes possible a clean, sanitary barn with a minimum of expense. When cows are transferred from dark, dirty barns to Loudon barns the milk flow often increases from 15 to 25 per cent, and the labor of caring for the herd is reduced from one-third to one-half. Loudon equipment is just as great economy for the man with a half dozen head of stock as for the man with hundreds of animals. The percentage of labor saved is the same.

The Loudon Line of Sanitary Steel Equipment Includes:

Litter Carriers	Cow Stalls	Hay Loft Equipment	Sheep Pens
Feed Carriers	Horse Stalls	Cow Pens	Water Basins
Milk Can Carriers	Mangers	Calf Pens	Bird Proof Barn Door
Harness Carriers	Manger Divisions	Bull Pens	Hangers
Hay Carriers	Feed Racks	Hog Pens	Power Hoists and
Feed Trucks			Other Barn Specialties

Flower Garden

THE CALIFORNIA GARDEN

Written for the California Cultivator
By Ernest Brauntton

HERE is no question but we are coming to it—the true California garden—one that needs no water, food, pruning, or other care throughout our long dry summers. Not only have I long predicted but advocated and longed for it. Incidentally I have built several of it (for other people).

In no country are there more native plants than would lend themselves to such a scheme. Trees, shrubs, herbs, vines, even showy water plants that would grow in a stagnant pool throughout the season, are not wanting in considerable numbers, in all parts of the state. It is not alone possible and advisable but most commendable to build such gardens. We should have them on every hand for, considering amount expended in upkeep they will surpass in attractiveness any gardens we may build.

The Resourceful Gaillardia

While one is looking about for plants that will bloom throughout summer without being watered do not overlook gaillardias. They do not come in a great range of colors and are somewhat coarse in both flower and foliage but they will bloom from spring to fall without irrigation and the blooms will be fairly satisfactory in both size and number. If in a border plant arctotis back of them and gazanias for an edging or low border in front. Both these are dependent on sunshine to open.

Mealy Bugs a Pest

In my garden at present the mealy bug pest is a serious one, being quite bad on crinums, clematis and the Chinese rice paper plant (Fatsia, or Aralia). This is not the citrus mealy bug for there are citrus trees in all parts of the garden yet none are infested. I have had some success in treating the infested parts with air-slaked lime, covering the nests and congregations freely but there should be a speedier and deadlier treatment meted out, and I presume Essig's spray would prove effective. Mix water, ten gallons; whale-oil soap, ten pounds; crude carbolic acid, one gallon. Bring the water to the boiling point in an iron kettle, dissolve the soap in it, then add the crude carbolic acid and heat to the boiling point for fifteen minutes. This will give you a thick stock. Dilute any quantity of this with twenty times as much water and spray any time from now to March. Two or three sprayings may be necessary to destroy all the insects.

Cut Shasta Daisies

Shasta daisies now have stopped blooming and the old flower stems should be cut away down close to the plant. Cut each stem by itself; do not try to do the job on a wholesale plan. It is likewise a good time to divide or replant these daisies. Tops of perennial phlox should also be removed now and this will be found true of much in the garden at present. I am taking up gladiolus bulbs and I notice that new shoots on callas are pushing up, wherefore I am cutting away all the old leaves. I find all over the gar-

den that nature is suggesting a clean-up of old tops of many plants.

For Native Flowers

It is not too early to prepare beds for that wild-flower garden. Spade it up good and deep, using some well-rotted stable manure to keep it loose. Water well and start the weeds. Hoe these down and repeat treatment. When all the weeds have started and have been destroyed it will not only be safe to sow native flower seeds with assurance of success but the best time will have arrived. Start at once.

Shape Trees and Shrubs

Many trees and shrubs are so heavy with an abundant, summer-made top that when hanging heavy with the weight of winter's rains they will sure split unless lightened by pruning. The present is a good time to do this necessary pruning for wounds will start to heal over before cold weather comes on. Many trees in both garden and street parking will have their fine appearance and balance preserved if this matter is now attended to or will be partially or wholly ruined if neglected until rain and wind have expended their force upon them.

Yellow Callas

During the past few years the yellow calla, known as Richardia Elliottiana, has steadily gained in popularity until it has become a standard in trade circles. In light soil more especially does it thrive, blooming abundantly, and increase by offsets. In heavy soils the bulbs perish during the rainy season and in light soils they deteriorate to such an extent that the following season's blooms are not fine, so it is best to remove bulbs each year and this is an easy matter for, unlike the common calla, the yellow one is not evergreen.

WATERING THE LAWN

This is a matter which can be most effectively and economically done by considering the water requirements of the grass most commonly used in the formation of lawns, Kentucky bluegrass. This grass is neither an aquatic nor a desert plant, but may be classed with those plants having medium water requirements. While it is necessary to keep the soil moderately moist during the growing season, it is undesirable to keep the water constantly running on the lawn, as many persons are inclined to do when not restricted in its use.

Too frequent and too prolonged watering tend to make the soil soggy and cause the grass roots to grow close to the surface in order to get air. The same effect may also be produced by frequently sprinkling the lawn, which merely moistens the surface layer of soil, and thus encourages shallow rooting. Such shallow rooted lawns have little or no resistance to drouth, if it comes, and require the most effort and largest amount of water to maintain them. One or two thorough waterings of the lawn each week, so that the soil is well moistened to a considerable depth is the preferable method to employ, and at the same time conserve time and water.—B. O. Longyear, Colorado Agricultural College.

FARMERS' MONTH

The month of October has been designated as Farmers' Month at the Exposition. It is packed full of events which should draw farmers from all parts of the world. Especially does the month hold attractions which will be of interest to live stock breeders. Horses and cattle of high degree will be on exhibition. There will be the shows of horses, mules, jacks and jennets from September 30 to October 13, and of beef and dairy cattle from October 18 to November 1. In these, picked pure bred animals of all the recognized breeding classes will be on exhibition and will compete for cash prizes and trophies presented by the exposition, by a large number of breed record associations, and by various state commissions to the exposition. In all, nearly \$125,000 has been appropriated for the horse show and approximately an equal amount for the cattle show.

Such purses as these will certainly bring as fine as the earth possesses.

Of course during all periods of the exposition there have been exhibitions of agricultural implements. A day or many days may well be spent in the Palace of Agriculture and the Palace of Machinery in the study of the most improved of farm implements, of water-lifting appliances and, in fact, everything of interest to the farmer who would apply scientific cultural methods.

During October there will be a series of conventions of special interest to farmers. Among them will be those of the California Draft Horse Breeders' Association, the American Association of Importers and Breeders of Belgian Draft Horses, the American Shire Horse Association, the California Conference of Boys' and Girls' Agricultural clubs, the Ayrshire Breeders' Association, the American Galloway Breeders' Association, the American Shorthorn Breeders' Association, the American Aberdeen Angus Association, the State Humane Association of California, the Red Polled Cattle Club, the Polled Durham Breeders' Association and the California Creamery Operators' Association.

One feature absolutely new to expositions is the World's Insurance Congress, which will be held in connection with the Panama-Pacific Exposition, San Francisco, October 4-16. Commissioner Hathaway writes regarding this feature:

"Insurance, recognized in this exposition under the head of social economy, is up for public inspection and understanding in the proceedings of the congress, as outlined in the program, which contains many names of national prominence. Your readers are the real interested parties. They are invited to attend the sessions. We believe there is no other way in which

your space could be better utilized to their advantage than by making known to them this invitation and the objects of the congress.

LIVE STOCK EVENTS

Horses, mules and asses, September 30-October 13; cattle, beef and dairy, October 18-November 1; sheep, goats and swine, November 3-November 15; car lots of live stock, November 11-November 14; poultry and pigeons, November 18-November 28; dogs, cats and pet stock, November 29-December 1; children's pets, December 1-3.

The exposition is making arrangements for a great event for the boys and girls. There will be an exposition pet show December 1-3. Chief Lively writes that there will be pets of 100,000 American children on exhibition in the live stock section. The pets will be received on Tuesday, November 30. Any boys and girls interested should write Chief Lively at once. It matters not whether the pets are birds, fish, quadrupeds or even reptiles, Mr. Lively promises the best attention and not a penny to be charged for fees.

Don't neglect a visit to the model post office. A balcony has been arranged so that one may inspect the workings of an up-to-date post office. It is not, however, simply a model for it is the post office for the grounds. Those who may wish to receive mail on the grounds may be addressed "General Delivery, Model Post Office, Exposition Grounds, S. F."

The great Autumn Music Festival will be held in Festival Hall, September 29 to October 3. The events during these few days are said to be the "climax of a wonderful cycle of epoch-making events." No previous international exposition has brought together so many great artists.

The wonderful grounds and gardens of the exposition, with all varieties of rare and exquisite flowers blooming and fountains playing amid splendid groups of sculpturing, will be in the height of their glory in October, a period of plentiful sunshine and no winds or fogs.

Poultrymen are getting ready for a great show. It will be many years before poultrymen of this coast will have another such opportunity. November 16 has been named as American Poultry Association Day or Poultrymen's Day.

The Society of American Foresters will meet on October 18. H. S. Graves, chief forester of the United States government, will be the principal speaker. Hundreds of rangers are expected to be present.

CROPS BETWEEN ORCHARD TREES

Written for the California Cultivator
By Sacramento Valley Contributor

IN regard to the planting of
crops between the rows of
young orchards, the experi-
ence of this season teaches
some useful lessons.

In different parts of the Sacramento Valley many kinds of crops have been planted with varying sorts of care. In some orchards that have been given good care, sufficient cultivation and irrigation, and where there has been a strip of land not planted for five to ten feet on each side of the tree row, intercrops have been grown that will return some revenue, and the trees have made splendid growth. Beans, corn and alfalfa have proven satisfactory under these conditions. The bean and alfalfa crops probably store up some nitrogen for the use of the trees, the roots of the alfalfa particularly, and the beans to a greater or less extent, tend to loosen up the subsoil, and if there is plenty of fertility and moisture available for both trees and intercrop there is no apparent disadvantage in growing something that will make a part of the cost of caring for the orchard. Whether these crops are taking out fertility that will have to be replaced at greater cost than the revenue received remains to be seen. The analyses of some of these rich Sacramento Valley soils indicate that there is sufficient fertility in them to last for a great many years, so that the gain in nitrogen and mechanical condition from the alfalfa might be more than enough to offset the need of phosphorus or potash a hundred years from now. Where intercrops are grown it is not quite so easy to spray and care for the trees as when the land is clean cultivated, but the difference so far as actual cost is concerned is not great.

Intercrops have been planted in other orchards where the trees have been given less cultivation, the moisture supply has been more limited, and the trees have either barely lived through the season or have made very little growth. The loss of growth on the trees has been much greater than the possible gain from the intercrop.

In other places where an intercrop like corn was planted within two or three feet of the tree rows and solidly in the interspace between the trees, and neither the trees nor the corn cultivated or irrigated, the life of a large percentage of the trees has been sacrificed for a crop of corn. The corn is such a gross feeder and has made such a rank growth that it has taken practically all of the moisture available. Moisture being the limiting factor, the trees have perished. It is unnecessary to point out the folly of such a procedure.

There have been instances where the intercrop has been allowed to encroach more closely on the tree rows than was good for the best growth of the trees. It is better to give the trees more room than they actually require than to curtail their growth in any way, because the trees and not the intercrop should make the most money or the trees should not be planted at all.

In a good many orchards pumpkins are planted after the ground has been thoroughly cultivated and irrigated and is practically ready to be "laid by" for the season. There is ample moisture for the needs of the trees and the weeds have been well killed out. One row of pumpkins planted late in June down the center between the tree rows does the trees no harm as far as moisture removal is concerned and makes a lot of good hog feed.

POTATO GROWERS' MEETING

THE state commission of horticulture, together with W. V. Shear, expert connected with the department of agriculture, have been hold a series of meetings or institutes with farmers in various potato growing sections. These meetings have been held in Bakersfield, El Monte, Perris, Salinas and Stockton. The attendance has been only fair, which is much to be regretted for the addresses of Mr. Shear and Mr. Weldon were well worth attention by the potato grower who wishes to secure the best returns for his labor. At one of these meetings, that at El Monte, there were two sessions announced, and at the first one of these not a single grower was present from the locality in which the meeting was held. There were attendants from Hollywood, Inglewood, Wilmar, San Gabriel, Manhattan Beach and other sections of Los Angeles County. In El Monte, with an acreage of over 2000 devoted to potatoes, not one grower attended this particular session. We have had occasion to chronicle scant attendance at these helpful meetings at other times, but never before have we known of a meeting at which no one was present from the community in which the meeting was held.

Owing to the small attendance at the El Monte meeting, the sessions took the nature of a round table conference. A large exhibit of potatoes with various diseases and pests was discussed and explained by Mr. Shear. Of course, potato tuber moth called for extended discussions. Best treatment is prevention, keeping potatoes where moth cannot reach them, use absolutely clean seed, keep the growing crop well hilled up, as soon as crop is dug destroy or feed all culls and keep the stored crop protected. If stalks are infested, burn all tops. About the only treatment for nematodes and similar pests is crop rotation. Starve them out of the soil by growing crops which will not afford feed. For rotation crops Mr. Shear remarked that it depended entirely upon the section and on the crops which were adapted, but as a suggestion he offered barley, corn, alfalfa, cabbage and similar crops. Beans were also given as a possible crop, but these are also subject to many of the pests which infest potatoes.

For prevention of scab the soil must also be clean and free from fungus. All seed should be treated, for it is practically impossible to get seed entirely free from this pest. Mr. Shear recommended a dip composed of four ounces corrosive sublimate (bichloride of mercury) dissolved in 30 gallons of water. The best method is to dissolve the corrosive sublimate in a pint of boiling water, then add to the larger quantity of water, which should be in a barrel. The 30 gallons in a barrel will be about the right quantity for a sack of potatoes, which may be immersed in the barrel and permitted to remain for an hour and a half. This same solution will answer for treating five or six sacks. It should then be emptied and new solution used. This treatment costs only about 30 cents per acre and the results are so pro-

nounced that no grower can afford to grow potatoes without using this method.

How to get good seed was one of the points discussed at these institutes. Mr. Shear referred to the new law which permits certification as to quality of seed and recommended every grower should make an effort to produce seed which could secure certification. Unfortunately, it will probably be many years before this certified seed will be very general, this because growers are finding many obstacles in producing a seed which will pass. There must be three inspections while the crop is growing. One of these inspections is at blossoming time, this to be sure that there is only one variety in the field; another important inspection is when the crop is nearly

mature. At that time 100 hills are dug to see if weight comes up to standard and also to determine as to whether five of these hills shall each weigh less than 30 per cent of the average. If it does, the field is disqualified. Then, of course, there must be no eel worms, tuber moth, powdery scab nor wart disease and the crop must be practically free from late blight, scab and rhizoctonia.

Why should this country import \$2,801,974 worth of tomato paste from Italy, as was done last year? It is made by crushing the tomatoes, straining out the skins and seeds and reducing the pulp to about one-fourth its original volume by evaporation in vacuum boilers, although for special purposes it is reduced to as little as one-twelfth. It is used in Italy in a great many dishes, perhaps the most familiar of which to Americans is spaghetti. The demand was created by Italians who moved to this country, but has spread among Americans. We grow tomatoes enough on this side of the water to prepare this paste.—Rural New Yorker.

CUCUMBER AND MELON BEETLES

Cucumber and melon vines are often infested for the second time in a season with the striped beetle. I have heard of some novel methods of getting rid of these pests. One farmer soaks corn cobs in coal oil and sticks them in soil about the hills of cucumbers or melons. He says the bugs go another way. Another grower tells me he soaks an old rag with carbolic acid and lays it on the hill among the vines. Still another says he always plants two or three onions in each melon or cucumber hill, and he declared he has no striped bugs at all.

One gardener has a large torch, and when he discovers these bugs about the patch of vines he lights the torch and holds it near the vines, not close enough to burn the leaves, but near enough to attract the bugs which fly into the flame and are burned to death.

I have found it just as easy and effective to dust the vines with dry Paris green while the vines are damp. It is applied with a puffer or bellows as the potato tops are treated with the same poison.—Successful Farming.

2925 Lbs. of Beauty, Silence, Power, Comfort and Strength

This is the unique way one owner of THE SIX of '16 describes the latest Mitchell masterpiece. This beautiful, long, luxurious car calls for a new method of description.

All predictions for its success have been surpassed, but by pushing the factory to its utmost limit—twenty-four hours a day, seven days a week—we are able to meet the demand, so that immediate deliveries are possible.

The reason for this success lies in the car itself. It is the greatest car value the world has ever known.

You are impressed with its beauty at first sight. But it is when you are rushing over the country roads, with never the feel of a bump, that you realize its full value.

Every car delivered creates enthusiasm that sells another car. Words cannot describe THE SIX of '16. You must see it—feel the wheel—get the thrill of its smooth action.

Why not come in at once and see THE SIX of '16. A car is here at your disposal for a trial spin. Get the personal touch.

days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**GREAT IS CORN**The corn crop this year will ag-
gregate the enormous total of 3,000-
000,000 bushels. Illinois stands at the
head with a production of 358,600,000
bushels. California is not even men-
tioned as among those present. Wis-
consin is the smallest producer of
corn named in the list sent out by the
department of agriculture, and it will
produce 40,900,000 bushels. Califor-
nia with its little 2,000,000 bushels
cannot qualify as a corn state.Here is opportunity for develop-
ment.**THE LAW**There is an organization which
is called the Camp Fire Girls, recently
started in order primarily to help the
working girl. There are three ranks
which a girl may obtain by being a
member of this organization; first,
wood gatherer; next, fire maker;
finally, torch bearer. Following is the
law of the organization: "Seek beau-
ty; give service; pursue knowledge;
be trustworthy; hold on to health; glo-
rify work and be happy."We take it that the first clause,
"Seek Beauty" refers not to beauty of
person like unto the marshmallow,
which some girls seek, but the beauty
of the mountains and hills and others
of the treasures of nature. Including
that and all the other laws we believe
they are adapted to all of us and might
well make a good working motto.**RURAL CREDIT**We call attention to the address
of Mr. Herrick made this week at the
Rural Credits Congress held at the
exposition. It contains a fund of in-
formation which is worth careful
reading. Many would have a form of
rural credit which would enable any-
one who desired to be a farmer tosimply indicate to "the government"
the need and the money would be
forthcoming. One's credit is not built
up in a moment. It must follow years
of saving, the foundation on which all
credit is built. We understand there
are times when a money lender will
take a "moral risk" but when this is
done it is usually because the moral
risk is almost equivalent to an estab-
lished reserve. This has been made
plain to us all in a most emphatic
way during the last few days. Eng-
land and France came to the money
markets and asked for credit to the
extent of a billion dollars. These two
great nations are supposed to have
a credit practically unlimited but we
have all seen that American capital-
ists were not quick to come forward
with the desired billion until these
two nations produced the best of se-
curities for collateral.increase his prosperity with the idea
that the prosperity of the merchant
comes primarily from the farmer. We
do not believe there was ever a time
in the history of agriculture when
merchant and manufacturer were
uniting so freely with the farmer in
organizing and financing movements
which look to bettering agricultural
conditions.**IRRIGATION CONGRESS**The longest and most important
session yet held by that important
body, the International Irrigation Con-
gress, closed on Tuesday in San Fran-
cisco. Meetings have been held in
Stockton, Fresno, Sacramento and San
Francisco. The last day, while given
up to a discussion of rural credits, was
only an extension of the irrigation con-
gress.

Amongst recommendations made

THE MERCHANT'S STORYOne of our greatest storekeepers was asked why he spent so much
money in advertising. People knew all about him; he had the best store
in the city and he did the largest business. This was his reply:"I advertise in the papers simply because it is the cheapest way in
which I can deliver the story of my goods and tell it to the greatest num-
ber of people who ought to be my customers. The space in my store is
limited; I want to carry all the goods I can and I want to get as many
customers in there as possible."If I tell the story of my merchandise in print the customers know all
about it when they come to the store; they ask for what they want, get it
very quickly and make room for others. We could not possibly handle
half our trade if the clerks had to stop and explain everything or intro-
duce the goods to the customers, so by a little money spent in advertising,
I fill my store more often, handle more merchandise and keep fewer clerks.
It is the most satisfactory way in which to do business because it is
cheapest."Many national advertisers believe that the country storekeeper has not
time to fully learn all the facts regarding some articles so as to fully
explain their merits, and so these national advertisers spend large sums
of money in order to tell the correct and complete story direct to the
buyer, and thus they send customers into the local store fully posted as
to what they want. This saves the storekeeper a lot of time and expense,
because it saves a lot of unnecessary conversation.Advertising is the greatest salesman the world has ever known and it
is by all odds the most dependable. We want our readers to realize this
—we want them to understand that the only possible hope for advertising
to be successful is to keep it truthful. We believe this to such an extent
that we guarantee all our advertisers will treat you fairly, as you may see
by reading the notice at head of this page.The American farmer must expect
to secure his credit in the same labor-
ious way. However, if our crops are
to be produced and harvested and
marketed there must be some arrange-
ment by which a fairer system of
credit may be extended than has pre-
vailed in the past, and this is a task
worth the effort of both state and na-
tion.**EFFICIENT BOOSTING**California has done some strong
boosting for itself. In fact, our abil-
ity to put our best foot forward before
all the world has been remarked up-
on since the days of '49. Some delin-
quents have at times appealed to this
spirit with "Don't knock, be a boost-
er!" Now we believe there are times
when a good, vigorous kick is required
and it can be given by the average
Californian when necessary.But as to boosting, there is a justi-
fiable and constructive kind and this
is the variety being engaged in by the
Riverside County chamber of com-
merce. This is a new organization
which is beginning at home with its
work. It is composed of local cham-
bers of commerce the county over,
with in addition many producers who
are not members of the regular com-
merce bodies. The first work to be
taken up by this organization is to
encourage the farmer to organize andwere: State engineers should inspect
every proposed irrigation district prior
to its organization, this in order to
protect investors; the United States
Reclamation Service should be put on
a financial basis in order that the ex-
pense of its administrative work in
Washington may be met out of a gen-
eral fund and not charged to pioneer
settlers; that a committee be ap-
pointed to investigate the feasibility of
erecting a permanent home for the
International Irrigation Congress. It
was urged that the congress of the
United States be asked to pass a bill to
establish a national marketing com-
mission. Rural credits were fully and
completely endorsed. There is general
disappointment at the failure to en-
dorse the Newlands-Broussard re-
clamation bill. The principles of the
Newlands bill were fully endorsed but
there was a feeling that the details
had not yet been sufficiently worked
out to endorse the bill as presented.Officers for the coming year are
Richard L. Burgess of El Paso, presi-
dent; J. S. Dennis of Calgary, Can.,
first vice-president; George Albert
Smith of Salt Lake, second vice-presi-
dent; L. A. Nares of Fresno, third vice-
president; Kurt Glumwald of Denver,
fourth vice-president; L. Clapp of
Hatch, N. M., fifth vice-president;
Arthur Hooker of Spokane, secretary.
The next place of meeting was left in
the hands of the board of governors.**Agricultural Notes**The Erie railroad leases to farmers
strips of right of way along its tracks.A large factory for the manufacture
of alcohol from sweet potatoes is lo-
cated in Lagoa, Azores Islands.A cooperative fruit marketing asso-
ciation has been formed by fruit grow-
ers and shippers of Havana. It is
to be known as the Cuban Fruit Ex-
change.To relieve sections of the country af-
fected by drouth the Brazilian govern-
ment has appropriated a sum of money
equivalent to a million and a quarter
dollars.A cannery factory at Sodus, New
York, has been experimenting with
cherry pits this season. The pits are
first dried and then crushed in prepa-
ration for a process which extracts
the flavor of the kernels. The ex-
tract obtained is used to give flavor
to the canned fruit, the report says.A sub-tropical plant experiment sta-
tion has been established near Miami,
Florida, by the United States depart-
ment of agriculture. Work has been
done along this line on a small leased
tract of six acres for some 17 years;
the new tract is much larger and has
been purchased for permanent experi-
ment grounds.The peach crop of the country will
amount this year, it is estimated, to
more than fifty-eight million bushels.
Georgia ships practically double the
amount of any other state, 4,803 car-
loads coming from there in 1914. Cal-
ifornia, Washington, Ohio, Michigan
and Colorado follow with shipments
of between two and three thousand
cars.The citrus fruit industry of Pales-
tine, which prior to the war was rap-
idly becoming of great commercial im-
portance to that historic country, is
experiencing serious reverses. Added
to these troubles, a scourge of locusts
has now devastated the citrus groves
of Syria, taking, it is reported, about
two-thirds of this season's orange,
mandarin and citron crop. The lo-
custs have eaten all the leaves and
peeled the small branches of the cit-
rus trees.The blow in the face received by
American industries through condi-
tions brought about by the European
war has acted as a tonic, has forced
the nation to create new branches and
enlarge the scope of existing phases
of manufacture, opened the way to
utilize, on a vast scale, great natural
resources of the United States, and
induced manufacturers and merchants
to expand their markets into foreign
fields with prospects of permanent re-
sults, says the bureau of foreign and
domestic commerce of the department
of commerce in a forecast of the ef-
fect of the war on the industrial fu-
ture of the country.From Port Limon, Costa Rica, comes
an account of attempts to utilize
bananas rejected for shipment. Here-
tofore great quantities of the fruit
have been thrown overboard by inspec-
tors, one bunch because it is a little
bruised, another because it has grown
too loosely, another because it has less
than eight "hands." Stock will eat
green bananas, but the amount thrown
in the bay at Port Limon alone, for ex-
ample, is enough to feed five times
the head of stock in the place and all
the people as well. Several plants
have been established to manufacture
banana flour, chips and "figs." The
latter are simply ripe bananas dried by
artificial heat.

Agricultural News Notes

of the Pacific Coast

Northern California

The Santa Rosa Republican reports the recent sale of 1914 hops at 14 cents a pound.

The St. Helena Vintage Festival and Napa County Fair called out an attendance of over 6000.

The Yolo County farm bureau fair, held early in September at Woodland, was a complete success.

A hop kiln containing 24,000 pounds of hops was destroyed at Hopland, Mendocino County, last week.

Sonoma County's first bean thresher is being tested out on the 180-acre ranch of Mr. Gillou near Windsor.

Sonoma County poultrymen are planning to make a hard fight to maintain the constitutionality of the Chinese egg bill.

The Diamond Match Company of Chico last week sent a large shipment of beehives and bee supplies to Valparaiso, Chile.

The Business Mens' Association of Chico, Butte County, is starting a movement for the appointment of a farm adviser.

Humboldt County held its 20th annual agricultural fair at Ferndale, beginning September 7 and continuing for the rest of the week.

The Pomona Grange of Sonoma County has decided to make an exhibit of products in Oakland at the time of the national grange meeting.

The Sutter County branch of the State Farmers Protective League was organized at a recent meeting of farmers and fruit growers held at Bogue Hall.

Dates for Placer County farm bureau meetings are announced for September 24 at Sheridan, September 25, Mt. Vernon, 27, Roseville, and at New Castle.

Orange growers of Butte County are appealing for relief from the "eight-to-one" ruling. They hope to have a change made by which seven parts of solids to one of acid in oranges will be granted.

Farm Adviser Rubel of Alameda County has arranged a series of poultry meetings. The Livermore center is preparing for a combined land products and stock show to be held Saturday, October 9.

Farm Adviser Searls of Yolo County reports that the county farm bureau will ship this year several hundred tons of alfalfa hay to Napa and Humboldt Counties, and that a county in Washington is asking for quotations on alfalfa hay.

The state compensation commission has made a ruling that all accidents in which a laborer is injured on the farm must be reported to the state commission. The commission states that 6,500 farmers of the state have elected to come under the provisions of the act.

According to estimates of hop buyers California's hop crop this year will reach 120,000 bales. Sonoma is expected to produce 30,000 bales; Mendocino, 15,000; Sacramento, 57,000. The state of Oregon is expected to produce from 130,000 to 140,000 bales and Washington 45,000 bales.

Central California

The Modesto irrigation district will expend this year \$50,000 for improvements.

A field of rice planted at Modesto in Stanislaus County is reported in exceptionally fine condition.

The work of organizing the peach growers into a large cooperative organization is progressing satisfactorily.

Tuesday was observed as Rural Credits Day at the P. P. I. E., James Madison of Fresno making one of the principal addresses.

A total of 156 cars of grapes, chiefly Malagas, have been sold this season from the Fresno district to the Pioneer Fruit Company.

Millers and grain growers of Central California met recently at Stockton and discussed the matter of shipping grain in bulk instead of in sacks.

The Fresno District Fair will run largely to vaudeville attractions. One of the principal features will be a historical drama of the San Joaquin Valley.

A number of peach growers of Tulare County met recently at Visalia to discuss plans for the establishment of a cooperative cannery in Visalia or Farmersville.

A Lodi grape grower proposes to dry his low grade grapes and use as stock feed. He thinks a pound of these dried grapes contains more feed value than a pound of barley.

The Stanislaus County farm bureau will hold meetings at Patterson Friday, the 24th, at Salida, Monday, the 27th, at Hickman, Wednesday, September 29.

One close observer maintains that the farms of Madero County have been increased in value to the extent of \$1000 each since the establishment of the farm bureau and farm adviser in that county.

The cannery of the Tulare County Growers' Association has closed its season's run. It has handled over 35,000 cases of peaches. To put up this amount required the handling of 1100 tons of green fruit.

The following institutes are announced for Monterey County by the state university: September 28, Greenfield; September 29, Loneoak; September 30, San Lucas; October 1, Lockwood; October 2, San Ardo.

The California Associated Raisin Company has definitely announced that it will buy wine grapes and make them into wine. This action was taken to prevent growers from making wine grapes into an inferior quality of raisins.

A trial is being made of the state fruit standardization law in Tulare County. One Dinuba County packer has been declared guilty of packing mildewed grapes. He has given notice that he will appeal to the higher courts if necessary.

The Corralitos, (Santa Cruz County) Fruit Growers' Association recently sold 50 cars of Newtowns to one San Francisco concern. Another sale of 90 cars was made and the total sales for the one association in a period of three days aggregated 140 cars.

Southern California

The cannery at Yucaipa, San Bernardino County, will start on tomatoes today.

An orange marmalade factory has been established at Anaheim in Orange County.

Walnut growers are anticipating this as one of the most successful seasons of the industry.

Pomona estimates she will produce about 250 tons of walnuts. The harvest is now under way.

The East Highlands (San Bernardino County) Citrus Association is constructing a \$10,000 packing house.

The Antelope Valley in Los Angeles County is receiving large numbers of dairy cows from the San Joaquin Valley.

Walnut picking is well started in Orange County. Very little damage was done to the nuts by the recent hot weather.

Apricot growers are feeling more hopeful as to the dried apricot situation, some sales having been made around seven cents.

Horticultural Commissioner Waite of Imperial County reports a considerable amount of damage done by grasshoppers this year.

Anaheim producers have decided to install a prize-winning exhibit at the Orange County fair to be held at Santa Ana, October 12-16.

A fine market grade of rice has been grown eight miles below the border in Mexico on the ranch of the Pacific Land and Cattle Company.

San Bernardino County veterinarians have been making tests of various dairy herds and find remarkable freedom from bovine tuberculosis.

Horticultural Commissioner Wood of Los Angeles County has given warning to the pear growers of Lancaster that they must be prepared to fight pear blight.

The chamber of commerce is working with peach growers in the neighborhood of Chino in San Bernardino County in the effort to organize a cooperative cannery.

A committee of boosters in charge of the National Orange Show to be held in San Bernardino early in 1916 promise the most liberal offerings of premiums yet made.

Peach growers of Yucaipa, San Bernardino County, have united to stop thieving in their orchards. They report that peaches have been carried away by the wagonload without the formality of consulting owners.

Oak Glen, the Yucaipa Valley, and other sections near Redlands, are planning for the greatest apple show yet held in Southern California. It will be held some time during November. Beaumont, Banning and other Riverside County sections will join.

Experts from cotton mills in China have been in the Imperial section making investigations as to length of staple and other qualities of the cotton crop. It is reported that the experts were satisfied with the quality and many shipments of cotton to China will be made.

The Coast

Seattle is shipping liberally of Spitzenberg and Jonathan apples to Alaska.

The crop of prunes at Monmouth, Oregon, is reported to be the lightest in many years.

Dairymen of Walla Walla, Washington, have decided to organize a cow testing association.

There are approximately 11,000 people gathering hops in the vicinity of Rickreall, Oregon.

A bunch of 100 convicts from the penitentiary at Salem, Oregon, have been working in the flax fields of Gaston.

The most disastrous grain fire of the season in Umatilla County, Oregon, destroyed more than 2000 sacks of wheat near Helix.

The Mutual Creamery Company of Pocatello, Idaho, has decided to distribute to dairymen in Idaho and Utah dairy centers 20,000 pure bred cattle.

The exhibit of Holsteins at the Interstate Agricultural Fair, held at Spokane, is said to have been the largest of pure bred stock brought together in the Northwest.

Live stock men of Eastern Washington report that on account of low prices on wheat and barley live stock is meeting with good demand, with indication of advance.

The indications are that the Cascade International Stock Show which will be held at Pullman, Washington, November 22-27, will bring out at least 40 carloads of pure bred stock.

Owing to the shortage of mutton farmers of the Northwest have been appealed to to grow more sheep. The shortage the country over is estimated to be in excess of half a million sheep.

The Spokane Fruit Growers' Company has adopted a minimum wage scale to be paid to apple workers during the coming season. The membership of this company has increased largely this summer.

Hop growers of Oregon are disappointed over the small crop that is being harvested this year. The yield has been much under the amount estimated. It is now thought that the crop will not be more than 100,000 bales.

The Oregon agricultural college at Corvallis reports a cow in one of the cow testing associations which gave a total of 8025 pounds of milk, containing 419 pounds of butter fat. Records were kept as to cost of feed which was \$39. The net profit on this cow was \$87.

Walnut growers of Oregon and Washington have formed an association to be known as the Western Walnut Association. H. V. Meade of Orasco has been elected secretary. The first annual convention of the new association will be held at Portland, November 3.

Twelve farmers were arrested at the farmers' market in Salt Lake City, Utah, the early part of this month by federal and state officials. They were charged with violating the new net container law which provides that quantity of contents must be plainly marked on outside of package.

Live Stock and Dairy

SCRUBS AND PURE-BREDS

Written for the California Cultivator
By Sacramento Valley Contributor

FARMER moved to one of the newly developed sections of the Sacramento Valley from a Middle Western state.

He had been a renter there and had saved up enough money to buy a farm on the installment plan, plant a small orchard and some alfalfa.

Being a hard worker and knowing the farming business, doing some work for his neighbors and for non-residents who had planted trees, he is getting along and paying for a farm that will return to him a better living than he could have secured on a rented farm in the East. And this farm is his own. He works hard, but he has always done that, and when his orchard comes into bearing he hopes to be able to take things easier, at least for a part of the time.

Coming from the corn belt he knows hogs, and one of the first things he did after he got started here was to buy some sows and a boar from a neighbor. They were common California hogs, just common, ordinary hogs.

Our Eastern friend took care of them much the same as he would have in the East, and because of the more favorable conditions here expected them to do as well or better than his hogs had there.

He was doomed to disappointment, however. They did not grow as they should, and as they aged they seemed to get longer in the snout and lighter in the ham. They were hard to keep within fences and were able to rustle, but showed no indication toward early maturity. To keep a hog more than a year did not meet with this raiser's notions of the hog business, so he decided there must be something wrong with California as a place to produce hogs.

This led to an investigation of what others were doing with hogs, and he found that where high grade or registered hogs were being kept and where they were given anything like the care and attention that hogs require in the East very satisfactory results were being obtained.

He found registered hogs making gains of a pound a day when they weigh about 100 pounds and occasionally one making a pound a day from birth to six months old, 180 pounds at 180 days, some even doing better than that.

He found that where farmers were using registered boars they were getting pigs that were not only of better type, but that were ready for market long before the common scrubs.

Now he has sold all of his mongrel hogs and has bought a few high grade sows and a registered boar. His hogs are working for him instead of the converse.

PROPOSED MARGARIN LEGISLATION

The National Dairy Union, an organization of dairymen of the United States, is sending out the draft of a proposed bill to be introduced at the next session of congress. The objects of the bill are to change the name of

oleomargarine to margarin, to change the rate of taxes, to make all substitutes of dairy products subject to laws of states and territories into which they may be transported, and to make other amendments to the original oleomargarine bill.

Section 11 of this act provides for a more efficient means of detection of fraud by giving greater power to the bureau of internal revenue. Amongst its provisions are:

"No margarin shall be manufactured in imitation or semblance of butter of any shade of yellow—for the purpose of this act margarin shall be deemed to be in such imitation or semblance of butter of any shade of yellow, if the diffuse reflecting power for light of wave length 436 micro millimeters is less than 70 per cent of the diffuse reflecting power for light of wave length 578 micro millimeters the temperature of sample being 70 to 80 degrees Fahrenheit; no margarin shall be manufactured by mixing butter with the same or which contains more than 5 per cent of milk fat. If any person who sells, vends or furnishes margarin for the use and consumption of others, except to his own family table without compensation of others, except to his own family table in any coloration that causes it to look like butter of any shade of yellow such act shall be deemed a violation of this law. Any person violating any provision of this section shall pay for the first violation thereof not less than \$100, nor more than \$1000, and for each subsequent violation not less than \$500 nor more than \$5000 or be punished by imprisonment of not less than six months nor more than two years, or by both fines and imprisonment."

The dairymen of the United States cannot object to the manufacture of margarin nor to its sale as such, but they do object, and most properly, to its masquerading under the name of a dairy product which costs many times as much to produce. Their attitude is the same as that of the olive grower who pays a dollar or two dollars per gallon as the cost of manufacturing olive oil. He naturally rebels when the cottonseed oil producer, who has put into the cost of the manufacture of a barrel of cottonseed oil less than the olive producer has put into the manufacture of his gallon, endeavors to sell it under the name of olive oil. Cottonseed oil is a fine food product and we doubt not its use will greatly increase, but none of us wish to buy it on the olive oil basis.

BUY REGISTERED BOARS NOW

Written for the California Cultivator
W. S. Guilford

I would say to every producer of hogs in California who is not using a registered boar at the head of his herd that now is the time to buy one, for if there are no sows to be bred just at this time it will not be long before there will be, and by buying now and having a pure bred sire ready to use when needed there will be no question of using a grade or scrub animal just because he is handy and because you do not know just where to "pick up" a pure bred on short notice.

It is a big advantage to have a male

breeding animal on the farm for some days or weeks before he is to be used so that he may become accustomed or wonted to his quarters, feed and new conditions. It is well to feed him a ration nearly like the one he has been used to—if that ration has been a properly balanced one. If not, the principal feed or feeds could be continued in use and such additions made as may be thought necessary. For instance, if he has been getting an exclusive barley diet, this should be supplemented with alfalfa, tankage, oil meal or middlings, and if the feed has been exclusively alfalfa, some barley can be fed if he is to be used heavily soon.

The best age at which to buy a registered boar depends on the use to be made of him, the price desired to pay and the conveniences for handling the animal.

Many choose to buy a pig soon after weaning time and grow him to maturity themselves. The cost price is less, the cost of shipping by express is lower, he can be fed and developed as desired by the new owner, and when he is needed he is perfectly at home, is not shy and nervous as boars sometimes are when first brought to a new place.

Others prefer to buy a boar that is ready to use, say at eight months to a year old, or a little older, a young animal with a life of usefulness before him. He costs more, but there has been no bother in growing him and he comes to his new owner a finished product.

Another class of boar buyers favor securing an older animal that has been a proven breeder in some good herd. There is very little experiment in using such a sire, for his pigs are the test of his usefulness. Old, tried boars, in good condition at three to five years old, should be in their very prime if they have been properly handled. A Berkshire boar older than this will be used as one of the five or six herd boars at the Butte City Ranch at Butte City, Glenn County, this season, and litters sired by him during the past year indicate that he may get something sensational.

There is no breeder of hogs in California who can afford to use anything but a registered boar. If a boar sires pigs, and they weigh only ten pounds more at six months old than they would have if sired by a scrub boar, this 1000 pounds of pork is worth six cents per pound and there is a profit of \$60 on one crop of pigs, to say nothing of the added value to those to be kept as breeders.

OUR COVER

The illustrations used on our cover page this week are of a couple of heifers which may sometime be making themselves known in the dairy world. They carry the blood of some great producers and there have been many stranger things than that either of these fine animals should some time prove themselves to be world beaters.

The photos are of two animals which will be offered at the McAlister-Morris sales in October.

The heifer looking right at you is Wiegertje Girl Pontiac, daughter of King Pontiac Topsy, one of the best sons of King of the Pontiacs. Picture taken at 11 months, weight at 12 months, 10 days, 880 pounds.

Other heifer, Abbie Segis Pontiac, also daughter of King Pontiac Topsy. Photo at 11 months, weight at 12 months, 10 days, 906 pounds.

See announcement on other page.

SCREW WORMS

Screw worms have caused an enormous loss to stockmen in the Southwest. All farm animals are affected by them and stockmen must ever be on the alert to reduce the loss to a minimum, says Dr. R. H. Williams, animal husbandman of the University of Arizona agricultural experiment station.

It is especially difficult to give animals on the open range the attention they should have. On this account stockmen have made a practice of treating everything they see whether it belongs to them or not. They further make a special effort to have an enclosed pasture where animals may be held conveniently and treated from time to time.

Stockmen should make a special effort to prevent the animals from becoming bruised or injured and when such an animal is found, a special repellent should be applied to keep away the adult flies. There are no good fly repellents that will keep away flies for more than a week. Common coal tar has been used to good advantage, but it soon dies and also has an objectionable feature of blistering the skin. A mixture of fish oil and tar made up in equal parts has good repelling qualities. Crysillie ointment two parts and chloroform one part, mixed thoroughly and applied as a paste, has also been used to advantage. Another good preparation is turpentine one part, pine tar three parts, and fish oil two parts, mix thoroughly and apply as a paste. It is claimed by some people that sprinkling the surface of a wound with cayenne pepper will keep flies away for about a week.

Where animals are found that are actually infested with screw worms, the first thing to do is to remove all maggots from the wound. A good preparation for this purpose is a 10 per cent solution of sheep dip, which should be sprinkled over the affected parts. This preparation will cause the screw worms to squirm out of the flesh and they may be brushed on to the ground. It is also wise to have a small pair of pliers that should be used to search through the diseased portion and remove the maggots. After all the maggots are removed, a good repellent should be used to keep the flies from depositing eggs. Any of the above preparations should prove efficient, but a mixture of three ounces of coal tar to one ounce of carbon disulphide will prove especially beneficial. This formula should be mixed thoroughly and kept well corked as it is both volatile and inflammable.

CAUSES OF ABORTION

Abortion may be accidental, caused by the cow's falling or getting injured by another cow. It may also be caused by feeding an unbalanced ration, or by feeding a ration which is exceptionally rich in protein, such as alfalfa hay. Alfalfa hay is very hard on the kidneys of animals, and as about 80 per cent of the waste matter from the body is passed through the kidneys, when too much of this element has been fed, the kidneys are unable to do all of their work. So when the cow is pregnant, the kidneys have increased work to carry off the waste material from the foetus, and, being unable to do this, the calf is poisoned by its own waste products and of course the cow aborts. Concerning contagious abortion, I wish to say that when a cow has aborted, she should be isolated from the other cows, and the place where she has stood should

West Coast Seed House

116-118 E. 7th St., Los Angeles

be thoroughly disinfected by using a five per cent solution of carbolic acid or one part of corrosive sublimate to 100 parts of water. The aborted calf or membrane should be destroyed by burying deeply or burning. The vagina and uterus should be washed out every day for a few days with a solution of corrosive sublimate—one part to 1000 parts of water is advisable—and the following precautions should be taken: Cleanliness; the free use of antiseptics; isolation of infected cows; precaution against breeding to infected bulls; and no cow that has aborted should breed until after three to six months. Sooner or later the disease seems to wear itself out and disappear from the herd, and some authorities claim that the animals become immune to abortion; but I wish to say that the financial loss to farmers is very great and also many cows after aborting are sterile. I should also like to recommend the following, not claiming it a sure cure for abortion; however it is a mixture which has given exceedingly good results in the Salt River Valley and other places:

Ten pounds sulphur, six pounds copperas, three pounds saltpetre, three pounds air slacked lime, one pound asafetida.

One pound of the above mixture is mixed with 10 pounds of salt and place where the animals can eat what they desire.—G. W. Barnes, Livestock Specialist in University of Arizona.

Alfalfa Pasture for Calves

Is it bad practice to allow suckling calves to run on alfalfa pasture.—Subscriber, Daggett.

That depends on what you intend to do with the calves. If they are to grow up to be steers or cows then it is all right to let them run on pasture but if you are raising them for veal they will get fat quicker if kept tied up and only allowed to suck the cows twice a day.

Barley Beards

One of my mules has a sore neck caused by barley beards. It has been that way for two months. It broke and discharged considerable matter. What shall I do to cure it.—Subscriber, Daggett.

The opening should be made large enough so you can examine it and see that no barley beards or any thing else remains in the cavity. Then wash it out once a day with plenty of warm water to make the parts clean, and finish by wetting the inside of the cavity with a one per cent solution of permanganate of potash which you can get from your druggist.

Growth in Eye

I have a milch cow that has a peculiar lump in her left eye. Seems to be fast on the washer of the eyeball, about half way between the corners and on the lower side of the ball. Is about the size of a pea and is of a fleshy nature. She can draw it down behind the lower lid. The eye waters some. What can be done for it?—Subscriber, Kerman.

The growth may only be of the nature of a wart. Being on the eye of course it is very annoying. Get a small quantity of nitric acid from your druggist. Tie the cow's head up so she can not move around much. Press the eyelids away from the wart and rub some vaseline all round the wart. Then with a small swab dipped in the nitric acid just touch the wart a few times with the acid. You will need some help to do it carefully. Be sure that the acid does not touch any other parts and do not get it on your hands or clothes. It is very caustic. One treatment will probably be sufficient.

Cow in Heat While with Calf

My Holstein cow was served the 13th of December last and should be fresh this week. She was in heat about three weeks ago and again today. There are no signs of calving, although she has been developing udder and it has gained double in size in the last ten days. Is running in wild pasture where there is salt grass, Bermuda and other wild grasses. Is with five heifers not her calves. This will be her third calf and she never acted like this before. Is it common and what can be done for her?—Subscriber, Visalia.

Probably by this time the cow has her calf all right. The signs of her being in heat was a false alarm. It was probably one of the heifers that was in heat and the cow running after her made you think it was she and not the other. The fact that she was "making bag" is a good evidence that she was with calf and about to be fresh. If our diagnosis is not right please let us hear from you again.

Scar From Wire Cut

Have a five-year-old horse that was cut on a wire in the hock about a year ago. The cut healed as well as I expected but left a thick scar or crust where the cut was. He would be more valuable without that blemish and I would like to know if there is a remedy that will bring hair on that part.—Subscriber, Santa Maria.

You probably cannot get rid of all the scar. You may be able to reduce it some by applying the following ointment which your druggist can prepare for you: Tincture of iodine, two ounces; iodine crystals, one dram, and lard, four ounces. Mix and apply as directed. Scrape the surface to remove all the scabs and crust that you can and apply the ointment once a day.

Bloody Milk

Heifer fresh about two months with her first calf, has been giving over five gallons of milk from the first and is still giving it. Right hind quarter giving bloody milk for about two weeks and is getting worse. Some soreness. Good condition. Has all the alfalfa, green and dry, that she can

eat. Had another heavy milker that gave a little bloody milk for a while but recovered all right.—Subscriber, Waukena.

On account of her giving such a large flow of milk she is probably a heavy feeder and the strain on a young animal is too great. Reduce the feed. Give her a physic of one pound of Epsom salts and half a pound of common salt dissolved in two quarts of hot water. When cool give at one dose as a drench. Also give one ounce of chlorate of potash in the feed or drinking water once a day. Bathe the udder with water as hot as you can bare your hand in and milk her every eight hours until all soreness and blood have disappeared.

Rupture

I have a fine mare that became ruptured about a month before she had her colt. It swelled about as large as a water basin. I have blistered it twice and it did no good. Is there any cure for it? Will it hurt to work her?—Subscriber, Dehesa.

Rupture in large animals is practically incurable. Blister will do it no good. An operation would be the only remedy and the chances are that that would fail. Better get along with her the best you can as she is. Ordinary work will not hurt her.

Mange

I have a male, toy, black and tan terrier that has had the mange for several months. Have tried several different remedies but he still has sores and the hair does not come in but he does not scratch himself as much as before. I feed him bread and milk chiefly, but no meat. Will you please tell me what to do for him through the Cultivator.—Subscriber, Palmdale.

Am inclined to think the trouble is due to one kind of feed being continued too long. Give him one grain of calomel and repeat it in one week. Give him some raw beef. Get a bone with a little meat on it and let him earn it by gnawing it off the bone. If this does not relieve the trouble shortly then get a veterinarian to inject a canine vaccine that is now used for such cases.

You Must Not Fail!

Poultry for Profit

SELECTING THE LAYERS

Written for the California Cultivator
By Jean A. Koethen

GOOD deal is being said these days about the selection of the pullets that will be profitable layers and of the hens that have made good. A few years ago a hen was a hen. If she had shining plumage and a bright comb she had a right to live and to pose, if she chose, as the best of the bunch. War prices, alas, are putting an end to the pretensions of the farmyard belle, and we are asking sternly, "What has she done?"

The poultryman who uses a trapnest selects his layers without further trouble, but he will save himself some expense if he culls his pullets before they go into the laying houses. The many sideline and back-lot poultry keepers who do not find it convenient to use a trapnest must cull even more carefully in the beginning and must depend upon physical characteristics as indications of fecundity or the lack of it.

Culling the Pullets

In looking over my own pullets this summer I decided that every one that has not a fairly good comb at six months must go. My February pullets all had red combs at six months and were laying before seven months, but a few of the March pullets are slow in developing comb, and these I am marking for table poultry. This may seem drastic, but experience has satisfied me that an Orpington that is behind the average in developing comb will never come up to what is expected of her. The development of the comb goes hand in hand with the development of the organs of egg production, and the pullet that is slow in beginning to lay is rarely a high producer. There are exceptions, I know, but only enough of them to prove the rule.

If from six to seven months is the time for laying maturity with heavy breeds, as I believe it should be with fowls that are bred for eggs and not for show, what shall we say of Leghorns? I think we shall not go far wrong if we assume that a White Leghorn that is not laying at six months is probably not worth keeping, but I have had too little experience with them to be absolutely certain on this point. Many Leghorns do lay far earlier than this, and six months seems a reasonable age for any properly raised pullet to begin her life work. One of the best layers I ever had was a Rhode Island Red that laid her first egg the day she was six months old, and laid three days out of four as long as I was able to watch her.

Then there is the matter of size and shape. The best layers in a flock are not usually the largest hens, neither are they the undersized birds. Beware of the thin, "peaked" looking pullet. Beware too, of the short-backed bird. I believe a short back is considered no objection in a Wyandotte, but in most, if not all other breeds, the laying type is the long-backed type. I have my eye now on a pullet with a short back and almost a squirrel tail, and she is such a conspicuous contrast to her long-backed, deep-chested Orpington sisters that she must go to

market along with the pale-combed birds. A short back and a high tail do not go with the large abdomen and deep chest of the high producer.

The hen to which we look for eggs, no matter what her breed, is of a noticeable wedge shape, with the small end of the wedge in front; that is, she must be deep in the keel, but wide at the rear where the egg-organs are situated. She should also have a large, soft abdomen. The hen with a hard, firm abdomen is a table bird, not a layer.

It has been quite well established that the hen with a comb that is large for her breed is, other things being equal, the best layer, and I am glad to see in some of my March and April pullets conspicuously large combs. One of them has a head-piece so very large and ruffy I feel sure she will lay at least 200 eggs. Two years ago when I was sending most of my yearling hens to the butcher I selected almost entirely by size of comb, keeping only those with noticeably large combs. A remarkable increase in egg production in the next generation showed the wisdom of my selection. While it would not be safe to follow this rule absolutely, where no attention has been paid to size of comb in breeding, it is safe to say that the pullets which are late in developing comb should be thrown out and that those with large combs should be kept and watched.

Culling Yearling Hens

The yearling hens will be our breeders next spring, and it is of extreme importance that they be our very best.

I like the idea of selecting the breeder according to her time of molting. A hen can be forced to molt early if she is first deprived of food and then well fed on feather making food, but if this is done we lose one of the most valuable guides to her value. Beware of the hen that comes out in full fall costume in September. She may lay a few more eggs than the late molter, but they will probably be cheaper eggs. When I see a hen still ragged and faded in October, I know she is the hen for me. If, at Thanksgiving, she is still in her old clothes, her price goes up a big notch. The pullet that begins early in her first season is pretty sure to be the yearling hen that refuses to molt till the price of eggs begins to drop. I always feel a thrill of enthusiasm when I see a hen like that. She is worth a dozen of the late-beginning, early-quitting sort, and an inspiration to us lazy humans.

The latest scheme for selecting the breeder is that of selecting according to the color of her legs. One of the experiment stations began it; another took it up, and now it has been so generally exploited that it may be considered official. The idea, in simple words, is just this: that a good layer, if she has yellow legs lays the color out of them in a year, so that you may go through your flock the last of October and grade your layers by the shade of yellow in their legs. The color of the beak in the American breeds and of the ear lobes in White Leghorns is similarly affected. This

has been worked out in a number of large flocks, and found to be true in every case.

Now, this matter of color value looks very important at first sight, but it is really, as is apparent after a moment's reflection, just another way of saying that the late molter is the better layer. This selection according to color of legs and beaks and ear lobes can be done satisfactorily, it is averred, only in late October or November. At this time the early molters, which have had their rest, are beginning to show their original bright yellow color again, while the late molters, which are also the late layers, are still faded. In the case of fowls which have not yellow legs, I presume the same test would apply to the feathers, which are bright and glossy in the early molter and faded and dull in the hen that has been too busy to dress up.

Another principle of selection which has recently been formulated at the Missouri station is that of selecting according to rhythm or regularity of laying. Most hens lay with some sort of rhythm, three days and a skip, four days and a skip, or perhaps two and a skip. It does not require a great deal of intelligence to figure out that a hen that lays three days out of four is a better layer than one that lays two days out of three or every other day, and anyhow we need the trapnest for this sort of selection, and once we have the trapnest record nothing else matters. It is interesting to know that there is such a thing as rhythm in egg production. I always felt that there was some poetry in poultry culture.

In selecting next spring's breeders let us never for a minute, whatever fads we follow, lose sight of vigor as the foundation on which flock improvement rests. The late molter is almost certain to be a vigorous hen. So is the early layer. So is the hen that lays three days out of four, and the hen with a good appetite. I would as soon select a breeder by her appetite as any other way, if only she did not get too fat before breeding time came. Deep chests and good digestion, large abdomens and late molting go together, and we sum them all up in the one word vigor.—Jean A. Koethen.

An idea generally prevails that when a hen begins she has a certain number of eggs to lay after which she becomes broody. This idea has been proven incorrect, as the production of eggs is like an endless chain, which continues according to the ability given the hen by nature, unless interrupted or broken by broodiness or some outside influence, such as change in weather, location, etc. Broodiness is a condition of the brain and not of the body, for at the time the hen becomes broody she is in a laying condition, having the different parts of the egg partially developed, but because of remaining on the nest, lack of exercise, loss of appetite and lack of nourishment the hen takes the egg material back into her own system and uses it as nourishment, just as hens do when a sudden change in weather stops them from laying.—Denver Field and Farm.

Observe the hens closely at feeding time and immediately remove any hen that shows signs of cold in the head, diarrhea, droppings bright emerald green, emaciation, very dark comb, or a desire to keep apart from the rest of the flock.

Wanted to hear from owner of Farm or Fruit Ranch for sale. O. O. Mattson, Minneapolis, Minn.

Wanted—To hear direct from owner of good farm or unimproved land for sale. C. C. Buckingham, Houston, Texas.

FARM LANDS FOR SALE

The owner of 3000 acres near Madera desires to subdivide for real settlers; the land is typical San Joaquin valley loam, free from alkali, and will grow anything; railroad crosses property and there is abundant water at shallow depth; the land is for sale at the right figure to people with proper qualifications; no cash payment down and terms to suit, provided the purchaser has sufficient money to put the land under water. Remember that there are no real estate commissions to pay to swell the price of the land; all the owner wishes is interest on his money. No real estate agents need apply. GREENE ESTATE COMPANY, 207-208 Berkeley Bank Building, Berkeley, Cal.

For Sale—Yucaipa valley, 9 miles east of Redlands, paved road, midst 3000 acres apple orchards; 7 19/100 acres fine apples, four years old in Spring; 3 room house with bath, garage, cement flume, cheap water, all kinds of berries and family fruits, only ¼ mile to school. Double your money in short time; cheap at \$5000.00. For further information address owner, A. E. Keller, R. F. D. 1, Box 33, Yucaipa, Cal.

Good Government Land relinquishment of 160 acres for the price of the improvements and work done; house, barn, fencing, fine climate, wood and water, \$650 cash. W. Wallace Baldy, Raymond, Madera Co., Cal.

For Sale or Exchange for acreage on electric carline, a beautiful acre laid out for family living, 20 minutes from Los Angeles, 17c fare, fine neighborhood, gas and electricity, good schools, \$3500 value. Mrs. Richey, R. 8, Box 557, Los Angeles.

State Map Showing School Land in different counties of the State, plainly marked, \$2.50. County sectional maps, showing vacant U. S. Land, plainly marked \$2.50 each. Order TODAY. Booklet, FREE. Joseph Clark, Sacramento.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale or Exchange for Southern California acreage, 4 acres fine bulb or vegetable land in city of Santa Cruz. William Richard, owner, 438 River St., Santa Cruz, Cal.

SEEDS AND PLANTS

West Coast Seed House, Los Angeles, is offered for sale. A good growing business, central location, low rent, no debts. Will sell stock at less than cost, fixtures at a big discount, and nothing for the good will. Business established for years and has a good reputation. Also sell Poultry Supplies and manufacture Poultry Foods and proprietary articles that have a good sale. The name "West Coast" is well and favorably known. Stock inventoried July 1st at \$9332, but somewhat less now and can cut out some raw materials if not wanted. Would prefer selling as above for cash, but if you haven't all the money and can give good security, I will give time. Or will trade for good, well located land. I have other business that takes my time. T. S. Tompkins, 116 East 7th Street, Los Angeles, Cal.

Best, Cheapest Forage for poultry, cattle, hogs. Get our prices. Plant now. LUTHER BURBANK SPINELESS CACTUS PLANTATIONS, SAN DIMAS, CAL. Covina phone 902.

Burbank Spineless Cactus—Hardest varieties, "Melrose" and "Special." Strong, matured slabs, \$8.50 per 100; \$50 per 1,000. Labranza Ranch, Athlone, Merced Co., Cal.

Temary Beans for Sale—I have a limited amount I will sell for 6 cents. F. O. B. Redlands. Buy your seeds while they are cheap. Planting time this year they sold for 22 cents. A. B. Ward, Yucaipa, Cal.

Peruvian Alfalfa Seed—Halvy varieties, also Algerian wheat. S. P. Huss, Yuma, Arizona.

SCHOOLS AND COLLEGES

Wanted—About seventy-five young men and women to enter THE WESTERN NORMAL on August 30th, to prepare for teaching. Western Normal graduates secure and hold good positions. We assist graduates to secure good positions and promotion. We save you time and money. For information, address, WESTERN NORMAL, J. R. Humphreys, Principal, Stockton, Cal. 634 E. Main St.

Telegraphy—Stenography, bookkeeping, English branches. Positions guaranteed. Mackay Business College, Los Angeles.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Krukeberg Press, 237 Franklin St., Los Angeles.

Sacramento, California State Poultry Association, Jan. 14-18, 1916, C. A. Wilkins, P. O. Box 1117, Sacramento, secretary.

ANOTHER WORD ABOUT THE SALES

Mr. McAlister writes regarding the two Holstein sales:

"There has probably never been such a favorable opportunity for cattle buyers as there is presented this fall at the different auction sales of pure bred cattle. On account of the financial depression and the large number of cattle to be sold prices are lower than they have been for several years, and the breeders have been compelled to part with cattle that in ordinary times they would not have sold for almost any price. In the Sacramento sale there will be a greater aggregation of cattle than has ever before been offered at any sale ever held before in the United States. This will include many A. R. O. cows, large milk record cows, large yearly milk and butter record cows and sons and daughters of large yearly record cows, and many splendid individuals; yet at the present prices that Holsteins are bringing it looks as if they will bring less than has been paid in the past for ordinary pure breeds. This condition will not last long, however, for the good Holstein cow will undoubtedly bring over 100 per cent more next year than she is selling for at the present time. The man with the ready money therefore has the chance of doubling his money. We wish to state, however, that even if the stock to be sold at Sacramento don't bring 25 cents on the dollar that every head will positively be sold and there will absolutely be no bidding or anything kept back out of the 175 head."

Questions and Answers

THE EDITOR

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Alfalfa in Walnut Orchard

Is it advisable to grow alfalfa in ten-year-old seedling walnut orchard, then to pasture it off with hogs? The soil is very sandy. Have a water lift of 80 feet.—Subscriber, Moorpark.

There is no objection to growing alfalfa in a walnut orchard, provided always that there is sufficient water used to keep the ground moist. This, however, is where the danger lies as the alfalfa will use a larger amount of water than is generally supposed and the trees suffer in consequence of the alfalfa taking the water the trees should have.

There is no economy in pasturing alfalfa, particularly with hogs as they will crop the alfalfa so closely that much of it will not survive. This makes a thin stand of alfalfa, leaving much of the soil unshaded and allowing rapid evaporation of the water which should be avoided where water has to be lifted 80 feet. A better plan will be to keep the soil well cultivated with sufficient irrigation during the summer to keep it moist all the time. Then as soon as the walnuts are gathered irrigate the orchard, plow and sow about 12 to 14 pounds of melilotus seed per acre. If the weather should be dry during the winter irrigate often enough to secure good growth and plow under before the green crop begins to harden. If there should not be plenty of moisture in the ground at the time of plowing it is best to irrigate just before plowing so as to secure a rapid decomposition of the green crop. Before buying seed of any kind it is best to secure samples and test for germination by taking 100 seeds, placing them on a plate and covering with several thicknesses of muslin, keeping damp four or five days. Then count the seeds which do not show signs of growth, and from this it can be determined what part of the seed will grow. It is much better to pay 12 cents per pound for melilotus seed which will all grow than to pay 6 cents for poor seed.—J. B. N.

Gum Disease

My peach and apricot trees, planted March, 1914, look as though something was wrong with them. They are completely covered with little drops of hard gum. The leaves are perforated with tiny holes. The branches are very thick and the trees had a little fruit on them this year. Please tell me if this condition is harmful and if so, what can I do to prevent it.—Subscriber, Alhambra.

This gumming is probably not a disease of itself but an indication of a disease or unfortunate physical condition. Even a close study of the tree may not develop the exact cause. It may be due to mechanical injury alone or to poor cultivation, or a waterlogged condition of the soil may induce it.

Red Spider

I send leaf with small spider. As you will note the tissue of the leaf is almost entirely destroyed. What is it and what is the remedy?—Subscriber, Alta Loma.

This is a serious infestation of the so-called red spider, *Bryobia pratensis*. It has been given attention by many experts in the effort to secure a remedy. Probably the best remedy is the lime sulphur spray mixed with flour paste. Mr. Volck recommends: "Commercial lime sulphur four gallons, flour paste four gallons, iron sulphate two pounds, the above to be mixed with 100 gallons of water. Mix the lime sulphur and the paste before adding the iron sulphate in solution." Spraying with atomic sulphur applied

at the rate of 10 pounds to 100 gallons of water has given excellent results.

Softening Water

Commenting on our reply to a query in the issue of September 16, Dr. R. R. Snowden, chemist, writes:

"I beg to advise that having had much experience along this line, I think tri-sodium phosphate is the best water softener for laundry use, because if an excess is used the cleansing properties of the water are enhanced. One to two tablespoons in the bath improves it by removing the lime and magnesia. Sodium fluoride is also fine, but is a little more ex-

pensive, and an excess adds nothing to the cleansing properties.

"I strongly advise against trying to soften water for drinking purposes unless done by a chemist."

Fruit Juices

There have been many requests for information as to preserving of cider, grape juice and other fruit juices. For all such inquiries we would recommend writing to the department of agriculture, Washington, D. C., and asking for bulletin No. 24, Studies on Fruit Juices, by H. C. Gore. It touches upon the general principles involved in extracting, filtering, sterilizing, containers, and, in fact, all features of fruit juice preservation.

Registering Pure Breds

Regarding the breeding of pure bred stock which it is desired to register, I note in the issue of September 9, Mr. Gow's answer to the inquirer regarding registering Jerseys that no matter how pure the blood if registry of ancestors has been lost there is no renewing the registry. My impression

is that inbreeding is necessary in order to secure registry.—Subscriber, Holtville.

We think our inquirer has an entirely erroneous idea as to the necessity of inbreeding. The maintenance of the pedigree is for the purpose of preserving a history of the ancestry of the stock and if the line is once broken of course there is no replacing it. Of course in order to perpetuate and increase certain qualities inbreeding is occasionally permitted, although more often line breeding is followed.

WE ALL DO IT

"They contemplate a trip to the Frisco exposition."

"That's cheap enough."

"What? Why, the fare—"

"I was speaking of the contemplation."—Philadelphia Public Ledger.

THEY HAD TO BE

Maud—"Don't you think there are just as good fish in the sea as ever were caught?"

Marie—"I don't know. But they are smarter, anyway."—Boston Transcript.

the Cultivator Poultry Book

Poultry for Profit

by
Jean A. Koethen

PACIFIC POULTRYCRAFT SAYS:

A brand new book on poultry published by that old reliable Cultivator Publishing Co., Los Angeles. The author, Jean A. Koethen, has really written a poultry book worth while. The different subjects are treated with a directness that is refreshing, after reading so many books that say so much and mean so little. The book is intended for the beginner and farmer, but we commend it most heartily to anyone interested in poultry; whether for pleasure or profit; it is full of good things from cover to cover.

THE LOS ANGELES TIMES SAYS:

The author of this manual has covered the subject fully, giving the salient features and practices of an enlightened poultry culture as it applies to California conditions, based largely on personal experiences, and intelligent compilations from recognized authorities.

THE RIVERSIDE PRESS SAYS:

The Press is in receipt of a copy of this work, called "Poultry for Profit," and has no hesitation in commending it to either the "backlotter" who keeps a few chicks for his own pleasure, to the fancier who works to the "standard," and to the commercial poultryman who makes a business of poultry culture. Before its publication, the manuscript of "Poultry for Profit" was submitted to practical poultrymen, to experts and simple poultry enthusiasts, and all agreed that it was more comprehensive, more readable and vastly more helpful than any similar poultry book yet published. It covers the widest range, discussing breeds, feeds, diseases, housing, marketing and answers the thousand and one questions that even the expert poultryman sometimes has to ask and the amateur is ever asking.

THE PORTLAND OREGONIAN SAYS:

The Weekly Oregonian takes pleasure in recommending this book to its readers, for it is "the right stuff," told in the right way by the right woman.

"Poultry for Profit"

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

An outline of its valuable information—

Making a Beginning	Housing and Yarding	Incubation
Brooding	Feeding	Breeding
Marketing	Sanitation and Hygiene	Fixtures, Conveniences
Diseases and Vices	Ducks and Geese	Turkeys

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

\$1.00 Postpaid to any address.

\$1.75 with the California Cultivator, weekly, one year.

The Household Department

SEPTEMBER

The golden-rod is yellow;
The corn is turning brown;
The trees in apple orchards
With fruit are bending down.

The gentian's bluest fringes
Are curling in the sun;
In dusty pods the milkweed
Its hidden silk has spun.

The sedges flaunt their harvest,
In every meadow nook;
And asters by the brookside
Make asters in the brook.

From dewy lanes at morning
The grapes' sweet odors rise,
At noon the roads all flutter
With yellow butterflies.

By all these lovely tokens
September days are here,
With summer's best of weather,
And autumn's best of cheer.

—Helen Hunt Jackson.

THE DOLBERS' AGREEMENT

MARCH had been more than usually rainy, and Mrs. Dolber, picking her way across the muddy, sparsely grassed area, called a lawn by courtesy, wished in her heart that at least a part of the space might be concreted, thereby giving her a decent yard for the drying of clothes.

She rubbed her boots as clean as might be on the bedraggled mat at the back door, going in to dump the empty clothes-basket on the kitchen table.

Isom Dolber, clumping around in his stout leg-boots, hailed her as he entered:

"Well, where's dinner, Huld?" he demanded. "Think I can fool 'round here, waiting, when the spring plowing ain't half done? Guess if this place is to pay, I'll have to plow every inch and grow some sort of truck that I can sell. There's half an acre right at the back door—just waste, that's what it is!"

"But, Isom!" remonstrated his wife, hurrying the dinner onto the table, "where'm I going to dry the clothes? It's hard enough as 'tis—"

"Guess you can stand between the rows—cabbage, or beets, or potatoes. No use talking; I've got to make the farm pay," replied Isom, sitting down to dinner.

"It's dreadfully wet as 'tis, Isom, and in summer, if there's no grass it'll be dusty for the clothes. 'Course, they're not needing half an acre, but if there could be a bit of concrete for a drying yard—"

"I guess a pair of rubbers is a whole lot cheaper'n concrete. What's more, I tell you I want the ground for garden-truck, and I guess, Huld, if you'll 'tend to the house, I can take care of out-o'-doors."

Mrs. Dolber laid down her knife and fork, looking her husband full in the face. "Now, just you see here, Isom! I've heard about garden-truck till I'm clear sick and tired of it. Few years back we had a decent lawn and flowers like other folks. Then you said you couldn't be bothered with flower-beds, and the flowers had to go. You wouldn't get any grass-seed for the lawn, and it's pretty much all run to dandelions and sorrel and pepper-grass where it isn't worn clear down to gravel, 'count of walking back and forth over it, and never taking the trouble to water it, summers. Now here's where I quit!"

"Land o' compassion!" ejaculated Isom, looking at his wife in amazement. "What on earth do y' mean, Huld? 'Quit?'"

"Oh, I'm not planning for a divorce

—not yet!" responded Mrs. Dolber, sharply. "Guess as long's I've stood you all these years, Isom, I can go on standing you. When I say, 'quit,' I mean that I'm going to leave the outside of the house to you, seeing you say you can take care of out-o'-doors. Oh, yes; you can come into the house, 'course, Isom, and eat and sleep, and sit around evenings and read the paper and all that—but here I quit doing any outside chores. If you want all outdoors to yourself, you can have it—for all me!"

"Um!" responded Isom, stroking his beard. He got up from the table and took his hat. "Guess I'd better get back to that plowing."

Mrs. Dolber watched him plod away. "You're a good man, Isom," she murmured, "but there's some things you've got to learn, and the sooner you learn 'em, the better."

She washed and wiped the dinner dishes, and picking up the water-pail started mechanically for the door. As she was about to lift the latch, she halted. "Mebbe I've been back and forth to that well times enough, lugging water!" she muttered. "That's outdoor work, and I'll just leave it to Isom." Walking across the kitchen she peered into the wood-box. "Not overly much wood," she remarked meditatively, "but I guess it'll keep the fire going for the afternoon, though I don't know about supper. Well, wood's in the shed, and the shed's quite a piece from the back door. That's Isom's chore, all right!"

After a long, comfortable survey of the kitchen, cheerful in the western light, she walked over to an inviting rocking-chair that stood at the pleasantest window.

"There's the whole afternoon for sewing—just sewing!" she exulted under her breath. "Not mending—mending isn't really sewing, it's just—mending. I do love to get my needle into something new!"

Her gaze wandered out of the window to the weekly washing on the clothes-line; she half started from her chair only to drop back again peacefully. "There's another outdoor chore for Isom, when he's through plowing!" she chuckled. "Mebbe the clothes'll get bone-dry, hanging out so long, but I don't mind giving 'em an extra sprinkling."

Mrs. Dolber certainly enjoyed the long, quiet afternoon as her needle went in and out, producing tucks and ruffles too dainty for her sewing-machine that stood aloof in one corner.

"You're all right," observed Mrs. Dolber, nodding towards the machine, "when it comes to long seams or even straight hems or wide tucks, but I guess I'd best do these tucks by hand, seeing's I've plenty of time."

"Cut-cut-cut-cut-dah-cut!" came up from the henhouse, down by the barn. Mrs. Dolber laid down her needle, listening.

"Declare if 't isn't 'most time to feed those hens!" she murmured, "and there's the eggs, too—Oh, I forgot!" She picked up her work again, sewing busily.

The shadows were growing long when Isom opened the back door and trudged into the kitchen, plumping down into the first available chair.

"Tell you what it is, Huld," he panted, "this plowing certainly does take holt of me; but, my, what an appetite I've got! Hope you're going to have a first-rate supper."

Mrs. Dolber smiled placidly at her husband from her rocking chair. "I'm calculating to get you the best sort of supper, Isom, and plenty of it, but I'm clean out of firewood and the water pail's 'most empty. You'll have to bring in some wood and water, Isom, 'fore I can get supper, and you'd better look up some eggs, too, when you're feeding the hens, and—"

"My stars, Huld!" broke in her husband. "You ain't meaning—?"

"That's all outdoor work, I take it, Isom. You said if I'd 'tend to the

house you'd take care of out-of-doors, and I said I'd quit, and you could have it just as you said. That's the agreement, Isom, and I'm sure I'm willing and anxious to keep my part of it, so please hurry right along with the wood and water and eggs."

Isom set his lips grimly, marching to the door with the air of a man who is too proud not to accept the situation.

"Oh, Isom!" his wife called after him, as the door swung wide. "There's the week's washing on the line; you'd better get that in while you're about it; there'll be plenty of time before supper's ready. Here's the clothes basket."

No one could have called the supper that Mrs. Dolber set forth that evening anything but a success. The huge omelet with fragrant and abundant shavings of delicate pink ham amid its inner mysteries; the hot biscuit, cream-colored between the melting browns of the upper and under crusts; tea of deep amber; jelly that sparkled and gleamed and quivered, yielding up the very essence of the fruit from which it had been made; cake, moist without heaviness and sweet without stickiness—all of these, set forth invitingly, challenged Isom to make good his claim to an excellent appetite.

"Why, Isom!" exclaimed Mrs. Dolber, as her husband pushed back his chair after a very moderate meal. "There's nothing the matter with you, is there? You said you had such an appetite—"

"Supper's first-rate, Huldy," declared Isom, with a slightly confused air. "Guess mebbe, I've eaten enough, though. Fact is, I've a kind of hankering for bed. Might 's well go there, I guess, soon's I've done the chores."

"Well—mebbe you had, Isom," replied his wife in kindly tones. She sat for a while, busied with her knitting, after the thud of his stockinged feet in the room overhead had ceased. "I—I'd know as I'd any business to act so!" she murmured, reluctantly. "And he takes it like a lamb, too!" she muttered almost remorsefully, driving the cat down cellar and blowing out the lamp.

Waking at the usual hour in the morning, Mrs. Dolber's first conscious sensation was one of chagrin. "Declare I never thought of it!" she muttered. "Isom always built the fire mornings, and now I've got to do it!" Rousing herself a little more, she glanced about her. "Well, I never!" she ejaculated. "If Isom isn't up already!—Count of having all the outside chores to do, I s'pose."

Dressing hurriedly, she went down into the kitchen. The fire was crackling bravely in the cook stove; the table, even, had been drawn out into the middle of the floor, the cloth laid and the dishes set out upon it—man fashion, to be sure, and in need of more or less rearrangement; nevertheless, there they were.

Something rose up in Mrs. Dolber's throat, and her eyes grew misty. "And me driving him around yesterday as if he was a slave!" she murmured, remorsefully.

She hurried to the kitchen window and looked out on the debatable half acre. There was no sign of any plow; only Isom on his knees cutting away at the sparse turf, while a heap of sods were piled at his side.

Disregarding preparations for breakfast, Mrs. Dolber hurried out to her husband. "It—it was real clever of you to make the fire and—set the table, Isom," she murmured shyly. "Neither of 'em was yours to do, 'cording to agreement, and—"

"I guess, Huldy," replied her husband, turning slowly towards her, "that the agreement you're telling about don't stand. There's a good deal bigger agreement that goes clear back to the time I put that ring on your finger, and there's nothing in that agreement 'bout dividing up duties nor rights, but just sharing 'em. Leastways, that's the way I sense it, come to think it over."

Mrs. Dolber drew a long breath. "You—you're taking off the sod before plowing, Isom?" she asked with apparent irrelevance. "Now, I should think—"

"Well—yes!" interrupted Isom, slowly. "I am kind o' taking off the sod, Huldy. But I ain't calculating to plow this half acre; I can scrape along without it. I'm kind o' planning to concrete a piece of it near

the back door, where it'll be handy for drying clothes, and mebbe I'll take some more off, here an' there in spots, so's we can have some flower beds, like you was telling about yesterday, and water laid in the kitchen, I guess, and a hose for watering 'em."

Mrs. Dolber gasped. "Water laid on? And a hose?—Oh, Isom!" her breath came short and quick.

"There, Huldy, there! It's all right! Guess we'd best go in and have breakfast. No, Huldy!" he went on, in answer to the smile that drew up the corners of Mrs. Dolber's mouth and made her eyes twinkle. "I ain't going to carry the sharing so far's to try to cook the breakfast, 'cause when it comes to cooking—and a whole lot of other things, too, Huldy!—you're surely clear 'way ahead o' me!"—Successful Farming.

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Warm Baked Pears
Bacon and Egg Omelet
Cream Griddle Cakes—Honey
Coffee

Lunch or Supper

Vegetable Chowder
Baked Rice, Spinach with Bacon
Raisin Gingerbread—Crabapple Butter
Tea or Milk

Dinner

Boiled Ham, Sweet Potatoes Southern
Creamed Tomatoes Corn Bread
Chocolate Cake Fresh Fruit
Coffee

Cream Griddle Cakes

To one cup of buttermilk add a pinch of soda, one-half teaspoon of salt, one teaspoon of sugar and flour for a thick batter. Beat until smooth, then thin to the desired consistency with sweet cream. Lastly add a teaspoon of baking powder and bake at once on a hot griddle.

Crabapple Butter

Select well ripened crabapples, cut them up without coring or peeling them and place them in a graniteware kettle with enough water to cover them. Boil them slowly until they fall to pieces; then press them through a graniteware colander. Add the pulp to the water in which the crabapples were cooked, and for each quart of pulp add half a pint of pineapple juice. Also add enough sugar to sweeten the butter, and allow the mixture to simmer until thick. Then boil, stirring it constantly, until it is perfectly smooth; if it becomes too thick in the meantime, add a little more pineapple juice. Seal in glass jars while boiling hot.

Boiled Ham

Boiled ham, to be at its best, requires very slow cooking. Put the ham in a kettle, cover it with cold water and let it soak four hours. Take out, wash thoroughly, scrape and clean off the hard edges of skin. Put back in the kettle, cover with cold water and let simmer until the meat is tender when tried with a fork. A ten-pound ham will require about five hours cooking in this way. Remove from the fire and let stand in the water for an hour, then take from the water and remove the outside skin. Sprinkle the ham with granulated sugar and cracker crumbs, a dash of paprika and insert two or three whole cloves. Put in a slow oven and bake for one hour.

Chocolate Cake

Take a cup of brown sugar, add a half cup of sour cream, a half teaspoon of soda, one egg well beaten, a cup and a half of flour sifted with a teaspoon of baking powder. Dissolve two squares of chocolate in half a cup of boiling water and add to the cake the last thing. Flavor with vanilla and bake in two layers or in a small loaf.

HOUSEHOLD QUERIES

Candied Figs

Please give recipe for transparent candied figs similar to those sold in Christmas boxes. My formula has been to dip in boiling water until the fruit turns yellow, then drain. I cook two cups of sugar and one of water until it threads and cook the figs in

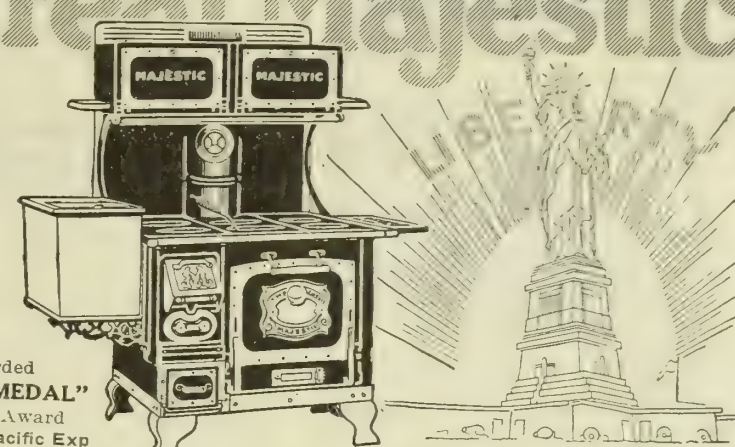

this for ten minutes, then drain on platter, repeating the process each day for eight days, but the figs shrivel up and turn dark about the fourth or fifth day. Can you tell me where I can get a book of recipes for candying all kinds of fruits?—Subscriber, San Gabriel.

Possibly you have dipped the figs too often, the heat from the boiling syrup causing them to shrivel. The following recipe for candied figs appeared in the Cultivator of July 23, 1914: Use figs not yet fully ripe. Place in glass jars, pour on salt water and steam until soft. Pour off the salt water and pour over the fruit a syrup made of one cup of sugar to three of water. After a day take out, place on wire screens and allow to drip for one or two days in a warm

place. Place again in jars or earthenware, cover with a syrup made of one cup of sugar to one and one-half cups of water and leave for one day. Then take out and allow to drain, after which cover with a syrup made of one cup of sugar to one-half cup of water. Allow the figs to remain in this as long as possible, or until required. Take out, drain and roll in confectioner's powdered sugar in a pan made lukewarm. Pack away in boxes in powdered sugar.

Recipes for the candying of fruit are given in Marian Harland's "Complete Cook Book;" also, we believe, in the "Encyclopedia of Cooking," by Cassell. These may be obtained at your bookstore.

Freedom from Kitchen Drudgery

A Majestic means freedom from baking failures; freedom from fuel and food waste, freedom from frequent repairs—freedom from the expense and annoyance of the ordinary range or cook stove.

The Majestic is the sure baker—its scientific construction forces the heat to every part of oven and its asbestos lining reflects the heat onto all parts of the baking. Bread is baked and browned perfectly, top, sides and bottom, without turning.

The Majestic is made of non-breakable, malleable iron and charcoal iron that resists

rust three times longer than steel. The oven is kept tight, permanently, by cold riveting (not bolted or clamped)—no cracks to be putted. The heat is held in, and maintained, with less fuel.

The Majestic's economy of fuel, food and repairs, its perfect baking results, and the years it outlasts the ordinary range—prove the wisdom of paying the slightly higher Majestic price.

There is a Majestic dealer in nearly every county of 42 States. If you don't know the one near you, write us.

One quality, many styles and sizes, with or without legs.

Write for Book.

Tells what to look for and what to avoid when buying a range. You can't judge a range by looks. You should know how it is made and why. Write for free copy.

The Tenth Year of Cumnock Academy Opens September 28

Parents who are planning to have their daughters enter the school this year should consult immediately in regard to registration. Call, telephone or write for complete information.

Cumnock Academy

is an accredited school, its graduates being admitted to the better universities and colleges without examination. Two courses are offered—college preparatory and general. Carefully chosen faculty, whose work is supplemented by special courses given by the CUMNOCK EXPRESSION SCHOOL faculty.

A sub-preparatory department, offering the seventh and eighth grade subjects, is also maintained.

Cumnock Academy occupies beautiful buildings and grounds in a charming, retired location. All outdoor sports—gymnasium, basketball, tennis, horseback riding. Limited number of boarding students. Write for catalogue.

CUMNOCK SCHOOL OF EXPRESSION

Twenty-second Year Begins Oct. 4

All phases of Literary Interpretation—Story Telling, the Dramatic Art, Public Speaking, Art Appreciation. Write for Catalogue.

HAY

Under date of September 18, 1915, Scott, Magner & Miller say:
Receipts for the past week were 3688 tons, the previous week 4047 tons and the week preceding that 5311 tons. The natural inference from decreased receipts is that fields are becoming cleared rapidly and we believe that within the next two weeks receipts will drop off materially. Usually we can figure hay from the fields for at least 45 days longer, but this year gives every evidence of the fields being cleared by the end of this month. The market is firm on all grades; even the poorer grades doing better than heretofore. An advance is noted in choice grades. All receipts have moved off readily.
The receipts have consisted mostly of medium and poorer grades, very little choice hay of either variety having been

WEATHER CONDITIONS

For the Week Ending September 18, 1915.

Report from the various California stations of the United States Weather Bureau by George H. Wilson, director, San Francisco.

Rainfall Data

Temperature Data

	Past Week	Seasonal to Date	Normal to Date	Maxi-mum	Mini-mum
Eureka	.02	.28	.71	66	48
Red Bluff	.00	T	.25	94	54

Los Angeles	.00	.00	.00	82	56
San Diego	.00	T	.00	72	52

in evidence and whenever offered has sold readily at top quotations. Not only is it generally conceded that our own crop is decidedly short but we are in receipt of advices from a prominent Southern California dealer and quote him as follows: "Grain hay situation in Southern California will be the shortest crop for several years." This, together with reports from Seattle, Washington, of a similar nature only goes to confirm our belief of higher prices during the winter and spring months for our own crop.

Alfalfa from the river districts finds ready market and is selling at top quotations. Interior hay will not be sought for until the river districts are cleaned up. Straw continues to lag and very little interest is shown in this commodity.

Citrus Fruit Market

LOS ANGELES, CAL., Sept. 22, 1915.

The orange market continues strong. Present conditions almost assure good prices until the end of the citrus year, which is October 31st. There are not more than 1200 or 1300 cars. This amount will be readily absorbed by the market.

The lemon market is making a belated effort to redeem itself; this because of a streak of hot weather which has been given to nearly all sections of the East. The shipments are, however, being held down and it is to be hoped that the good prices which are now being obtained will prevail for some months.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914, 31,887, lemons 6345, total 38,232. To same date last year, oranges 36,586, lemons 2707, total 39,293. From Tulare County and Central California points, oranges 5649, lemons 202, total 5851; to same date last year, oranges 5875, lemons 302, total 6177. Butte and other Northern California points, oranges 630, lemons 2; last year to same date, oranges 404, lemons 5.

NEW YORK, Sept. 20.—Thirteen cars Valencias, five cars lemons sold. The market is strong on both oranges and lemons. Weather fair.

ALPHA COMBINATION POWER SPRAYER

CONSTANT HIGH PRESSURE is easily maintained with the ALPHA AUTOMATIC PRESSURE CONTROLLER.

When desired pressure is reached the pump automatically ceases operation. The engine idles. Again resuming operation when pressure drops below point at which it is set.

Does away with need of relief valves, diaphragms, etc., which are soon put out of commission by the corrosive action of the spray material.

Just what you are looking for.

A WARM INVITATION

The Supreme Court of Illinois, in *Aulger vs. the People of Illinois*, 34 Ill., 486, held that the following was not a challenge to fight a duel, but seemed rather to invite one:

"Sir: It appears that a wife is your favorite of settling fuses and if so bea the case you can consider that it will suite me you are a Coward and darsent to except of my offer. iwant the same chance of sharpening mi wife you can set your day and I will be on hans. . . . come uplike a man chuse your man an I will chuse mine this thing must be settled iam not a coward."—Chicago Tribune.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department. Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115 1/2 N. Broadway, Los Angeles.

Responsibility for Stock in Pasture

Last March I placed 19 heifers in pasture upon the inducement of the pasture owner who promised to look after the stock, count and water the same and report any illness. Three months later I visited the pasture and found no water and my stock suffering, which I referred to the owner and he promised to see that that would not occur again. On the 13th day of August I removed stock, at which time all the stock in the pasture were bellowing around an empty water trough; my heifers were thin and had lost from \$10 to \$15 per head. Is the owner of the pasture liable for the condition of my stock?—Subscriber, Lindsay.

An agistor or keeper of another's stock is required to exercise in any event reasonable care and diligence and he is liable for any loss or injury where there is want of such care upon his part, whereas in this instance the agistor has been negligent in caring for the animals, especially after an express agreement upon his part, is clearly responsible for the loss which you have suffered.

Homesteading Right Lost

When one has only had a homestead of 160 acres, is it possible for them to take another 160 acres? My husband had 160 acre homestead and after proving upon same sold it. Now could he or I take another homestead?—Subscriber, Santa Maria.

Any person who prior to 1911 made entry under the homestead or desert land acts but who has subsequently lost, forfeited or abandoned the same shall be entitled to the benefits of the entry laws as though the former entry had not been made, but any person applying for a second entry must furnish a description and date of the former entry. The provisions of the act do not apply to any person whose former entry was cancelled for fraud or who relinquished his former entry for valuable consideration in excess of filing fees paid for him upon the original entry.

Homesteading Requirements

If I file on a homestead and fail to locate on the land within six months do I lose the right I gained by filing? Can another party file on the same land after six months, without contesting my rights?—Subscriber, Devore.

If at any time after filing the first affidavit and before the expiration of the tree-year period it is proved to the register of the land office after notice to the settler that the entry man has failed to establish residence within six months at any time, then the land shall revert to the government, provided, however, that a commissioner of the general land office may allow the settler twelve months from the date of filing within which to commence residence.

SEPARATORS, ENGINES, SPREADERS
200,000 customers testify that my designers and factories build quality into them. Built for long, hard, continuous users' satisfaction. HIGHEST QUALITY—LOWEST PRICES. About 1-3 to 1-2 less than you usually pay. Don't buy till you get my catalog of these and other farm and household goods free. A postal note to Wm. Gallows Co., Box B, Waterloo, Ia.

Increase the Efficiency of your Farm Equipment—by Buying this \$585 Tractor and Portable Engine!—

F. O. B. MINNEAPOLIS, MINN.

The modern farm is a "food factory," which must be conducted on the same efficiency basis which rules in all other big industries. Make your farm more PROFITABLE. Cut down the work you have to do. Sell most of your horses, save the expense of their upkeep, not to mention the investment—let a couple of your hired men go—buy a Big Bull Farm Tractor and put your land investment ON A SOUND BUSINESS BASIS.

Big Bull is a powerful lightweight Tractor,

built especially to do ALL traction work on the farm. Big Bull is making money for farmers in all sections of the country—6500 Big Bull Tractors in use today. Put this economical power machine on your farm and let it do ALL the work. Big Bull does ALL your plowing, discing, seeding—runs manure spreaders, pulls hay loaders, mowers, binders—runs pumps, feed grinders, small shredders and threshers. Big Bull acts as an ever ready PORTABLE engine, saws wood, runs your cream separator, etc.

"BIG BULL"

Produces 20 Horsepower at the Belt. 7 Horsepower at Drawbar

Why not buy a "Big Bull" NOW and increase the productiveness of your soil 100% by DRY PLOWING IT? Extreme heat makes the use of horses impossible. It never affects "Big Bull."

BIG BULL plows deep and thoroughly! Plows within 12 inches of ANY fence—practically turns corners on a pivot. Has DIRECT, single drive, with only 4 gears. Bull wheel runs IN THE FURROWS, yet does not pack down the soil. This means crop increase. Grouser four inches long on the bull wheel make it a deep-tilling SUB-SOILER. Hardest kind of sub-soil is easily penetrated, turned over, made ready for irrigation. Steer wheel of Big Bull runs IN THE FURROW IN A DIRECT LINE with the bull wheel. This makes Big Bull positively and automatically self-steering.

Don't buy a tractor that hasn't absolutely PROVEN what it can do! For two years Big Bull Tractors have made remarkable plowing records, working under the severest strains in the worst type of soil. Big Bull is exactly what California, Oregon and Washington farmers have wanted. It is the answer to the great question: How can I DECREASE the cost of my crop production, and at the same time INCREASE my profits?

FILL OUT THE COUPON BELOW. MAIL IT TODAY. GET OUR FREE TRACTOR BOOK. LEARN WHAT THE BIG BULL CAN DO FOR YOU!

LET THIS ENGINE REDUCE YOUR HIGH-COST-OF-LABOR

The only way for a farmer to keep up with the always increasing cost of doing business, is to take advantage of the many MECHANICAL AIDS now provided for his benefit. In fact, no farmer who wants to do the most work in the most economical way can afford to be without a

FULLER & JOHNSON TYPE "N" GASOLINE ENGINE

To supply CHEAP POWER for operating an Alfalfa Cutter, Cream Separator, Churn, Corn Sheller, Electric Dynamo, Feed Grinder, Grind Stone, Ice Cream Freezer, PUMP, Spray Pump, Washing Machine, Wood Saw, or ANY FARM MACHINE equipped for power-drive this engine is a NECESSITY.

THE FULLER & JOHNSON TYPE "N" ENGINE is different from most engines. 1st—it is the product of 13 years of business and manufacturing experience, backed up with a world-wide reputation for QUALITY; 2nd—it is made in modern shops equipped with the finest machinery, by unusually high-class mechanics; 3rd—IT COMBINES THE GOOD POINTS OF HIGH PRICE ENGINES IN DESIGN, MATERIALS AND WORKMANSHIP—all the latest improvements—yet sells for a surprisingly low price; 4th—it is very, very simple, has few parts, is easy to start and run—by anyone; 5th—it has only one-fourth the weight of engines made from antiquated patterns—an is more easily portable; 6th—it has “make-and-break” ignition, a “hit-and-miss” governor that keeps its speed constant and permits it to use very little fuel; 7th—it operates on the superior 4 cycle principle and cools itself perfectly; 8th—it runs equally well on gasoline or engine distillate.

The work the different sizes of this wonderful engine will do for you and the amount of money it will save will surprise you. You CAN'T AFFORD to be without it.

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

Discussion at the San Francisco Session of the International Congress of Irrigators.

Written for Cultivator Readers by R. P. Dougherty

TUESDAY, September 21, was Rural Credits Conference Day at the P. P. I. E. There was a mass meeting at Festival Hall, presided over by Hon. Chester P. Rowell, editor of the Republican, and a member of the commission appointed by Governor Johnson last winter to study proposed legislation on rural credits. Addresses were made by Myron T. Herrick, formerly our ambassador to France, by Prof. Elwood Mead of our state university, recently in the service of the government of Australia, by Senator James D. Phelan of San Francisco, by James Madison, manager of the California Raisin Growers' Association, and by Colonel E. J. Watson, president of the Southern Cotton Congress and the National Drainage Commission. In the evening a round table conference was held to discuss the points made by the speakers of the afternoon and consider future action of those interested in the rural credits movement.

A committee was appointed by Chairman Rowell to report at the round table conference on methods of centralizing and organizing a national rural credits movement. This committee consisted of Prof. Elwood Mead, Mortimer Fleischacker, C. E. Wooster and C. E. Crunsky.

The Land Credit System

Former Ambassador Herrick was the first speaker. His address was given in part in the Cultivator of last week and is continued in this issue.

Throughout his address he advocated the landschaft system, based on land credit. "The landschaft banks in Belgium, in France and in Germany," he said, "are practically self-sustaining because they have adopted the scheme of financing their land as other business is financed. Cooperative organizations are not benevolent institutions for helping the down and out; they only help him who is able and willing to help himself. Cooperation is the quickest way to success for the humble as well as the high, but its liberal interpretation is mutual self help; it requires ability both to give and receive. It will succeed best among those who ask no favors and rely upon their own ability, toil and resources. State aid would be as harmful as it is unnecessary."

Rural Credits in Australia

Dr. Mead spoke of the operation of rural credits in Australia, giving especial attention to the system as worked out in the state of Victoria. He said:

"The island continent of Australia is of about the same size as the United States, settled by emigrants from Great Britain, largely English and Scotch, having the same language, the same social and political ideals and the same tendency toward independence and individual action. So far as

its natural advantages are concerned they are in no wise superior to ours. Australia is separated from its markets by seven to twelve thousand miles of ocean and suffers from the disadvantages of a light and variable rainfall. In many ways it is comparable to the western third of the United States. During the first half century agricultural progress was slow; it did not keep pace with the United States. Then came the event that cut the economic history of Australia like a knife. This was the passage by New Zealand of a rural credit law regarded by the conservative English and Scotch as exceedingly dangerous. Now the six Australian states all have in operation rural credit systems; interest rates to the farmer have come down to about half what they are now in the United States. With the opportunity for long time, amortized loans, much gain has been made in agriculture; farmers are able to buy better stock and better tools; they are able to build better houses and better schools. Taking the 20 years preceding and the 20 years following the adoption of the rural credits systems they have led all countries of the world in increase of production and in increase of exportation.

"All six states have the same fundamental system. In Victoria the rural credits are handled by a state savings bank. It has behind it the government guarantee but its management is entirely apart from political influence. So efficient has been its management that 735,000 out of a population of a million and a half are depositors and it has a fund of \$20,000,000. "The system adopted is that of the credit foncier of France. Loans are made at 5 per cent with annual amortized payments of 1½ per cent on 30 years' time.

"For several years rural credits in Australia were confined to meeting the needs of already well-to-do people, the men who were able to give first mortgage security; those who owned property and wanted money to improve it. But there was another class in the young and undeveloped country which needed assistance, the men who had no farms and wanted to buy them and who, for the welfare of the state should be assisted to buy, sons of farmers, tenant farmers and city men who wanted to become farmers.

The first step was the purchase of estates where already there was demand for land, usually by the sons of well-to-do farmers. To handle this a "Closer Settlement Board" was formed with power to purchase lands and sell to settlers on the easy, long-time payments already outlined. Out of the 20,000 acres of land so purchased over a half million has now passed into the hands of owners.

"The most significant feature in the agriculture of Australia is the develop-

ment of its irrigation systems. When I went to Australia they were losing \$2000 a day. The land holding averaged 600 acres; there were not enough people to cultivate them; there was no market for the water. The state (Victoria) determined to undertake an investigation of other irrigation systems and sent the minister of lands and myself to Europe. There we found the great feudal estates in Italy, which had been almost depopulated, being transformed into prosperous ranches. There the people had no land; they had to have the money to acquire land. In Denmark one-sixth of the farmers are aided in buying directly by the state. In Ireland it is not the cooperative associations that will transform that country but the \$40,000,000 furnished by the British government to buy lands and build houses. Germany in Poland, where conditions are like those of the western third of the United States did not employ the landschaft system but the state aid policy of Australia.

"The state of Victoria decided that it was essential that the settler should have a living income the first year, that he should have money to build a house, to level and prepare his land and then it stood ready to make loans on improvements made with his own capital to tide him over the three or four difficult years.

"Not from the beginning has there been any question of the success of this plan. It has created a scientific agriculture. 40 acres today is as much as ten times that under the old plan. And the whole thing has been done without expense to the taxpayers.

"What do we do for the settlers on our irrigated lands? Let me describe two instances:

"Three years ago there came to Australia from the Imperial Valley a man with a capital of \$600. He was a man of character and experience. The state gave to him the same opportunities it gives to all. It sold him 50 acres at \$80 an acre, including a house. He made the customary payment of 3 per cent. The state leveled his land and seeded it to alfalfa. Within a month he was living in a comfortable house and his farm was in condition to bring him in an income. It was ready for sheep pasture. Then a commercial bank financed him in buying the sheep. The first year he made \$1000 after making payments on his land and water to the state. The next year he made \$2000.

"At the same time another man came to Nevada from Wisconsin. He got 80 acres for nothing. With him he brought \$2000, three times the capital of the man going to Australia. He spent \$300 for a house, \$100 for a stable, \$100 on fencing; bought a team; then began without any aid or direction the unfamiliar work of leveling the land. At the end of a year

he had 50 acres leveled, no crop, no money, no credit and nowhere to turn for assistance. He had to leave his farm and go to work for wages.

"Too many systems of rural credit stop with the man who has his land and credit. There can be no successful credit system for the man who has not acquired land unless it has behind it the state credit and the state's management and direction."

Proposed Legislation

Senator Phelan outlined the movements already made toward rural credit legislation in California and by the federal government. He spoke of the commission appointed by Governor Johnson to gather information to present before the next session of the state legislature and of the federal commission which visited Europe to perform the same service for the federal congress. As our three principal parties stand pledged to rural credit legislation, the speaker stated that it appeared reasonable to suppose that some legislation of this kind will be put through by the next congress.

Senator Phelan said: "The town man gets money at two or three per cent and gives short time paper. But the principle of all rural credit legislation is long time paper. In Denmark the farmer pays five per cent interest and may have 30 or 40 years to pay for his land. The government must be used to bring about this condition; no banker could foresee the condition of the money market 30 or 40 years hence. The banker is in the business of making money; he is not a philanthropist. It is the duty of the state to put men on the land and maintain them in reasonable prosperity."

Cooperative Marketing

Mr. Madison asserted in most positive terms that "it is of no value to put a man on the land unless he has some working capital; that is where most farmers meet their Waterloo. He needs money for a short time and needs it badly; his crop practically all matures at one time; he has to sell it and take what he can get. The only way to do it until he gets a working capital is through cooperation.

"The raisin association is formed on fundamentally right principles, that is, of having a working capital. Two years ago raisins sold at two cents a pound because everybody had to sell at the same time; since the organization of the association the growers get approximately four cents. Saving the state of California this \$6,000,000 will keep more farmers on their farms than any rural credit you can establish. The money will be used in other and kindred enterprises, making the farmers prosperous, and at reasonable prices, not exorbitant. The raisin consumer pays less while the producer has dou-

COVER CROP

L

AST year considerable concern was felt as the war was involving practically all Europe and activities were carried on to a great extent directly in the countries and sections from which the seedmen of the United States have been accustomed to draw their leguminous seeds for cover crop purposes.

With thousands of acres of crops destroyed and practically all able help taken from the fields, European countries were unable to export enough cover crop seed such as vetches, clover and lupines to supply the demands of the American growers even to a slight degree.

The growers of citrus and other fruits in California have progressed with their industry and in consequence have long since come to the conclusion that cover crops constitute an economical means of protection for their soils during the winter months as well as a supply of plant food when once plowed under. Burr clover and another clover only recently used for this purpose, Melilotus Indica or yellow blossom sweet clover, are both adapted to our climatic and soil conditions. The citrus experiment station at Riverside has been growing the clover for the past five years, comparing it with other cover crop seeds. It was generally conceded that Melilotus Indica would save the situation. Those who grew it during 1914-15 were favorably impressed.

It is an exceedingly deep root plant. Its nature is to establish its rooting system first. After coming through the surface the plant stands at a height of five or six inches for possibly eight weeks. It sends its long tap roots straight down meantime and penetrates the plow-sole that might exist from shallow cultivation and renders the subsoil thoroughly porous. This porosity enables the water to penetrate.

The plant is a splendid producer. The tonnage obtained in a grove depends largely of course upon the actual area planted. For instance an older grove leaves less planting space than does a young grove. But taken as an average it has been found that 10 to 15 tons of green material is obtained. This means an equivalent of at least three tons of dry mulching material. Taking into consideration the cost of the seed, it makes by far one of the most economical cover crops we have.

The adaptability of melilotus to the various climatic and soil conditions is an important factor. Melilotus Indica grows right through the cold season, not being retarded at any time during the winter. Soils vary from a sand to heavy adobe in different sections and still every place that the clover has been planted it has produced.

The citrus experiment station at Riverside has recently issued a valuable pamphlet on Melilotus Indica, written by Mr. W. M. Mertz, field superintendant, in which is given the details of experiments covering a period of five years.

The best time for sowing is sometime before October 15, but not earlier

than September 1. The seed may be drilled in or sown broadcast, as equally satisfactory results are usually the returns. Sow at the rate of 10 to 12 pounds per acre when drilling and 25 to 35 when broadcasting. Bear in mind that the seed must be sown shallow, not to exceed one quarter of an inch at the most. In the older groves say 20 to 25 years old only 12 or 15 pounds of seed will be required.—Harry R. Mitchell.

FORTY-SEVENTH STATE CONVENTION

The Forty-seventh State Fruit Growers' Convention will convene at Visalia, Tulare County, November 18th and 19th.

Tulare County, though one of the first fruit-growing counties of California, has never been favored with one of the fruit growers' conventions.

There has been a loud call for thorough discussion of marketing, insect control, cover crops and mulching, control of scale insects, and leaf hoppers. Each of these topics will be led by authorities and given considerable time on the program. The County Commissioners will hold a meeting at same time.—A. J. Cook, State Commissioner of Horticulture.

CULTIVATION IN FLORIDA

We have from Mr. Henry A. Marks of Winter Haven, Florida, a photograph taken from his veranda looking down between rows of his orange grove, showing an ideal condition as to soil tillage. Mr. Marks writes that clean cultivation of the soil is kept up from February until about the middle of June when the rainy season begins. We take it that after that native growth is allowed over the surface, and we doubt not that is the reason Californians as a rule have the idea that Florida cultural conditions are materially different from those which prevail in California.

Guarantee

"We warrant all trees and plants to be good, thrifty and true to label, but having no control over them after delivery to the transportation companies, or over the planting and care after they are received by the buyer, we will not be responsible in any other direction than as stated, and accordingly, if any tree or plant should prove untrue to kind, we will either replace same or refund the amount paid; but in no case will we be liable for any sum greater than the amount originally charged, and this statement is due notice to buyers of the extent of our responsibility for trees and plants after delivery and acceptance by the buyers."

Does the above statement appearing only in nursery catalogues exempt a nursery from liability where trees prove untrue to name? Does it effect the purchaser where the statement has not been read by the purchaser? What is the value or purpose of such a clause?—Subscriber, Santa Ana.

In sales of seeds, plants, trees and other merchandise of that character there are the following warranties implied by law:

First, One who sells or agrees to sell goods by sample warrants the bulk to be equal to the sample.

Second, That one who, knowing the buyer relies upon his advice or judgment, sells personal property warrants to the buyer that neither the seller nor his agent, employed by him, knows the existence of any fact concerning the thing sold, which would to his knowledge destroy the buyer's inducement to buy.

Third, One who sells merchandise inaccessible to the examination of the buyer warrants that it is sound and merchantable.

Outside of the above warranties any warranty relied upon by the purchaser or any limitation of the warranty relied upon by the seller must be in the contract of sale; that of course does not mean a formal written contract document, as a contract may be made up from different letters or circulars, but in all such instances in order that nurserymen would be entitled to rely upon the limitation it is the opinion of the writer that it is necessary for the nurserymen to show that such limitation of the warranties implied by law is actually brought

home to the knowledge of the purchaser prior to purchase. It is easy to be seen that a mere replacement of the tree, which perhaps would not prove its kind for three or four years would be but a poor relief. With the most careful nurserymen the above clauses are frequently used, but they are placed not merely in catalogues, but upon the different parcels sent out from the store or nursery; in that case the buyer is of course put upon his notice that he can either take the goods upon the basis on which the nurseryman is willing to sell them or if that is not satisfactory, he can do business with other parties, but such nurserymen make every effort to bring home to the buyer precisely the terms of the contract, which they are willing to make and a different question is present than in the case of nurserymen who merely place a notice in their catalogue, which may not come to the attention of the buyer.

We may add that all nurserymen feel compelled to use these forms of guarantees for the reason that orchardists are so negligent in their planting operations that it's a necessary protection. However, we have known of cases when a mistake has been made—and not entirely in the nursery—and yet the nurseryman has made good to the entire satisfaction of the planter.—Ed.

Separate Property of Man and Wife

What is the separate property of man or wife acquired before or after marriage, and are profits of same separate property?—Subscriber, Pomona.

All property owned before marriage and that acquired afterwards by gift, bequest, devise or descent, together with the rents, issues and profits of such property so acquired is the separate property of a wife, the same rules define separate property of the husband.

Trust Deed as Security

When a trust deed is given on a piece of property to secure a note, what is the usual procedure followed to foreclose when the note becomes due? Will the property have to be advertised and sold to the highest bidder or can the person holding said note take over property without notice?—Subscriber, Sherman.

It is almost invariably the case that a trust deed provides that a demand shall be made upon the maker of the note for payment and that thereafter a notice of sale of property shall be published for such period as is designated by the trust deed in a newspaper published within the county, within which the real property is located, which notice gives a description of the property and of the parties to the trust deed and mentions the date when the sale will take place. On the date advertised the property is sold to the highest bidder and there is no equity of redemption on trust deed sale.

Mortgage, Chattel Mortgage, Etc.

What is the difference between a mortgage and a chattel mortgage or deed? If a place is sold to settle an estate with the heirs, have the heirs a year to redeem it back in?—Subscriber, Bachelor.

A mortgage is a contract by which specified property is hypothecated for the performance of an act without the necessity of the change of possession. The word "mortgage" standing alone usually has reference to a lien upon real property, whereas the words "chattel mortgage" refer to a lien upon personal property. A deed in the common acceptance of the term, usually means an instrument whereby real property is transferred. In case of a sale of real property under partition proceedings in the superior court, a purchaser of the property upon confirmation of the purchase by the court acquires absolute title to the property. The year of redemption applies only to sales of real property under execution.

WALNUT PRICES

It is the custom of the California Walnut Growers' Association to issue circulars to the trade which give information as to crop and trade conditions. Circular No. 1 was quoted in our columns a few weeks ago. Circular No. 2 is just out and announces that prices will be named September 30 but not in time for us to give to our readers this week. However, as to general conditions and especially as to the new carton method of marketing we quote:

"It is going to be our policy to name a price this season which will prove attractive and which we hope will develop a firm market. As we are contemplating a crop 40 per cent heavier than last season we realize that the prices we name must be low enough to permit of a larger than usual consumption of California walnuts and one that will permit of each of our customers handling a much larger volume of California walnuts than they handled last season.

"In our circular letter of August 1st, we gave you our estimate of the crop as 13,200 tons. Since that date there has been some additional dropping of immature nuts and a short spell of slightly unfavorable weather. This has reduced our estimate to between 12,500 and 12,800 tons, which figure is still much in excess of last year's tonnage. It is now certain that the harvest will be fully 10 days later than it was last season. The bulk of the shipments will undoubtedly move during the last half of October but in some sections packing houses will not open until October 15th. In 1914 the last of our shipments were ready to move on Nov. 7th. It will be at least the middle of November before we are able to close this season.

"We have been advised that reports are being circulated in some markets to the effect that the quality of the

develop this figure on account of the larger openings in the graders segregating the No. 2's from the No. 1's.

"We are aware that some of our competitors have again this season announced prices ahead of us. In this connection we desire to impress upon the trade that this Association, together with a few of the smaller associations not affiliated with us, but which operate along similar lines, control probably 80 per cent or more of the California walnut crop. In these associations it is the growers themselves, through their Board of Directors, who name the prices. Encouragement given commercial shippers by purchasing California walnuts from them at a firm figure before the Association announces its price, naturally influences the Association's growers' ideas, and oftentimes causes them to announce a higher price than they would consider otherwise. It should be borne in mind that commercial shippers' opening prices last season which were announced before ours, were higher than our figures. Is it not reasonable to presume that a similar condition will develop this year? When the commercial shipper sells a grade of walnuts at a firm price before Association opening prices are announced, he usually covers by purchasing from a grower. Naturally the price he pays the grower influences Association members' ideas and it is quite difficult to reconcile them to the lower prices which the Association often wishes to name. Undoubtedly lower prices would usually prevail if these early firm quotations were discouraged.

"We now have a fairly accurate estimate of the French crop and we give you herewith a set of comparative figures which we consider thoroughly reliable. We have two salaried agents in Europe gathering statistics for us, whose reports are checked against each other. We believe our foreign service cannot be improved.

"Cable received under date of Sep-

	Output—1914	Estimate—1915	Increase
Franquettes and Mayettes:			
Unshelled	14,500 bags		
For Shelling.....	56,000 bags	83,000 bags	23%
Marbots:			
Unshelled	30,000 bags		
For Shelling.....	90,000 bags	125,000 bags	4%
Cornes:			
Unshelled	56,200 bags		
For shelling.....	18,800 bags	80,000 bags	6%
Lots:			
Unshelled	6,000 bags		
For Shelling.....	24,600 bags	30,000 bags	Nothing

California walnuts will not be satisfactory this year. This report undoubtedly originated in the east, several thousand miles from the point of production, and is absolutely unfounded. From all appearances at this time our quality should be at least equal to that of last year and owing to the larger graders installed in every one of our packing houses, the sizes of the various grades should average larger than last season. We believe that the cracking standard we will guarantee will be very close to if not identical with that of last season. The report has also gone forth that there will be 40 per cent of No. 2's. This is also very inaccurate. Our prediction is that the crop will not average over 15 per cent to this grade and will only

tember 18, 1915, given in francs which we have translated into American money on a basis of 17.35c per franc figures prices to the New York importer, duty paid, as follows:

lower than it did last season, it would seem that California walnuts will prove particularly attractive this year. We just received a cable this morning advising of an unusually hot spell in the Bordeaux section, which may or may not cause some damage to the crop. Our latest information is that shipments from France for America will commence about the 20th of October. This is earlier than last year. It should be remembered, however, that practically all of the early arrivals last year were rejected on account of quality, the goods evidently having been shipped without allowing sufficient time for curing.

"We are pleased to state that since announcing in our last circular of August 1st, our new package of Diamond Brand walnuts in No. 1 and No. 2 size cartons, we have received firm orders for over two million two hundred thousand packages."

GRAPE MILDEW IN SOUTHERN ARIZONA

In answer to a question as to whether the Thompson Seedless grape or other grapes in the Casa Grande Valley or the Salt River Valley of Arizona are given to mildew, Prof. J. J. Thorner, botanist, University of Arizona agricultural experiment station, says: "I may state that on only one occasion have I ever seen any grape mildew in Arizona and I have seen a great many grapes grown. This particular instance of mildew was in the Salt River Valley, where the plants had been persistently overirrigated and where the soil was drenched with water most of the time. The vines were yellowish from overirrigation and there were several plants which were very badly mildewed. I should say also that the soil was exceedingly heavy and not well adapted to grape growing. These grapes were getting perhaps three or four times as much water as they should have had, and it is not surprising that they were mildewed. There is no occasion for grape mildew in Arizona with proper culture. The Thompson Seedless grape is a great success in the Salt River Valley and it should be equally successful in the Casa Grande Valley. I have never seen it growing there but have no hesitation in making this statement."

DO SOMETHING

Touching upon the matter of securing action in the matter of marketing our products we have the following from Leslie W. Laumeister, secretary of the Porterville chamber of commerce:

Dear Sir:

"I noticed a recent article in your paper in which you make mention of marketing conditions in the east. This subject is being discussed very much lately not only in farming publications but by all the leading national conventions held this year. But what have they done? Nothing. All they did was to talk over the subject but never put any of their views into action. The fault lies in three different channels, namely—poor marketing conditions, lack of organization among the farmers and producers, and non-support from the different chambers of commerce in the districts affected. Recently at a meeting held by the commercial secretaries of the state at San Francisco, the members present brought up this subject but up to the present time nothing has been done by them."

"In order to get prompt action on this all-important subject, I would suggest that the different chambers of commerce call a meeting of all the growers in their districts and try and have something done for the growers."

ABOUT MORNING-GLORY

Written for the California Cultivator
By Sacramento Valley Contributor

"What are you going to do with those patches of morning-glory?"

"Nothing."

"Aren't you afraid they will be of great injury to the young trees?"

"No, when the trees get big enough to shade the ground the morning glory will disappear."

This is a part of a conversation that took place in a Sacramento Valley orchard recently and the owner was not worrying about the morning-glory because in a nearby orchard the trees had lessened the activity of the weed as the tops of the trees increased in size.

This is on rich river front land that is irrigated only during dry years. This year, for instance, it has required no irrigation for the maximum development of crops.

There are other orchards where morning-glory is worrying the owners and they are spending considerable money to keep it in check.

Morning-glory is getting to be a very serious pest in many sections of California. It seems as though the floods of last winter spread it into many fields where it had not been known. And it is such a greedy feeder and apparently so fond of warm weather that there are few crops than can compete successfully with it.

Because of its underground stems in which nutriment is stored up and from every joint of which the plant will propagate, it is one of the worst weed pests in the whole list to combat, and ordinary cultivation is a good stimulant to increased growth.

There are a number of stock recipes for eradicating morning glory. One of these is to cover it with salt. This is too expensive to use on large areas and injures the soil. Another is to cover the patches deeply with straw so as to smother the plant. Few have straw enough to cover any considerable area, and there are reports to the effect that the underground stems will live until the straw rots enough so the plants will come through it. This could be remedied by putting on more straw, probably, but this is a method that would be out of the question on big fields that are badly infested. Clean cultivation is recommended, and if kept at persistently for one or more years will undoubtedly do the work, but the cost of cultivation and the loss of the use of the land makes this very expensive if it is done to any great extent.

The Bigler-Paul-Furlong Agricultural Laboratories is developing a product that will undoubtedly kill the weed.

Rice is being grown on some lands that have had to be abandoned because the morning-glory made grain raising unprofitable. The water necessary to grow rice will kill the morning-glory. Where rice is grown on land of this character rice can be grown profitably for one or two years, the morning glory will be killed out, then grain may be planted as a rotating crop with the rice—to the benefit of both crops. And if the grain needs more moisture than is provided by the rainfall the pumps are available for irrigating.

Morning-glory is also successfully controlled where it is possible to grow irrigated alfalfa, particularly on land that produces a rank growth of alfalfa.

Where hogs can be pastured on it for a considerable period and where they can be put on a very light ration

that will make them root deeply in the ground for the morning-glory roots, the pest can be eradicated.

There are many large areas where rice and irrigated alfalfa cannot be grown easily and where hogs cannot be pastured where this morning-glory pest invites the activities of scientists or scholars who can show how to cheaply and easily do away with it.

SQUELCHING SQUIRRELS

Mr. Harry P. Stabler, horticultural commissioner of Sutter County, has been made inspector with power to enforce the provisions of the state law requiring extermination of squirrels. Mr. Stabler serves notice upon all property owners of the county in effect that all land owners and persons in charge of land are urged to wage warfare against squirrels as the state law will be strictly enforced.

The squirrel pest is costing producers of this state many thousands of dollars. It is time supervisors of other counties take the action which those of Sutter County have.

RIVERSIDE FAIR

Secretary O. P. Sanders is mailing premium list and rules for the third annual fair of the Riverside District Fair Association to be held at Riverside October 5-9. Every producer of

Riverside or nearby counties should write Secretary Sanders for this premium list.

TEPARIES MAKE A RECORD AT ANAHEIM

Following is the record of tepary beans: Planted May 1 in rows three feet four inches apart. Cultivated and irrigated as needed. Pulled vines August 16. Threshed August 21. Yield at the rate of 1750 pounds per acre.

The beans were drilled in the rows about six to eight inches apart.—J. B. Neff.

An agricultural bank law proposed for Argentina provides for 25-year leases on government lands on small rental payments and loans to individuals and agricultural associations at low rates of interest.

Mathews Reversible Twin Disc Plow

THIS is the only reversible disc plow which does not use segments to fix the position of the disc, and is therefore the only one which will always plow the same width of furrow both ways on level land and hillsides—and stick to the work on hillsides.

It leaves no water furrows. Discs are fixed in exactly the same working position every time the plow is lowered. Two discs wear twice as long as one—but cost you no more.

We are general agents for a complete line of Disc plows. Glad to tell you about them at any time.

The Lawn and

Flower Garden

ROCK GARDENS

Written for California Cultivator
By Earnest Branton

VERY year about this time I have a strong desire to build rock gardens. One who visits rocky canyons and notes the fine array of native plants on banks almost without soil cannot fail to be impressed with the possibilities of this phase of gardening.

Boulders have never appealed to me as being good material for rockeries though I have built many tons of them into such structures; the largest of six rockeries at Singleton Court in Los Angeles contained over five tons of such material and over 3500 plants, all of which were placed and planted by my own hands. Others built of broken granite, sandstone, etc., always appealed to me as being more artistic because more natural. One seldom finds a good natural rock garden among boulders for the latter form the floor of washes and canyon bottoms annually storm-swept.

Broken stone makes by far a better rock garden and every one of these should lie naturally, the largest area on the soil. Never stand a rock on edge in a rock garden. If you are merely making a rock border such use is permissible, but even here other material should be used. The same holds true in the use of boulders; never stand them on end or on edge, but let them lie as they would if carelessly thrown down and then sink each one into the soil to the point of its greatest diameter. In this way it will appear as though permanently imbedded, for the large circumference will appear at the soil level, lessening in size from base to top. Could any disposal be more natural?

I was called for consultation to the C. C. Foster ranch in Altadena, where someone had built boulder borders for paths and roads that irritated Mr. Foster, who said they looked like rows of gigantic horse's teeth. I went along the paths and with a gentle push of the foot tipped over stones weighing nearly a hundred pounds that had been stood on end. Taking one that was nearly egg shaped, I buried it as it would lie naturally, just one-half of it underground. At once it looked as though it might have so reposed for a century, and the owner was delighted. This, then, is the secret of handling boulders, if indeed there can be any secret where common sense dictates.

For plants in rock gardens we have an almost endless variety. It is not necessary to use cactus, so-called century plants (not one of which lives for more than a quarter-century), and others of this ilk, though they are not inappropriate among rocks of any sort. But we have so many sedums, stone-crops, echevarias or "hen and chickens" and other flowering and foliage plants that we do not need to use the larger sorts in small rockeries. In shaded, half-shaded, or even sunny locations one may use some ferns, for many will endure full sun. Our native brake, *Pteris aquilina*, may be seen at many points in Los Angeles on the south side of the houses, the hottest place in the premises. Not California

alone, but Australia, Africa, our South-western states, and Mexico supply such an abundance of rockery plants that we may have fine rock gardens everywhere.

Plant Bulbs Now

In some parts and by some people October is called the bulb month though it is but the first of several in which bulbs may be planted and if but one planting is to be made, November is a better month for this work. But bulbs may be planted now, dug if remaining dormant in the soil during summer, transplanted, or even dug and held for two or three months in-so-far as the general handling of bulbs is concerned. Soil cannot be worked too deeply or pulverized too finely or fertilized too heavily with rotted manure if ideal conditions for bulb-growing are to be made and such work will be amply rewarded by a superior crop of bloom.

Watering The Lawn

In last week's issue, on page 296, the editor used an article on this subject that will apply to lawns everywhere. Many, many times in these columns have I warned our readers not to sprinkle lawns every day nor to sprinkle them at all except sprinkling is continued until it becomes a real soaking. My own lawn, which is not beautiful as it is maintained merely as a playground for children, is watered but once a week. However, the sprinkler is set in one place and kept there until the water stands on the surface. As the surface becomes dry the roots grow down to moister soil and thus is a resourceful lawn made, one that will not suffer when watered but once a week.

Plant More Avocados

The avocado makes an ideal shade tree for the leaves are large and the foliage mass dense, the tree is umbrageous in natural growth and may be shaped to please the owner. A half-dozen trees disposed as they are on the Walker place at Hollywood make an ideal picnic grounds for young and old alike. When to this is added the value in fruit and in ornament, it would seem folly to plant shade trees that bear no fruit. Though the loquat has a double value in being both ornamental and fruitful it is not a shade tree as is the avocado, nor does it appeal to me as of equal value with the avocado on the two other points. In short, plant several avocados in the home grounds.

Globe Artichokes

Who hath considered our friend Arty Choke for a low damp place where a large, rough, yet ornamental plant will qualify? Is it not as ornamental as the quarter-century plant so much used? The latter toils not, yet if one gets within its toils he has a most disagreeable experience; neither does it spin anything that a well balanced individual should use. To be sure, the Mexicans make a vile drink from it known as pulque, but they lose their balance soon after using it. But the globe artichoke spins its food material into edible cocoon-like buds that are as "smooth as silk" to him that is hungered and, as stated,

the plant is also quite ornamental.

Care For Roses

Now is the time to begin work on the rose beds, for autumn flower wood is in the making and all bushes will soon bristle with new growth and buds are in evidence even now in many gardens. Do not heavily prune roses in this condition for it is harvest time. Prune out all weakly wood, branches that cross, congested centers, and shape bushes slightly—not too much. Depend upon your pruning later, in spring, after the first sprout of blooming is past. Manure heavily, spade into soil, rake smoothly and if possible cover with a heavy mulch of strawy manure. Watering on top of the later will keep a clean carpet to walk on while picking flowers, also feed plants and keep weeds from starting.

Plant Wild Flowers

In neglected gardens that receive an occasional watering a new crop of California poppies is springing up and some are already in bloom. This suggests that wild flowers in natural haunts will thrust up their tops just as soon as they receive the encouragement of the earliest rainfall. It also suggests that we should prepare a bed for a wild flower garden at once. Wet the soil, destroy the weed crop with a hoe; do it over again, then spade up the soil, smooth it down well, start that last crop of weeds and after their destruction sow a generous mixture of California native wild-flowers and reap a rich reward in blooms, many of which will be new to you, as they are native to other parts of the state.

The Moreas

In addition to Morea iridivides, which I have often recommended as one of the finest members of the iris family, there is another species in local collections that is equally beautiful. Morea iridivides closely resembles some of the true iris and is white in color with markings of brown and yellow. The other species is a deep golden yellow with circular spot of real black near the base of each petal, forming a striking yet beautiful contrast of colors. Both species require the same general treatment as iris, which is but ordinary care usually given general collections of garden plants.

Farm Bureaus

FARM bureaus are increasing in popularity and many of the centers are uniting more effectively with the county agents. In Madera County the Mountain Farm Bureau Fair was held as announced.

This month's calling dates are as follows:

Madera County, Thos. C. Mayhew, Agent, Madera.

Chowchilla, October 4.
Alpha, October 8.
Dixieland, October 12.
Fairmead, October 15.
Raymond, October 22.
Nipinnawassie, October 23.
Oakhurst, October 25.
Coarse Gold, October 26.
North Fork, October 28.

San Diego County, H. A. Weinland, Agent, San Diego.

Bonsall, October 1—Meeting, school-house, 8:00 P. M.

San Diego, October 2—Directors' meeting, 11:00 A. M.

Encinitas and vicinity, October 4 and 5—Meeting Encinitas, October 4.

Fallbrook, October 6.
Juliah and vicinity, October 7 and 8—Meeting Julian, October 8.

San Diego, October 9—Office day.

Dehesa and vicinity, October 11 and 12—Meeting, Dehesa, October 11, 8:00 P. M.

Ramona and vicinity, October 13 and 14—Meeting Ramona, October 13.

Jamacha, October 15—Meeting Jamacha, 8:00 P. M.

San Diego, October 16—Office day.

Spring Valley and vicinity, October 18 and 19—Meeting Spring Valley, October 18, 8:00 P. M.

Poway and vicinity, October 20 and 21—Meeting Poway, Wednesday, October 20, 8:00 P. M.

Mission Valley, October 22—Meeting Mission Valley school house, 8:00 P. M.

San Diego, October 23—Office day.

El Cajon and vicinity, October 25 and 26—Meeting El Cajon, October 25, 8:00 P. M.

Otay and vicinity, October 27 and 28—Meeting Otay, October 27, 8:00 P. M.

Campo and Boulevard trip, October 29—Meetings indefinite.

San Joaquin County, Frank F. Lyons, Agent, Stockton.

The San Joaquin County farm bureau will hold its annual meeting and election on October 30 at the court house, Stockton. We hope to have Professor G. H. True and Professor Elwood Mead speak on dairying and rural credits. There will be no feed or fair at this time, as the farm bureau is participating in the South San Joaquin Community Fair to be held at Manteca on the 8th and 9th of October.

Acampo, Friday, October 1—J. H. Clancy, director.

Directors' meeting, Stockton, Saturday, October 2.

Thornton, Monday, October 4—G. L. Barber, director.

Lodi, Tuesday, October 5—Geo. Ashley, director.

Farmington, Wednesday, October 6. Community Fair, Manteca, Friday and Saturday, October 8 and 9.

Lockeford, Monday, October 11—N. H. Locke, director.

Linden, Wednesday, October 13—E. L. Davis, director.

Manteca, Friday, October 15—Ed. Powers, director.

Escalon, Monday, October 18—E. A. Clough, director.

Ripon, Thursday, October 21—J. P. Watkins, director.

Tracy, Monday, October 25—H. A. Frerichs, director.

Waterloo, Wednesday, October 27—R. J. Benjamin, director.

Holt, Friday, October 29—J. A. Aggeler, director.

Directors' meeting, San Joaquin County Dairymen's Association and annual farm bureau meeting and election.

Kern County, Roland R. Mack, Agent, Bakersfield.

Wasco, October 4, 8 P. M.—W. T. Fowler, director.

Delano, October 6, 8 P. M.—R. H. Hiett, director.

McFarland, October 8, 8 P. M.—P. M. Peterson, director.

Rio Bravo, October 9, 8 P. M.—T. N. Martin, director.

Panama, October 11, 8 P. M.—A. B. Robinson, director.

Rosedale, October 13, 8 P. M.—John Waters, director.

Tehachapi, October 19, 8 P. M.—L. T. Jenkins, director.

Muroc, October 20, 8 P. M.—C. E. Clark, director.

Willow Springs, October 21, 8 P. M.—C. S. Millarr, director.

Arvin, October 22, 8 P. M.—R. Haven, director.

Bakersfield, October 23, 8 P. M.—M. J. Adams, director.

Shafter, October 27, 8 P. M.—E. U. Combs, director.

Napa County, H. J. Baade, Agent, Napa.

Salvador, October 2.

Browns Valley, October 6.

Coombsville, October 7.

Wooden Valley, October 8.

Soda Canon, October 9.

Napa, October 9—Directors' meeting.

Carneros, October 11.

Fly, October 13.

Calistoga, October 14.

Soscol, October 16.

Rutherford, October 18.

St. Helena, October 20.

Pope Valley, October 22.

Mt. George, October 23.

Berryessa, October 27.

The subject of "Acid Soils" will be discussed at these meetings.

Ventura County, Wm. B. Parker, Agent, Ventura.

Fillmore, October 4—W. H. Fleet, director.

Ventura Avenue, October 8—Henry H. Neel, director.

Nordhoff, October 11—Guy T. Stetson, director.

Oxnard, October 13—Thomas A. Rice, director.

Camarillo, October 15—E. W. Daily, director.

Bardsdale, October 18—Thomas Wileman, director.

Saticoy, October 20—J. N. Procter, director.

Moorpark, October 21—Aratus Everett, director.

Somis, October 25—F. A. Snyder, director.

Mound, October 26—E. W. Gerry, director.

Simi-Santa Susanna, October 27—R. E. Harrington, director.

Santa Paula, to be arranged—L. E. Mills, director.

Solano County, J. W. Mills, Agent, Fairfield.

Rio Vista, October 5.

Vallejo, October 7.

Suisun, October 12.

Cordelia, October 14.

Vacaville, October 19.

Dixon, October 21.

Glenn County, W. H. Heilemann, Agent, Willows.

Bayliss, Friday, October 1.

Ord, Tuesday, October 5.

Larkin, Friday, October 8.

Codoro, Tuesday, October 12.

Jacinto, Friday, October 15.

Orland, Tuesday, October 19.

Regular meeting of the board of directors will be at the farm adviser's office October 2, 10 a. m. Annual meeting for election of officers Willows, October 9.

Strength

A distinctive feature of the Yuba Ball Tread Tractor is the tread. It is of manganese steel—strong, durable, and highly resistant to abrasive wear.

The Yuba Ball Tread Tractor is built throughout to withstand more than ordinary wear and tear. It is able to resist the hardest kind of punishment, because expensive steels and skilled workmanship are used in the construction of it.

This drawing is made from a photograph, showing an upper tumbler casting (used on Yuba gold dredges) suspended by a Ball Tread Tractor chain.

The Phone for My Home

WITH a Kellogg Telephone in your home, you are ahead of trouble and losses that come when sudden illnesses develop or long trips are taken to town only to find the markets gone to pieces.

The man with the good telephone in the house is in quick touch with the voice of the entire world. In a minute he knows the markets. In case of fire, tramps or illness, he can call the whole community. If he has an orchard and the fruit ripens quickly, he can scour the country for help in harvesting. The whole community becomes a living thing to him and that old dread of country life—isolation—is gone forever.

Kellogg Telephones End Telephone Troubles

They are made in the largest independent telephone factory in the world, and have to undergo the most rigid inspection for quality ever devised. 37 distinct tests given every instrument before it is O. K.'d for shipment.

You may find that Kellogg instruments cost slightly more than ordinary ones. But a huge trade has been built on them all over the world because they do away with repair bills and because after years of service the voice is transmitted as clearly and plainly as when they are new. Just the other day a customer wrote us that he had a Kellogg phone in service fifteen years.

The instrument shown here is Kellogg Favorite. Less wall space, stronger ring, reliable lightning arrester. Standard, unbreakable receiver and mouthpiece, secret service push button to ring "Central" without calling neighbors.

Send in your name and address and we will put you on our telephone bulletin list. Let our expert department help you in your telephone troubles. Get free the kind of information that will save you money. Write for Bulletin 24.

(Continued from Page 315)

bled his returns. The producer used to get 20 cents out of every dollar; today he is getting 40.

"Successful cooperative efforts are based on the fundamental principle of having the coin behind them, not good faith. It is sometimes suggested to me that it is not necessary to sign contracts; all we need is a 'gentlemen's agreement.' The only answer I make is that I am afraid I might forget to be a gentleman."

CHEAPER MONEY

Address by Myron T. Herrick

(Concluded from last issue)

AFTER the needed revision of the state laws had been made, the next step should be the enactment of laws for bond-issuing institutions.

Such institutions are especially necessary for long-term mortgaging, because the money is invested for so many years and comes back so gradually that such business is not practicable for private individuals; it is not practicable either for small or ordinary sized banks or companies that have only their own capital stock or deposits to lend, since the length of the investment and the slowness of its recovery would eventually immobilize their assets and reduce them to inactivity. The business is rarely attempted except by institutions that are able to reach the money of the investing public through the issue and sale of bonds or debentures. The bond-issuing institutions are of three kinds: (1) state-aided banks, or government bureaus or commissions; (2) private bond-and-mortgage companies; (3) landschafts.

Which of these should the United States adopt? The first in Europe are founded, not for ordinary farmers, but usually for ignorant and indigent peasants, or for carrying out some political policy. They operate with public funds or on government guaranty. The mortgages they acquire are only incidentally the security for their credit instruments. Consequently, their establishment would only confuse the problem of the reorganization of land credit. We are striving in the United States to put land credit on its true and proper base—to enable the land itself to be the course and the security of the money borrowed upon or for it. This cannot be accomplished through state aid; it rests upon the effective mobilization of land values. Let us look this question squarely in the face. If government is going to find the money for farmers, what is the use of bothering about improving land credit? Both borrowers and investors would expect government to stand good for all losses. But if the reorganization is to rest—as it should—upon the land itself, then the enactment of proper legislation becomes absolutely indispensable for creating the necessary powers and safeguards, especially for bond-issuing institutions; aside from state-aided concerns, the only two kinds are private bond-and-mortgage companies and semi-public landschafts.

The companies have capital stock; this invariably is large and necessarily so, in order to give a financial strength and standing that will assure an adequate flow of money and cheapness of operation. The disregard of this vital point is a shortcoming of the recent laws of Indiana, Wisconsin and Utah which allow the formation of companies so small that they will

be utterly unable to inspire public confidence or command an active market for their bonds. Agriculture should have institutions of a size commensurate with its needs. I am inclined to believe that the legislators, who hesitate to permit the assembling of the enormous capital that American farmers require, are actuated more by political considerations than by reason. Perhaps they are imbued with that false sentiment which prompted the Chinese to oppose railroads for fear lest the innovation would disturb the repose of their dead ancestors. Small bond-issuing companies should not be allowed, because they would open the field to irresponsible promoters and possibly lead to serious consequences, since they might flood the country with worthless stocks and bonds and bring on a crash exactly as happened to the old farm-mortgage business in 1893.

If the laws contained the proper regulations and restrictions, large companies could not possibly occasion any alarm. So I believe that the laws for bond-and-mortgage companies (or land-credit banks, as some people call them) should require capital stock of an amount sufficient to establish their financial standing. Particularly ought this to be so with any federal legislation that might be enacted. At the same time the states ought to pass laws for landschafts, so that the farmers could join institutions of their own, should they become dissatisfied with the facilities afforded by the companies. The existence of these two kinds of concerns, operating side by side, would give rise to a healthy competition that would forever prevent oppression and keep the money market continually open for rural landowners.

Not one state has yet thought to have a law on landschafts. These institutions, however, are the original organizers of land credit, and they remain the best for according long-term credit on farm land. A landschaft is a subdivision of a state, with executive officers appointed by the governor upon nomination of resident landowners enrolled as members. Nobody joins except applicants for loans, and membership ceases upon payment of the loan. Its powers are to issue debentures in exchange for annuity contracts secured by mortgages on the farms of members. The debentures are the joint and several obligations of all the members—and thus individual is replaced by collective credit, and all the mortgages are amassed to secure each and every debenture. This is the safest, soundest, and most easily negotiated security ever devised for land credit. As a result members of a landschaft get loans on better terms than do borrowers from any other kind of lending concern.

A landschaft has no capital stock, and it distributes no profits. All its earnings go to pay its expenses and to reduce the cost of business for the mortgagors. Different from a company, a landschaft does not sell its debentures; it swaps them for the mortgage contract of the borrower and lets him find a buyer. The proceeds go directly to the borrower. Consequently, a landschaft deals in credit and not in cash, and it never has any fund on hand except from the repayments of borrowers; and this must be paid out again every six months in redeeming debentures. Moreover, if the laws are properly drawn, a landschaft is not required to redeem debentures any faster than the borrow-

ers repay their loans. This is its only liability—to pay over to the bondholders what it receives from the borrowers; and so it is protected by the very same safeguard prevailing in true building-and-loan associations, which is that it cannot contract heavy obligations to outside parties. The reorganization of land credit in the United States would be incomplete without landshaffs. With them, an adequate flow of money would always be assured to landowners.

The subject of land credit has been given the greater attention; nevertheless, without any intention to depreciate this, I will say that cooperative banking is by far the more important feature in this movement. Rural cooperative banking is badly misunderstood. The widespread misconceptions about it have belittled and impeded the movement. Many (perhaps the majority) think that the sole function of a cooperative bank is to collect members' savings to lend to members; that is, to make small loans to members out of their own money. This limitation may be all right for an urban cooperative bank, but it is all wrong for a rural co-operative bank, because farmers, as a rule, have no money to lend to one another; and this fact cannot be changed through co-operation.

This error has been written in the laws for the so-called credit unions of New York, North Carolina, Wisconsin, Texas, Utah and Oregon. These are copies of a similar law in Massachusetts which the framer, Mr. Pierre Jay, agent of the New York Federal Reserve Bank, admits was enacted for the poorer class of city dwellers. The error has made these laws useless for agriculture, and they will have to be recast. In 1914, by authorizing these little thrift societies to issue bonds and grant forty-year loans, Massachusetts made her law a very dangerous piece of legislation. The defects in all these laws are so serious that the public should be warned against organizing or patronizing these misnamed credit unions until safety is assured by the necessary amendments. The credit-union laws are a conspicuous instance of good intentions gone wrong through immature thought and hasty action.

The cause of much of the misunderstanding about cooperative banking and credit is the mistaken notion that cooperation is an altruistic or benevolent means of helping the down-and-out class or persons who are individually weak and incompetent. This half-truth is alive with dangers. Co-operation can never help anybody except him who is able and willing to help himself—and his neighbor also. True, cooperation is the quickest way to success for the humble as well as for the high, but its literal interpretation is organized mutual self-help. It presumes that men will work harder, longer and better together than when standing alone; it requires a spirit and an ability to both give and receive; and it can reach its fullest development only among persons who are capable and honest, and known to be so—among persons who ask no favors, who spurn charity and state aid, and rely solely upon their own talents, toil and resources.

There is more cooperation in the United States than in any other country, and it is used here even for the largest undertakings. The gathering and distribution of news by the Associated Press is the most striking example in the world of cooperation conducted on a grand scale without

lucrative object. The life-insurance companies, with their millions of policy-holders and billions of dollars of assets, and the mutual savings banks and building-and-loan associations, with their stupendous totals of deposits, savings and reserves, put most of the funds of organized thrift under cooperative management, while trade unionism (the oldest kind of cooperation) permeates the laboring classes. These are city-centered, but do not constitute all the cooperative activities. Cooperation appears in inconceivably varied and innumerable enterprises. The protection of the levees from breaks is in some of the states bordering the Mississippi river a cooperative work. Farmers' organizations for safeguarding mutual interests are numerous, while rural co-operation for business has already made substantial progress, but chiefly for marketing fruits and the manu-

facture and disposal of milk products.

If American farmers should awake to the full realization of its possibilities, they would soon be using cooperation in all their industrial, commercial and financial affairs relating to agriculture. With the splendid examples in the city before them, it is strange that they have lain dormant so long. Cooperation may, of course, be practiced through a corporation or in a partnership, but the association is its best breeding ground and nursery. In the United States, however, the purposes for which an association may be organized are limited. Business and ordinary banking have been content with the corporation and partnership. The propagandists should broaden their views and strive to make lawful for associations whatever may now be done through these other two forms of organization. Furthermore, if they wish to see rural co-

operation reach its highest development, they should advocate such a modification of the anti-trust laws as would permit cooperative associations to combine.

Combination of associations is absolutely indispensable for rural co-operation. The creation of detached and isolated associations would leave the work incompletely done. There should be systems of inter-related associations; and I hope to see the day when agriculture in the United States shall be organized by local, regional, state and departmental groups bound together by unions and federations into great national systems for strengthening the purchasing and selling power of the farmers and mobilizing their resources for their financial needs. Organized in this cooperative way, the farmers would have first use of their wealth for financing themselves; their forty-five billion

—Just glance over this ad, and see how much we can actually save you on the few items mentioned. Remember our great big catalog is just brim full of such offerings. By all means send for it today. —Many of the things we offer here are not in our present catalog, as we cannot mention there the "special" purchases that we make during the season. So for the things advertised here—just sit right down and send in your order. It will be filled and shipped the same day. —Remember we pack all orders, except lumber, and put them on the cars, FREE.

Why Not Fix Up Your Roof Before the Rains Come?

—Right now, while the roof is dry from the summer, is the time to get it ready for winter. Note our prices and see what we can save you on new roofing, paint, etc.

Black Roof Paint, 45c and 60c

—Specially made under our direction for use on paper, felt and all flat or nearly flat roofing. Will make an old roof shed water like new. This price by the gal. in 5 gal. lots.

\$1.25 Black Graphite Roof Paint, 50c

—Nothing better for a shingle roof, fills up the cracks and pores. This price per gal., in 5 gal. lots. We've sold thousands of gallons of this paint and have yet to hear of it's not giving satisfaction.

\$1.25 Barn, Roof, or Fence Paint, 85c

—A specially prepared paint, made from a formula that has the benefit of 15 years' experience with the climate of the southwest. —May be had in either Green, Red or Gray, in 5 gal. lots at 85c per gal.

Shingle Stain, 50c

—Our own "Standard" brand, made from pure ground colors, all desired shades. Will hold its color longer than many of the higher priced stains.

House and Floor Paints, \$1.50

—This one item will prove to you that we do sell paints cheaper than any dealer in the West. Our tremendous volume of business makes this possible. All colors.

\$1.50 Air-Tight Stoves, 98c

—Made of best quality sheet steel, uniform color, flat top, heavy inside lining, steel draft, with nickel steel screw damper disc. Heavy steel legs and pipe collar to fit 5-in. stove pipe.

Galvanized Barbed Wire, \$2

—This is a special 2-point light Star, weighing 50 pounds to spool of 80 rods. Our price per spool..... \$2.00

Heavy Glidded Barb Wire, \$2.55

—2-point galvanized barb wire, weighing about 73 pounds per spool of 80 rods. Our price..... \$2.55

Shovels at Wholesale Cost

—Now, today, is the time for you to do as hundreds have already done, and order a year's supply of these shovels.

—All kinds and sizes, all in perfect working condition but have been slightly smoked in a fire.

Long Handle, Round Point Shovels, per dozen..... \$4.85 or 50c each

Long Handle, Square Point Shovels, per dozen..... \$4.85 or 50c each

D Handle, Round Point Shovels, per dozen..... \$4.15 or 50c each

Long Handle Spades, per dozen..... \$3.75 or 40c each

Long Handle Scoops, per dozen..... \$3.75 or 40c each

D Handle Scoops, per dozen..... \$3.50 or 40c each

\$30 WALL BOARD, \$17.50

—Per 1000 sq. ft.—the finest quality—Cream white fiber board, the kind you usually pay \$30 a 1000 square feet for. It's all in A-1 condition, but we're overstocked on the 4 and 5-foot lengths, 48 inches wide, and to reduce the amount on hand are cutting the price to \$17.50 a thousand. Get your orders in early on this item.

\$15 to \$18 Front Doors \$10 Veneered Oak With Plate Glass Panel

—These are the doors that we secured specially some time ago, so they're not in the catalog. —All standard sizes and styles. Finest quality oak veneer with plate glass panels at top.

\$1.75 Glass Door \$1.25

—Finely made doors with two lights of glass in upper half each glass has circle top and measures about 10 x 40 inches. —Doors are of finest sugar pine and positively number one grade in every way.

Screen Doors 25% Off

—New screen doors, the overstock of a famous door factory, made of best selected sugar pine in standard stock sizes. These doors can be duplicated in any first class yard at 25% to 40% more.

Style No. 8, \$1.25 —Usually sells for \$1.65. Made of clear sugar pine, fitted with black screen \$1.25 wire at our price.....

Style No. 9, \$1.40 —Sugar pine, with three lower panels and fitted with galvanized screen wire. A door that will stand lots of use; our price..... \$1.40

"Standard" Roofing Paper

—A splendid quality of roofing that most firms would sell 20 to 40 per cent higher. Each roll complete with necessary cement, nails, etc., ready to lay. Send for FREE sample.

1-ply, double-sanded, per roll of 108 square feet..... \$1.15

2-ply, double-sanded, per roll of 108 square feet..... \$1.40

3-ply, double-sanded, per roll of 108 square feet..... \$1.65

1-ply, "King" smooth, per roll of 108 square feet..... \$1.25

2-ply, "King" smooth, per roll of 108 square feet..... \$1.50

3-ply, "King" smooth, per roll of 108 square feet..... \$1.75

This Special Steel Enamelled Bath Tub \$8

—One of the greatest bargains we ever offered! Made of best galvanized 24 gauge steel. Outside is finished in a rich sky blue enamel with bronze trimmings and hardwood edge. Price only \$8. —Other larger sizes at \$8.50, \$9 and \$10.

Low Down Enamel Steel Toilet Combination..... \$11.50

Complete to floor—wonderful value Low Down Vitreous China Toilet Combination..... \$15.50

Special value—Closet \$22.50. Big value in High Tank \$10.00

Toilet Combinations..... Complete to floor—a bargain. Special Bankrupt Stock of Kitchen Sinks.....

All sizes—up from..... \$1.00

Best Quality Porcelain Lavatories; every one guaranteed..... \$3.75

\$10 down to.....

geles, California, as Second-Class Matter.**Thursday, Sept. 30, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**INTENSIVE FARMING**They used to have a farming rule
Of 40 acres and a mule.
Results were won by later men
With 40 square feet and a hen.
And nowadays success we see
With 40 inches and a bee.And when the 40 inches and the bee
are used to support a family of young-
sters with healthy appetites it is rea-
sonably sure that the "farmer" will
be stung.We believe in intensive farming.
We all know the American farmer is
lax in utilizing all his possibilities,
and this small farming effort may re-
sult in educating to more use of the
forces at hand. But let us be reason-
able.**NITRATE OF SODA**Chile now exports in the neigh-
borhood of two and a half million tons
of Chilean saltpetre, or nitrate of soda,
on which it collects an export duty of
ten dollars. In fact, this one export
which she exports practically sup-
ports her government. It is an in-
teresting fact that the first shipment
out of that country of what was then
known only as Chilean saltpetre was
made in a sailing vessel coming around
the Horn which landed at various
Atlantic ports of this country. The
captain of the vessel was unable to dis-
pose of the few tons of saltpetre he
carried and finally was compelled to
dump it overboard. Today we are pay-
ing two and a half and three cents
per pound and asking what we will do
for nitrogen when Chile's great supply
is exhausted.**LEMONADE**We recently inquired at a soda
fountain as to how many sodas of a
certain flavor extensively advertised
were sold to one lemonade, and the
first answer was, "99." The proprietor
immediately withdrew this, however,and said, "No, it would be nearer
200" and this an attendant corrected
by saying it would be nearer 300. The
only reason given for this preference
was that the drink was so extensively
advertised.This particular drink may be harm-
less though at one time there was talk
of regulating its sale by those who had
to do with the enforcing of the food
and drugs act and we can see no rea-
son why the demand for it should be
so great.We recall well the time when a cold
and pure lemonade was considered the
most healthful and most attractive
drink offered for sale. Unfortunately
it takes time to make good lemonade.
The lemon flavored soda water drink
is a mixture of syrup, often of chemi-
cally made "lemon" flavor, into which
is drawn the carbonated water. Why
pure lemon juice and syrup cannot be
used in place of this concoction we
fail to see other than that the soda
water men claim it takes more time
to prepare, especially does it take
more time to make from fresh lemons
a glass of lemonade, but if the people
could be educated to demand it the
soft drink dispensers would soon learn
to make it.The soda fountain where this infor-
mation was secured daily serves thou-
sands of patrons, but the proprietor
told us that the demand for lemon
drinks called for less than one dozen
lemons per day. It is time for Califor-
nians to inform the people as to the
healthfulness of this neglected drink.**RURAL CREDITS**We have given practically entire
the address of Myron T. Herrick at
the Rural Credits session of the Inter-
national Irrigation Congress. We do
not agree fully with Mr. Herrick, but
he is a keen observer, has made long
study of credits and his words are well
worth considering. He takes the
ground, however, that the state must
keep its hands entirely off of any ar-
rangement whereby the farmer is to
be financed. He says truly that there
is much misunderstanding about co-
operative banking and credit in the
mistaken notion that cooperation is
"an altruistic or benevolent means of
elevating the down and out class." We
believe with him fully in this and
if the movement which aims to do jus-
tice to the farmers takes on a color of
paternalism or philanthropy it must
necessarily fail. The farmer is not
asking favors, simply justice; nation
and state may join in aiding the farm-
er to secure funds with which to
finance the agricultural operations of
the country. It is probable that no
one is at fault that there has been
discrimination in the past but certain
it is large manufacturing and commer-
cial operations have been boosted
with a much lower overhead expense
than have agricultural operations. The
present rural credit movement
will answer that question and we be-
lieve the remarks of Mr. Mead, as
quoted by our contributor on leader
page of this issue, point more cor-
rectly to a solution than do the re-
marks of Mr. Herrick. Perhaps Amer-
ica can do better than has Australia
or New Zealand, or even Germany or
other European sections, where for a
long time there has been opportunity
to secure amortized loans. Certainly
state aid has proven a wonderful
blessing to Australia.**OLIVE GROWERS' PROBLEM**Orchardists and gardeners and
producers of almost every farm crop
are confronted with a serious problem.Many of them, in fact, with the wear-
ing out of the land and its consequent
renewal, and many other cultural prob-
lems, are kept busy with the cultural
side of farming, but once they have,
to a degree at least, mastered those
problems, a still greater one looms be-
fore them—a market. The California
olive grower has grown the finest
product of its kind in the world, at
least to the taste of most of us on the
Pacific Coast. It is a food and not a
relish, and one of the most nutritious
of foods, but for some reason the peo-
ple of the world do not appreciate this
fact as they should and as we know
they will. Now, how may these people
be educated so as to take this food
which we produce to the extent of a
million and a half of gallons annually;
also another food, olive oil, of which
we produce approximately a million
and a half of gallons, not taking into
consideration the vastly increased pro-
duction when the remainder of the 28,-
000 acres now planted in olives comes
into bearing? The demand has been
created to a degree for these products
when imported, for we annually im-
port about 6,000,000 gallons. Califor-
nia olive products have won medals
and honors at all expositions over the
European product. Why then this lack
of appreciation on the part of the
American consumer? In view of the
fact of the present production in ex-
cess of demand for the California
product olive growers in the Northern
part of the state have started a cam-
paign to organize for marketing pur-
poses. Unfortunately, there was an
impression that the movement looked
toward creating a great demand for
California olive products through ad-
vertising only, and as the membership
was limited to producers many of them
felt that this meant the creating of
a demand for California olives of all
brands, whether good, bad or indiffer-
ent, and that the packer must first
secure the benefit and dispose of his
stock before he would come back and
purchase of the grower.We attended a meeting in Los An-
geles last Saturday at which the aims
of the new association were stated and
we noted that this same impression
prevailed. The organizers assured us
that they are simply engaged in the
preliminary steps and they urge all
olive growers to unite in this prelimi-
nary movement in order to perfect a
workable marketing organization.We well recall when Mr. Chamblin
was preaching to the discouraged or-
ange grower the gospel of organiza-
tion. Cooperation at that time was
noted for its failure, and Mr. Cham-
blin's effort made slow progress, but it
finally was organized on the general
plan of community first, the state or
larger organization afterwards. How-
ever, the raisin growers we believe
have organized along the other line,
perfecting a great strong organization
and building up branches from it,
hence this feature of the olive grow-
ers' effort may be best, but we think
the management should make every
effort to show to the growers that the
prime object will be a standardized
product for which thousands may be
expended in advertising. But if the
advertising precludes standardization
an indifferent product under the cho-
sen brand may do more harm to the
organization than would the thousands
spent in advertising benefit it. The
olive growers must organize and we
trust they will take a hand in a move-
ment which will lead to success. To
that end every olive grower should
look into the organization which is
now on the way.**Agricultural Notes**Maple sugar is very short in Canada
this year, about one-third of a crop
being secured this spring.South America has heretofore been
supplied with potatoes by Europe.
Owing to war conditions she is now
looking to the United States for this
food.Coffee pulp is being utilized for
manure in Southern India. The pulp
is taken as it comes from the pulper,
dried and composted, and is then ready
for use.The bureau of plant industry of the
department of agriculture is distribut-
ing date palm offshoots recently im-
ported by the Date Growers Associa-
tion from the date gardens of North-
ern Africa.New Zealand grain farmers are ap-
prehensive of a scarcity of harvest
help and have asked for government
cooperation in the releasing of labor-
ers on public works during the har-
vest season. The season in that south-
ern island lasts from December to
April.The wool trade section of the Brad-
ford, England, chamber of commerce
recently held a meeting to consider
what to do with the accumulations of
wool. Storage capacity is exhausted
and the British clip is already being
delivered. It is suggested that a large
public warehouse be erected by the
municipality for storing the excess.The prohibition against the impor-
tation into Cuba of cattle, sheep, goats,
and hogs from the United States,
which was adopted because of the
prevalence of the foot-and-mouth dis-
ease in this country, has been re-
pealed, and these animals may now be
imported through the port of Habana
upon compliance with the prescribed
regulations.The report of the Kansas state
board of agriculture for the first quar-
ter of 1915 contains matter of special
interest to Californians at present in
reporting investigations as to sweet
clover, feterita and Sudan grass. We
do not know whether this report will
be sent free to Californians but those
who are particularly interested may
get in touch with J. C. Moore, secre-
tary of the board, Topeka, Kansas.The shortage of dyes which the war
has brought about in this country is
causing a scurrying around to see what
can be done within our own bounda-
ries. It is now reported that the osage
orange used for farm fences to a great
extent in the Middle West promises to
be the means of supplying natural
dyes. The dyes are made from the
"fruit" and it is said that 40,000 to
50,000 tons of "oranges" can be deliv-
ered each year.California egg producers are not the
only ones who are having trouble with
imported eggs. Notice the following
from Auckland: "The high price of
grain for chicken feed in New Zealand
has so much affected the price of poul-
try and eggs that it is found profitable
to import instead of export, as has
been the custom. This has caused the
poultry raisers to protest, for they
claim eggs are imported from Amer-
ica and other foreign countries and
sold as fresh-laid eggs. They have
asked the government to apply the
food and drug law to compel import-
ers to mark the origin of all eggs im-
ported; also, that all chilled eggs of-
fered for sale be branded as such. It
is not possible to give the imports of
poultry and eggs from the United
States since they are not listed."

Agricultural News Notes

of the Pacific Coast

Northern California

Butte County dairies are increasing the number of silos.

Sutter County rice growers report exceptionally good yields.

Geyserville, Sonoma County, reports an exceptionally fine prune crop.

Thermalito, Butte county, is discussing the formation of an irrigation district.

The burning of a winery near Forestville, Sonoma County, caused the loss of 635,000 gallons of wine.

The Hopgrowers Association of California proposes to establish permanent offices in Sacramento.

Willows, Glenn County, reports that there will be extensive planting of rice in that county next season.

The Almond Festival at Esparto called out a big attendance and has been declared a complete success.

The headquarters for the Placer County farm bureau are now in the chamber of commerce rooms at East Auburn.

Colusa County rice growers have arranged a blackbird alarm or scarecrow which is proving effective in saving the rice.

J. W. Jeffrey, representing the State Viticultural Commission, finds wine grapes selling in Napa County for \$12 to \$13 per ton.

Engineers of the state highway commission are working on a line establishing grades on the road from Auburn to Nevada City.

Ukiah, Mendocino County, people have decided that on account of the exposition it will be unwise to hold their hop festival this season.

The board of directors of the Sacramento Valley Development Association has called a conference of producers to discuss marketing problems.

Wine grape producers are feeling more encouraged at the situation, especially as the larger winery interests have decided to be more liberal in their treatment of the grower.

Warehousemen of Sutter County are planning for storing the biggest crop of beans ever produced in that section. Blackeyes have been yielding in the neighborhood of 20 sacks per acre.

Live stock men of Yuba County report that many cattle of that county are affected with a serious skin disease which has been most baffling to veterinarians who have been employed.

The Gridley, Butte County, cow-testing association has completed its first year, and finds the association has resulted in eliminating many boarder cows and in putting the dairies on a more profitable basis.

Rice growers of Yolo County have decided to join the Pacific Rice Growers' Association. The association is being organized in Butte County and hopes to build warehouses and otherwise encourage the industry.

Butte County orange growers have formulated a statement to the department of agriculture regarding the eight-to-one test. The growers feel that the present ruling is an injustice to their section and are asking Congressman Kent to present the matter.

Central California

The Kingsburg Growers' Cannery has packed nearly 60,000 cases of fruit.

The new peach growers' organization has made sales in its corporation stock to the extent of \$70,000.

The Fresno District Fair is attracting attendance from all sections of the San Joaquin Valley this week.

W. L. Whepley, a representative orchardist of Tulare County, died at his home at Lemon Cove last week.

Raisin-makers are watching the sky for indications of rain, and hoping the rain will hold off for a few weeks longer.

The Prunegrowers' Committee of the Santa Clara Valley is urging growers to stand firm for a five-cent prune.

A milk condensing company is contemplating the establishment of a condensary at Turlock, Stanislaus County.

A large herd of purebred Jerseys was sold at final dispersion sale at Hanford last week. Prices ranged from \$100 to \$200.

Peach growers at Fowler, Fresno County, recently held an enthusiastic meeting and decided to unite with the California Peach Growers' Company.

One canvasser in the Kingsburg section recently turned in subscriptions to the extent of \$7200 to the California Fruit Growers' Company.

Amongst farmers' institutes being held in Monterey County, those yet to be held are at San Lucas, September 30; Lockwood, October 1, and San Ardo, October 2.

Land owners in the proposed Lindsay-Strathmore irrigation district of Tulare County are protesting against the formation of the district. If organized along the line of suggested boundaries it will comprise about 80,000 acres.

Growers at Hanford appeal to the county sealer of weights and measures to investigate as to nine and a half pounds tare weight taken off for each box in a load of fruit. Careful weighing of a number of boxes showed them to weigh less than nine pounds.

Former State Horticultural Commissioner J. W. Jeffrey is securing information from vineyardists of Merced County for the State Viticultural Commission. The commission hopes to induce the wine manufacturers to handle the greater percentage of the second crop.

The sheriff of Fresno County is busy keeping in touch with raisin thieves who are not content with a handful but go with trucks to dry yards and take them off by the ton. Six of such thieves were captured within a week.

California is shipping about 200 cars of fresh grapes daily.

A new cattle corporation has been organized at Corcoran, Kings County, with a capital stock of \$200,000. The company is to be known as The Kings County Land and Cattle Company. It has purchased over 3000 acres of land southwest of Corcoran, which it will devote to dairying, alfalfa and hog raising.

Southern California

Imperial Valley farmers are hoping for a rise in cotton prices.

Chino, San Bernardino County, has raised \$40,000 for its new cooperative cannery.

Arrangements for the cooperative cannery at Hemet are progressing satisfactorily.

San Luis Obispo County poultry and sheep people are appealing for protection from coyotes.

The California Fruit Growers Association handled over 62½ per cent of the citrus fruit of California.

The Associated Chambers of Commerce of the San Gabriel Valley picnic in the San Gabriel Canyon on Saturday of this week.

Lompoc, Ventura County, has finished the harvesting of its mustard crop. One threshing machine had a continuous run of 53 days.

The Beaumont Fruit Growers' association packing house is busy shipping Jonathans, which are commanding from \$1.75 to \$2.00 per box.

San Bernardino County motor cops are becoming active and insisting on all vehicles, whether horse drawn or propelled by gasoline, exhibiting lights at night.

The Pomona Valley Canning Company closed its season's run with nearly 3,000,000 quarts of fruit in cans. The payroll for the cannery during the season was \$28,000.

Lima bean growers at Mound, Ventura County, are urging a more general marketing organization of lima bean producers. The crop will be much smaller than first anticipated.

Cities of Southern California which have municipal water plants are invariably pleased at results. The water plant of the city of Pasadena netted that town for the month of August \$14,331.

The United States attorney is making application for injunction against a land company filing on the waters of Pauma Creek, maintaining that such waters belong to the Indian Reservation.

The Saticoy, Ventura County, farm bureau center is working on a flood control proposition which will protect farming lands from storm waters. Farmers have been trying for years to secure protection.

Every drop of water in the Colorado River is flowing into the intake that feeds the canal system of the Imperial Valley, according to the announcement made by Receiver Holabird of the C. D. Company.

Riverside orchardists who had property near the plant of the Riverside Cement company have settled with the company on the basis of \$86 per acre because of damages sustained from dust floating over the country from the mill.

Lima bean growers of Orange County are perfecting their organization and are now better organized than those of Ventura County. However, Ventura growers are coming into line and a successful season is promised to the growers.

The Coast

Arizona receives about \$60,000 of the national forest fund.

A one day fair will be held at McNeal, Arizona, on October 9.

A land products show is scheduled for Portland, Oregon, October 25 to November 12.

British Columbia reports a pear crop at least 25 per cent larger than the record.

Dairymen of the Salt River Valley, Arizona, have organized a cow testing association.

Nearly all sections of the Northwest report potato crops from 50 to 75 per cent of normal.

Winter Banana apples are now commanding about \$2.00 per box at point of delivery in Eastern Washington.

Minidoka County, Idaho, reports fruit harvest as very light because of late spring frosts and hot dry summer.

The Eighth Annual Apple Show will be held at Spokane, Washington, this fall with \$2000 cash premiums to be offered.

Five thousand feeders have been shipped into Chandler, Arizona, and there is difficulty in securing sufficient pasturage.

One county in Utah which last year shipped 680 cars of peaches shipped this year less than 50 cars, because of late spring frosts.

The Utah State Fair is to be held at Salt Lake City for ten days beginning September 27 and running to and including October 6.

Western Washington is having trouble with the burning of a great many hop dryers. It is thought the fires are due to incendiarism.

It is reported that many Pacific Coast peaches have not been unloaded from the cars in Chicago but all delivered to the dump as garbage.

Farmers of Cochise and Santa Cruz Counties of Arizona recently met at Douglas and decided to organize a farm improvement association.

The Spokane Interstate Fair called out a record-breaking attendance this year. That of the first day, which is usually light, exceeded 10,000.

One farmer of New Mexico recently sold his farm consisting of six townships. With the ranch went 4000 head of cattle, the aggregate price being not far from half a million dollars.

The largest run of cattle to the Union Stock Yards, Portland, Ore., for several months was on Monday of last week when 1518 head were received. On the same day were received 2500 hogs and 1160 sheep.

The Water Users' Association, having lands under the Roosevelt Dam in Arizona, is discussing the matter of making the Roosevelt Road, which belongs to the association, a toll road in order to raise money for its upkeep.

Engineers of the federal reclamation service are surveying the Black Canyon lands in the Payette-Boise Valley of Idaho. There are 90,000 acres of land included in the district being surveyed. Settlers hope to have an irrigation district established by the reclamation service.

WEANING THE FARM COLT

TO KEEP the colt growing without interruption during weaning time and afterward is a most important consideration in producing horses

profitably. A good horseman aims to replace the milk that the colt has been accustomed to secure from its mother. He tries also to reduce the worrying and fretting of the colt to a minimum. To wean a colt appears to be a simple matter. It is simple as many do it; yet the very low degree of success that is shown on many farms by their unthrifty colts is evidence that there is something wrong or that there is something lacking. Often in a few weeks during weaning time the youngster changes from the growing, sleek, milk-fat colt to a stiff-haired and unthrifty, stunted individual. The colt if properly cared for need lose but little of his flesh, bloom and spirit.

Grain to Be Fed

Grain must be used as the milk is taken away. It is necessary that the colt have been taught to eat grain before weaning is attempted. Oats have always been preferred by horsemen for young colts. They are undoubtedly superior to any other single grain. The colt likes a mixture of a variety of grains and will thrive best on such a ration. He relishes corn and it may well be fed as part of the grain ration. It may be said that corn contains a rather high percentage of fat. True it does and so does milk which is as nearly ideal food as nature can make. Corn should not be fed alone, nor in too great quantities. Bran is a splendid feed and contains material for bone and muscle. A mixture of oats 60 per cent, corn 30 per cent, and bran 10 per cent makes a ration that will enable any colt to grow rapidly. A handful of oil meal may be profitably added. Then he will be more likely to eat enough to almost make up for the lack of milk.

Hay should be provided in plenty. Doubtless alfalfa or clover is the most desirable for young, growing colts. Both hay and grain should be of the very best quality. If it is at all possible to furnish succulent grass for the colt it should be done. This is a big factor in preventing any check in the growth of the youngster.

Company of Other Colts

Naturally the colt will miss the company of his dam. If he has been accustomed to stay in the stable or yard while the mother is out at work there will be less fretting on that account. If the youngster has followed the dam constantly and has never been kept separated from her, he should be broken gradually to stay away from her, if it is at all convenient to do so.

If there are several colts on the farm it is best to wean all of them at the same time. The youngsters love company and if there are two or more of them together, they will fret and worry less.

The stall or pen where the youngster is confined should be such that he cannot injure himself. The door and fence should be high enough so that he will not try to jump out. Nothing but a clean and comfortable place,

with plenty of sunshine and proper ventilation, should be used for the colt during weaning time. It should be made possible for the colt to exercise freely every day.

Management of the Dam

Just before weaning it is best to change the dam from succulent pasture to dry feed. If she is being fed grain, the amount should be reduced to a minimum. This will have a tendency to reduce the milk flow. The colt should then be allowed to suckle only two or three times per day instead of being with the mother all the time or at least over night. It may be necessary to milk out the mare occasionally for a few days, in the case of large milk producers and where there is a tendency for the udder to swell. Having done these things, it will be comparatively simple and easy to keep the colt away from the mother entirely without injury or handicap to either the dam or her foal.

Having made the change slowly and gradually the youngster will not miss the milk greatly. He will eat grain and hay, will take exercise and will grow without any setback. If he is kept healthy, thrifty and growthy, the very best of results will follow.—H. E. McCartney, Assistant in Animal Husbandry, Purdue University, Indiana.

CALIFORNIA CREAMERY OPERATORS ASSOCIATION

I should like to again remind your readers of the dates of the California Creamery Operators Association Convention, in San Francisco, October 28 and 30.

We are now working out the final details of the program and have secured some good speakers for several interesting topics. The program is being arranged so that delegates will have an opportunity to see the Exposition part of the time during the three days. The Exposition Dairy Cattle Show will be on the program during this period and will be of considerable interest to those who attend. We will have our usual Butter Scoring Contest and will arrange to have Butter Judging Contest. Friday, October 29, has been set aside by the Exposition authorities as California Creamery Operators day and we expect a large representation of creamerymen to take part in the exercises. It will be impossible for all the creamerymen in California to attend but every manager, buttermaker, helper, and any others who are interested, should plan to be in San Francisco during the full three days, October 28, 29 and 30.—L. M. Davis

SALE OF GUERNSEYS

On Wednesday, September 15th, at Florham Farms, Madison, N. J., 81 head of Guernseys were sold, which brought at auction \$43,235, this being an average of \$533.76.

While the sale was void of extreme prices, yet there were many sensational features. In several instances where two or three animals were brought into the ring and buyers offered their choice, the bidding became spirited and the person to whose lot the choice fell would take all that were put up.

The highest price paid was \$2500.

The Ideal Green Feed Silo

Built up to High Standard a not Down to a Low Prices

THE PURCHASE PRICE of

All Ideal Green Feed Silos includes acid-proof, water-proof paint for the inside.

A ladder independent of the doors. 3/4 inch hoops instead of 1/2 inch near the bottom, where the pressure is greatest.

A 3-ply circular plate at the top to keep the silo round.

A continuous door front from top to bottom, fitted with the IDEAL Patented Refrigerator Type Door, thus insuring an air and watertight joint.

A thoroughly practical piece of equipment.

GARGET OR MAMMITIS

Sanitation is one of the chief methods of preventing the spread of garget among dairy cows. All litter and yards should be maintained in a clean condition and disinfected periodically. The hands of the milker and also the udders of the cows should be carefully washed in an antiseptic solution before and after milking each diseased cow. It is also wise to avoid careless handling of the cows so that they are not injured. Healthy, vigorous, well-fed and carefully managed animals will often pass through infected herds without contracting the disease.

Milk from cows infected with garget should never be used for human consumption. Care should be exercised to collect this milk in a separate pail and destroy it so as to make it impossible for the germs to spread. It is always a bad practice to milk the affected quarter on the floor or on the ground, and where this is done any bedding or substances contaminated by the diseased milk should be carefully disinfected. For this purpose a solution of carbolic acid, creolin or any other commercial antiseptic should be used. Care should be taken to separate all cows that are suffering with garget from the rest of the herd, and these should be milked after the general herd, says Dr. R. H. Williams, animal husbandman, University of Arizona agricultural experiment station.

The factors causing special susceptibility to mammitis may be given as follows:

Extreme injuries, such as blows, kicks, bruises, violence, etc., may cause local or general inflammation.

Careless milking; allowing the accumulation of milk in the udder or where the milk drops constantly from the teat, thus allowing passage for the germs from the litter and other substances through the open teat.

Animals too fat.

Overstocking.

Driving with distended udders.

Exposures, such as lying on the cold ground, especially after freshening and during severe weather.

Impaired condition of the animal.

Treatment

Ordinarily the animal will overcome the disease in five to eight days of its own accord if given good sanitary attention. After this time the symptoms will gradually disappear but the yield of milk will drop below normal. On this account, certain of the best stockmen in the state recommend nothing in the way of treatment. However, either form of garget will usually respond favorably to prompt action in the early stages. The animal should be given a purgative of about one and one-half pounds of Epsom salts when first noticed. Grain in the ration should be reduced to one-third the normal amount, and a succulent easily digested food given the cow. Hot fomentations may be applied or camphorated oil or soap liniment with a little turpentine or ammonia may be rubbed gently on the affected parts. The udder should be bathed with hot water for at least twenty minutes three times a day, and, after drying, rubbed thoroughly with some warm olive oil containing 3 per cent of gummed camphor. Poultices made of bran, linseed meal, oat meal or other substances that can be placed close to the udder and that will retain their heat a considerable length of time, should be applied. The cow should be milked carefully three times a day, oftener if possible. Where

this can be done by hand, it is better than using the teat siphon. If an abscess forms, it is important that the pus be withdrawn. Some recommend bleeding the jugular in cases where the fever is high, but this is a risky operation.

FEEDING METHODS MUST BE IMPROVED

Written for the California Cultivator By Special Live Stock Contributor

"The biggest lesson that California hog raisers have to learn is that they must feed better." The speaker was a breeder of registered hogs from an Eastern state, who had visited a number of herds on the coast.

"There are as good hogs out here as there are in America and some of the best breeding; and an abundance of feeds for developing a hog to the best there is in him are at hand. Coupled with this is a climate that is about as near ideal as it could be made. The factors are all here; all that is necessary is to put them together in the right way. This puts the problem strictly up to the man behind the hog," continued our friend.

Constructive criticism is a good thing for any man or set of men, and we are grateful to our Eastern brother for his frank expression of his observations.

In a country where it is as easy to get along as in our state, we are apt to let well enough alone and not worry about things too much. Because hogs will live and make money without much care on nothing particular in the way of feed, many of us do not give them the attention we would if we lived in the East, where if hogs are not well fed they are liable to die of exposure during the long, cold winters. But this is no reason why we should not make the best of our opportunities and with all our favorable conditions produce the best hogs in the world.

STUBBLE HOGS COMING

Written for the California Cultivator

Thousands of hogs from the stubble fields of the Sacramento and San Joaquin Valleys will be coming to the markets at San Francisco and Los Angeles soon, and the market is somewhat lower as is to be expected at this time of the year.

There is good money for the grower in these stubble hogs because they are a by-product of the grain-growing business. In many places they are given very little attention at any time of the year, getting fat when there is an abundance of feed in the fields and rustling for themselves the balance of the time.

On some other ranches, however, they are now being given more care, and the hog department of the grain business made more an important issue. This is done by providing some shelter, caring better for the sows at farrowing time, dipping all of the hogs frequently in a disinfectant dip and crude oil, and keeping some feed over from season to season to feed to the hogs when they need it most.

The hogs pay well for this additional care, and many grain growers have found that they are justified in making provision for irrigation from wells or some other source and planting alfalfa so that the hogs may have the benefit of this excellent hog feed.

One improvement leads to another, and as the hogs respond to the better care pure bred boars are bought, and the grading process leads to further profit.

The breeders of pure-bred hogs in California are not able to supply the demand for registered breeding stock, and this condition will probably continue for several years.

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeney, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

CHEAPER MONEY

(Continued from Page 323)

dollars of property and twelve billion dollars of income would be available for one another, and they would become independent of outside assistance.

But this systematic organization of agriculture through cooperation is not possible at present in the United States, because (among other reasons) ordinary banking is not lawful for associations. The credit unions, in the seven states I mentioned, are worse than useless. Their disqualifications are: They must have share capital and cannot adopt the pure associational form; they can admit only natural persons to membership and can do nothing else but take savings and promissory notes from members; they cannot carry on any business for the collective good, join other associations formed for industrial or commercial purposes, nor invest in their stocks or bonds; they cannot discount or accept negotiable paper, while they are deprived the easiest source of funds, because they cannot receive checking deposits from either members or outsiders.

The enactment of laws to enable associations to be formed for all kinds of industrial, commercial, financial and banking objects must be procured before cooperation can be extensively used for organizing agriculture—but this is all that should be asked for. State aid would be as harmful as it is unnecessary. Artificial stimulation would weaken the vitality of any systems depending on it. In order to attain the best and most enduring results, the systems would have to be built up from within by the farmers themselves through the formation at first of the local groups. It is in the local group that cooperative credit has its freest play. The local rural cooperative banks are the basic units for creating and supporting the systems to which they belong, and they should be accorded the powers and subjected to the necessary regulations and restrictions for this purpose. A rural cooperative bank is most effective when it has the character of a neighborhood club, discards capital stock and assumes the pure associational form; for then, since it does not have to distribute dividends, its aim tends towards economy rather than gain; it can continually reduce the cost to members of its credit and other facilities, restrict its profit-takings to its absolute necessities, and use its surplus for creating the indivisible reserve that would eventually make it a substantial and permanent fixture with a large foundation in its locality. But this is not possible under existing laws for the so-called credit unions or for any other associations.

Considered from the viewpoint of agricultural organization, it will be seen that the chief purpose and value of cooperative credit is to create and support a system, so as to organize and strengthen the purchasing and selling powers of the farmers. The resources of the rural cooperative banks should be used for the collective rather than for the individual good of members, so long as there is a common need to be supplied; otherwise the spirit and practice of cooperation would both disappear together. Hence, the making of loans to members is not the primary object of a young bank and cannot be extensively undertaken until the system has been thoroughly established and a surplus accumulated in cash or cred-

it. But this surplus frequently comes all too quickly in a cooperative bank. I venture to predict that the greatest danger to cooperatives in the United States will be the facile credit and easy money made available for them. Cooperative banking is so wonderfully potent and inherently safe that, when once it is started, enthusiasm often runs away with discretion, and a tendency arises to build too fast and lend or borrow too freely.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Cowpox

About five or six days after first dose of one ounce of tincture of iron, given in accordance with your directions of six ounces, one ounce at a time twice a week, my cow's udder broke out with sores about three-eighths of an inch in diameter, irregular in shape and near the base of the teats. Sore would break on pressure of milking and scab would form, last about a week and fall off, and other sores appear. This has continued about a month. Thinking this condition would wear off with the cessation of medicine have used only two per cent carbolated vaseline, keeping the udder clean. The trouble does not seem to diminish. Kindly suggest some course of treatment.—Subscriber, Covina.

There is no doubt that it is a case of cowpox. The tincture of iron could not cause it but might be a help to cure it. When the blisters break and the fluid that they discharge is carried on the hands to a new place it will start a blister there. No internal remedies are needed, but after each milking wash the udder with warm water; rub it dry and then apply a two per cent solution of permanganate of potash to the sores and over the parts that have come in contact with the hands while milking. It is not serious but may be quite annoying. Do not know whether that would interfere with her breeding or not.

Exercise for Bull

How much exercise should a bull have to keep him in good service condition?—Subscriber, Covina.

At least enough to keep him in good health. More is better. A half acre paddock to run in should be all right. Enough exercise to keep a male from getting fat will keep up his breeding qualities.

Deformed Lip

Horse has one side of mouth bulged and out of shape. Seems to be in lip on one side. Eye on same side is blind. Has been so nearly if not all its life. Seems healthy otherwise. Can you give me any information about the trouble or a possible cure?—Subscriber, Nipomo.

Doubtful if anything can be done for it. Probably was caused by an injury and after so long standing it would be hard to cure.

Sick Hogs

What is the trouble with my hogs? They get sore eyes, then lumps come all over their bodies which turn into sores. Some have free range while others are in small pens, but the disease seems to affect all just the same. Have not lost any but am uneasy about them.—Subscriber, Santa Ana.

There is a disease of hogs similar to what you have described that some

call measles, though not the kind that causes measly pork. They usually get over it all right, but it might be well to give each about a teaspoon of phosphate of soda in the feed once a day for a week.

Heaves

I have a six-year-old mare that about a month ago for two or three times got to a stack of damaged alfalfa hay and now has the heaves quite badly. I have been feeding her grain hay in limited quantities with rolled barley, wetting the hay. Had been feeding alfalfa hay before the heaves developed but not now. Have been giving her a few drops of oil of tar twice a day but she does not improve. Please tell me what to do for her.—Subscriber, Pomona.

Heaves is a disease that is not common in California, but musty alfalfa hay or alfalfa hay that is cut too green is liable to cause it. Get the following from your druggist: Fluid extract of stramonium, four ounces, and fluid extract of digitalis, two ounces. Mix, and give one dram every night. One dram is a very small dose but it is enough. Better get a one-dram black rubber syringe and inject the syringeful well back on the tongue.

Indigestion

Have a heifer about two years old that is due to have her first calf in about three months. The last few months she has fallen off in flesh on good feed, alfalfa and oat hay and some green corn. She does not eat or drink well. Is dull and drowsy and seems to have lots of gas on her stomach. She has been tested for tuberculosis and is supposed to be all right.—Subscriber, Chowchilla.

Probably the whole trouble is caused by some alfalfa hay having wadded up in the first stomach in so large a mass that it will not pass. The fermentation from such a mass will cause gas as you describe. Get the following medicine and give as directed: Aloin, one ounce; powdered nux vomica, two ounces; turpentine, eight ounces, and raw linseed oil, two quarts. Mix, shake and divide into four doses. Give the four doses two days apart. Also knead the stomach on the left side with your fist to help stir up the mass so it will separate and pass on. She will probably do all right after a good emptying out.

SILAGE FOR LIVESTOCK

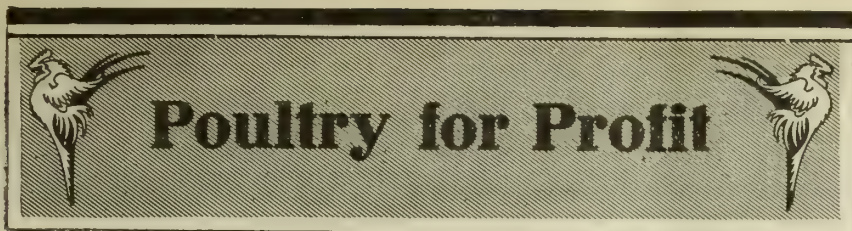

It has been found that silage can be grown and fed to livestock with good results both on irrigated and dry farms in Arizona. This feed makes a splendid supplement for balancing alfalfa hay and may be fed to horses, cattle and sheep, states Dr. R. H. Williams, Animal Husbandman of the U. of A. Agricultural Experiment Station. Where the soil is suitable for pit silos this type of structure will be found the cheapest to install; but on rocky soils and where the water table is close to the surface the above-ground type is best. Concrete, plaster, metal, wood stave and adobe structures have been used with satisfaction in the state. The object in using silos is to store a large quantity of forage in a succulent, palatable form without waste. Silage is not better food than green fodder. It is bulky and should be considered a carbonaceous roughage. On this account the best results are obtained when about 25 pounds of silage are fed each dairy cow or steer per day. Along with this there should be fed about 16 pounds of alfalfa hay and three to eight pounds of grain. This would make an excellent ration for a cow or steer weighing 1000 pounds.

CALIFORNIA JERSEY BREEDERS

The California Jersey Breeders' Association will hold their annual meeting at San Francisco, October 20.

Jerseys will be judged October 19 and 20, and a big meeting is expected.

Speakers of note are expected to aid on the program, and all those interested should arrange to be on hand.—J. E. Sharp, Secretary.

Poultry for Profit

BLACK-HEAD IN TURKEYS

THOUSANDS of turkeys have been lost recently by farmers in the vicinity of Yuma and Buckeye because of a disease commonly called "black-head," states Prof. W. S. Cunningham, assistant animal husbandman of the University of Arizona agricultural experiment station.

Blackhead or enterohepatitis is an infectious disease of turkeys caused by a microscopic organism which attacks the liver and the caeca or the blind pouches of the intestines. It is a very serious disease and in the acute form proves fatal in about 90 per cent of the cases. It is called black-head because in some cases the head of the turkey turns dark purple before death. The disease is spread by the food and water becoming contaminated by the excrement of infected turkeys.

Symptoms

Young turkeys a few weeks to a few months old are most susceptible to the disease. The trouble is not noticed until the disease is far advanced when the symptoms progress rapidly. The turkeys become dull and stupid and sit around apart from the other birds much of the time. The tail and wings droop and the feathers become ruffled. Diarrhea always sets in and the discharges are usually white or greenish yellow color. Ordinarily the disease proves fatal in from three to ten days from the time the symptoms are first noticed.

Post Mortem Findings

To determine definitely whether the disease causing death among turkeys is black-head, it is necessary to examine the internal organs. Either take a bird which has just died or kill one which is in the last stages of the disease and examine the liver and the caeca. A diseased liver will have upon its surface yellowish white spots varying from the size of a pin head to the size of a quarter. The liver is usually enlarged, is easily torn and may have darkened or inflamed portions.

The caeca are the blind pouches of the intestines. By examining the intestines closely, one will find two portions about six inches long which have no opening at one end and which are analogous with the appendix of man. These are the caeca. In a bird suffering from black-head these are greatly enlarged and thickened near the blind end. There may also be found a straw colored fluid in the tissue about the heart.

Prevention

Treatment of black-head has proven of little avail in most cases and it is therefore necessary that stringent methods of prevention be employed. It is believed that the most effective means of controlling or stamping out the disease is to kill and burn the birds showing symptoms of the ailment. Disinfect thoroughly with a 5 per cent solution of carbolic acid all feeding and watering places as well as the roosts, sheds, yards, etc. All drinking fountains or pans should be boiled for 15 minutes every few days. If they are too large to boil handily scrub them out frequently with a 5 per cent solution of carbolic acid. A

good way to prepare the disinfectant for the roosts, houses, etc., is to take 5 parts of carbolic acid to 100 parts of water and add enough lime so that when applied, it will leave the object white in color. This may be applied with a whitewash brush. For applying to the ground or runs, it is best to omit the lime and spray the 5 per cent solution of carbolic acid with an ordinary spray pump. It is also well to keep the feeding places sprinkled with dry slacked lime. Burn all litter about the yards and houses where the turkeys have been.

It is absolutely essential to remove sick birds from the remainder of the flock as soon as the illness is noted and if not immediately killed, they should be kept quarantined.

Keep the well turkeys on the move, that is, change lots every few days as this will limit the source of infection and will allow a more thorough disinfection of the old lots. A still better method is to keep putting the birds on new ground where sick turkeys have not been.

Do not throw dead birds out on the ground to decay and be a source of infection but burn on a pile of wood. In case it is not practicable to burn, bury very deeply and cover with a layer of lime to prevent dogs from digging them up.

Keep before the well birds water in which a little potassium permanganate has been placed. The proper strength for this is about one teaspoonful of potassium permanganate to five gallons of water.

Treatment

While treatment of black-head has met with little success, sulphocarbonate of zinc has proven effective in some cases. This compound is usually obtainable in five grain tablets. Dissolve six five-grain tablets in each quart of drinking water and keep before the infected birds. Successful results have also been obtained from giving each bird a small piece of a tablet about one-half the size of a sweet pea twice a day. However, it is not recommended to treat any but very mild cases.

STATE POULTRY SHOW

The first annual show of the California State Poultry Association, to be held at Sacramento, January 14 to 18, 1916, is going to be one of the biggest shows on the coast. Secretary Wilkins is getting inquiries and requests for premium lists from breeders in all parts of the state every day. He has received as many as 35 letters in one day already and the show is still four months away. The local Sacramento association is putting forth every effort possible to make the show a success in every way and all the local breeders have promised large displays, some of them as high as 150 birds.

It has been decided to have this show judged by score card so that every exhibitor, win or lose, will have something to show for his entry. From the amount of discussion indulged in lately, it appears that a big bunch of breeders are anxious to return to the score card system of judg-

ing; therefore it has been decided to give them a chance to try it out at a big show. Russell, Hinds and Luce have already been engaged to judge. Two or three other judges will be secured so that there will be no delay in getting up the ribbons.

For particulars write to C. A. Wilkins, Secretary, box 1117, Sacramento.

HENS FED BEEF SCRAPS LAY EGGS

That it is a poor policy for farmers not to feed some kind of food to their chickens which is high in protein value, such as beef scraps or sour milk, is the opinion of H. L. Kempster, associate professor of poultry husbandry at the University of Missouri.

Mr. Kempster has recently conducted an experiment which he believes proves conclusively that protein food produces greater results at lower costs.

In three separate pens the same number of chickens were kept. All were fed corn all of the time, wheat part of the time, and in addition ground grain rations of bran, middlings and corn meal. Besides this regular feed for the chickens in all three pens, those in pen one were fed beef scraps, and those in pen three were given all the sour milk they wanted. The hens were about the same age. The experiment covered the time between November 1 and June 1.

Those hens in pen two, given only the regular feed, produced only 800 eggs; those in pen one, given beef scraps, produced 1518 eggs, and those in pen three, fed sour milk, produced 1425 eggs. The hens in pen one ate 923 pounds of grain, those in pen two 944 pounds and those in pen three 836 pounds.

The amount of beef scraps fed to the chickens in pen one was 60 pounds, costing \$1.80. These hens produced 718 more eggs than those chickens fed only the regular ration. In other words, these chickens produced 718 additional eggs on feed which cost but \$1.80 more than the regular ration. Those hens fed sour milk produced nearly as many eggs as those fed the beef scrap ration.

All farm machinery must be simple and efficient in construction simply because the average farmer or farm hand could not understand the assembling and working of a more complex farm machinery.

Poultrymen STOP HATCHING FEED BILLS Hatch Bank Balances HOW? Use Vegetine

We can save you from ten to twenty-five per cent on your feed bills. This means the difference between success and failure in the chicken business.

We have a wonderful new poultry food that contains more protein than Bran, which sells at a price thirty-five to fifty per cent cheaper than Bran. Write for circular, "Food for Thought and Feed for Chickens," which tells all about this great money saver.

Mr. C. H. Kline of Burbank, Cal., one of the largest and most successful poultry raisers in Southern California, buys this food in carload lots.

Globe Grain & Milling Co.

SCHOOLS AND COLLEGES

Wanted—About seventy-five young men and women to enter The WESTERN NORMAL on August 30th, to prepare for teaching. Western Normal graduates secure and hold good positions. We assist graduates to secure good positions and promotion. We save you time and money. For information, address WESTERN NORMAL, J. R. Humphreys, Principal, Stockton, Cal. 634 E. Main St.

Telegraphy—Stenography, bookkeeping, English branches. Positions guaranteed. Mackay Business College, Los Angeles.

LIVE STOCK

I have another crop of seventy-five head of BIG TYPE POLAND CHINA BOARS, born in February, sired by IOWA WONDER, who is a son of A WONDER, the GREATEST POLAND CHINA BOAR, LIVING OR DEAD. IOWA WONDER is in the 1000-LB. CLASS. One of his sons from one of my good registered sows should make YOU MONEY. I will sell the best first. On account of being overstocked will sell them at \$20 each while they last, but they will not last long at this price, so ACT QUICK if you want an EXTRA GOOD BOAR FOR LITTLE MONEY. Geo. A. Smith, Corcoran, Cal.

Billiken Herd—Pure bred, pedigreed O. I. C. swine; the big white kind. Ready for immediate shipment; weaned pigs of both sexes; pairs and trios; mated not akin. All these pigs are from big type stock, of extra heavy bone; weight, with early maturing quality. Immunized against hog cholera; crated and registered free. Write for descriptive circular and price list. C. B. Cunningham, Mills, Sacramento County, California.

Del Dayo Farm (Old Haggin Bottom Ranch) Registered Berkshires, both sexes and from weanlings to one year old. Now ready a few choice Gilts safe in pig and some very choice 10 mos. old Boars and every sale absolutely guaranteed satisfaction. Stephen S. Day, Sacramento, Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Beeding. BERKSHIRE HOGS. Finest Lard in the state. All ages for sale. A. B. Humphrey, proprietor. Mayhews, Sacramento Co., California.

Cattle Instruments of every description at the right price to be had at O. J. Weber Co., manufacturers and importers of Machinery, Silos and Appliances for the Dairy and Creamery, 759 So. Los Angeles St., Los Angeles, Cal.

For Sale—Pedigreed Thoroughbred Duroc Jersey Hogs, Gilts open or bred, weaned pigs \$15.00 each. S. C. Rhode Island Cockerels, Flemish Giants, New Zealand Reds, Belgian Hares. John Kincaid, P. O. Box 151, Bakersfield, Cal.

Thoroughbred Poland China Boars of large type for sale. Buy at home and save express. Prices reasonable. For further particulars write to Maywood Colony Nursery, Corning, Cal.

For Sale—Registered, Berkshires. 25 choice pigs of best breeding from the best strains in America. For prices and description address H. L. Murphy, Perkins, Sacramento Co., Cal.

Blue Ribbon Herd Duroc-Jersey Hogs. Service Boars and Bred Gilts a specialty; also boar and two sows, not related. Meet me in S. F., 1915, prices. John P. Dages, Modesto, California.

DUROC JERSEY BOARS. Trios of boar and sows not akin of the best blood lines at reasonable prices. Write me. L. L. DeYoung, Sheldon, Ia.

For Sale—At all times, Jacks and Stallions driving and saddle horses. Price and stock guaranteed. Phillips and Kingsbury, 2318 G Street, Sacramento.

Poland Chinas—200 head fine individuals, weanlings to eight months. Satisfaction or money refunded. Geo. V. Beckman, Lodi, Cal.

Berkshires—Pedigreed Boars ready for service. Bred sows, weanling pigs, both grade and thoroughbred, finest stock. C. H. Thompson, Novato, Cal.

Calves Raised Without Milk—Cost less than half as much as the milk raised calves. Write for free book to Coulson Co., Petaluma, Calif.

28 Springing Holstein Helpers and Registered Bull—fine milk strain. \$1500.00 takes them. E. H. Webb, Escondido, Calif.

Registered Thoroughbred Berkshires of all ages; Cholera Immune; large boned. Ricconi Bros., Mountain View, Cal.

Poland Chinas—Young stock; either sex. Write for pedigree. Reasonable prices. Edw. A. Hall, Watsonville, Cal.

Glennview Poland China—Stock for sale. Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.

For Sale—Thoroughbred Duroc Jersey Boars and Gilts, strong and vigorous stock. Fred Hart, Exeter, Cal.

Berkshires—Boar pigs for sale. Butte City Ranch, Butte City, Glenn Co., California.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

WANTED

Wanted—Orchard ranch to work or manage. Have made it a life work and study. You furnish equipment and I will do the rest. Have wife; no children. References furnished. Geo. H. Osgoodby, 610 San Gabriel Ave., Azusa, Calif.

Wanted—Home in country for 10-year-old orphan boy. Is well trained, industrious, bright, strong and quiet. Needs a mother's and father's interest. Will adopt to right people. H. H. Eshelman, Soldiers' Home, Cal.

Wanted, good farm land in exchange for income property. J. H. Wood, 422 Van Nuys Bldg., Los Angeles, Cal.

Wanted to hear from owner of Farm or Fruit Ranch for sale. O. O. Mattson, Minneapolis, Minn.

Wanted—To hear direct from owner of good farm or unimproved land for sale. C. C. Buckingham, Houston, Texas.

Pear Orchard—20 to 40 acres, Banning-Beaumont or Teahap section. Lease or buy. Frank Clyne, 2042 W. 24th St., Los Angeles, Cal.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckebers Press, 237 Franklin St., Los Angeles.

FARM LANDS FOR SALE

The owner of 3000 acres near Madera desires to subdivide for real settlers; the land is typical San Joaquin valley loam, free from alkali, and will grow anything; railroad crosses property and there is abundant water at shallow depth; the land is for sale at the right figure to people with proper qualifications; no cash payment down and terms to suit, provided the purchaser has sufficient money to put the land under water. Remember that there are no real estate commissions to pay to swell the price of the land; all the owner wishes is interest on his money. No real estate agents need apply.

GREENE ESTATE COMPANY, 207-208 Berkeley Bank Building, Berkeley, Cal.

For Sale—14 acres, one mile from the business center of the city; all improved; modern bungalow, good barn, tank and windmill, chicken house, brooder house and pens. Fine opportunity for raising chickens; 11 acres in alfalfa, family orchard, berries, etc. Address, Mrs. Anna Stromwall, R. F. D. No. 2, Box 8, Merced, Cal.

Good Government Land relinquishment of 160 acres for the price of the improvements and work done; house, barn, fencing, fine climate, wood and water, \$650 cash. W. Wallace Baldy, Raymond, Madera Co., Cal.

Cheap—Six acres Blue Gum Eucalyptus, El Cajon valley, county of San Diego, near railroad; trees over 3 years old; price very reasonable; must sell immediately. Further information, price, write A. P. Schummers, 100 N. Franklin, Austin, Minn.

State Map Showing School Land in different counties of the State, plainly marked, \$2.50. County sectional maps, showing vacant U. S. Land, plainly marked, \$2.50 each. Order TODAY. Booklet, FREE. Joseph Clark, Sacramento.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale or Exchange for Southern California acreage, 4 acres fine bulb or vegetable land in city of Santa Cruz. William Richard, owner, 438 River St., Santa Cruz, Cal.

SEEDS AND PLANTS

Our "West Coast Seed Store" has been leased over our heads and we don't want to pay Los Angeles high rents. A good, well posted Traveling Seed Man said he wished he could buy our stock and move it to another town where there is none, the best opening he knew of for a good Seed Store, and we agreed with him. Could also swing there most of our Mail Order business. Our stock and fixtures are for sale at a big bargain. We also sell Poultry Supplies and manufacture Poultry Foods and Proprietary Articles at a good profit. Would accept good clear real property for all or part of the same. This is a good chance for someone, but demands QUICK ACTION. Might sell part to real good party and retain part interest. But I have other business that takes most of my time. Come and see me or write me here at once and I will arrange to see you. T. S. Tompkins, 116 E. 7th St., Los Angeles.

Best, Cheapest Forage for poultry, cattle, hogs. Get our prices. Plant now. LUTHER BURBANK SPINELESS CACTUS PLANTATIONS, SAN DIMAS, CAL. Covina phone 902.

Burbank Spineless Cactus—Hardest varieties, "Melrose" and "Special." Strong, matured slabs, \$8.50 per 100; \$50 per 1,000. Labranza Ranch, Athlone, Merced Co., Cal.

Tepary Beans For Sale—I have a limited amount I will sell for 6 cents. F. O. B. Redlands. Buy your seeds while they are cheap. Planting time this year they sold for 22 cents. A. B. Ward, Yucaipa, Cal. Peruvian Alfalfa Seed—Hairy varieties, also Algerian wheat. S. P. Huss, Yuma, Arizona.

MISCELLANEOUS

We Will Pay You \$120.00 to distribute religious literature and take orders in your community. 60 days' work. Man or woman. Experience not required. Spare time may be used. INTERNATIONAL BIBLE PRESS, 936 Winston Building, Philadelphia.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco

PUBLIC SECURING RIGHT TO ROAD

(Continued from Page 317)

last two years as a shortcut to a neighborhood settlement about three miles from my ranch. I do not want to fence this portion of my land until I am ready to fully develop it, neither would I care to inconvenience unnecessarily or prematurely the traveling public until I am compelled to do so in order to hold title to the road in question.—Subscriber, San Francisco.

The method adopted from time immemorial to avoid the ripening into title by prescription of a right-of-way, is as follows: On one or two days of each year the owner of the land bars the road and refuses to allow anyone to pass except by permit granted by the owner.

Commuting On Homestead

Can one prove out at the end of 14 months by paying a dollar and a quarter an acre, or did the new

three-year law do away with that?—Subscriber, Oakland.

The right to commute upon homestead entry upon payment at the expiration of 14 months' residence is retained. The only exception being that as to lands taken up under the act providing for the entry of additional lands, the right to commute does not apply.

Buying Realty On Contract

I am buying a piece of property on a contract. When I have paid more than one-half of purchase price I am to get a deed. My next payment will make more than one-half of the price and the seller says it will cost me a good deal to get my deed as I must pay for the title certificate. Can I get a Torrens title without having a certificate from a title company?—Subscriber, Downey.

It is very probable that it would cost you more to obtain a certificate under the Torrens act than a good title company would charge you. It is also more than probable that the duty is not upon you to pay for the certificate, but is upon the party who is selling the land to you, as it is almost invariably the rule that the vendor pays for certificate showing title in the vendee, although the vendee may be required to pay a portion of the escrow charges, which are but nominal, however it is to be understood that this is governed by terms of your contract.

Forged Name on Note

On October 22nd, 1913, B. forged A's name on a note for \$100 on a bank, getting C's name also on it by saying A. had signed it. When A. heard of it he went to the bank and told them it was a forgery. A. died January, 1915, all his property having been deeded seven years before to his wife. The bank is now trying to collect. Twenty dollars has been paid on principal and C. says he will pay \$40 if A's wife will do likewise. Can the bank collect from her under those conditions and what would it cost to fight and try to show it was a forgery? There are about 60 signatures could be produced. And are banks allowed to loan money without seeing the notes signed?—Subscriber, San Diego.

A having died, in order to obtain any judgment upon any obligation it would be necessary to have an administrator appointed as service cannot be made upon a dead man. The administrator being appointed a claim duly verified would have to be presented to the administrator and upon the refusal of the administrator or of the judge, suit would then have to be brought thereon. The judgment could only run as against the property or the estate and if the man when he died did not have any property, no satisfaction could be obtained. The expense would therefore be entirely upon the bank, as the wife of the deceased man is not in anywise liable and the expense incident to the collection would in this case be so large as to be an absolute deterrent on any attempt of collection by the bank. There is no requirement that an officer of the bank should see a note signed.

Responsibility for Partnership Note

Three men enter into a partnership and borrow a sum of money. One partner, a single man, dies and his estate is settled out of court, without settling his part of this note. The business venture is a failure. Would the settlement of the estate invalidate this note, and how long a time would the holder of this note have before it would be outlawed.—Subscriber, Covina.

An estate cannot be legally settled otherwise than by being administered through the courts. In order to enforce any claim other than one that has been specifically secured, as a mortgage, it is necessary to obtain an administration upon the estate. A note outlaws four years after date upon which it is due, unless there has been an acknowledgment of the debt in writing within that time.

The record has been broken by the packing house of the California Fruit Canners' Association at Visalia which has just closed the season with an output of 175,000 cases.

Curing Pampas Plumes

Please give information regarding curing of pampas plumes.—Subscriber, Chino.

The best answer we have found is written by Joseph Sexton of this state for Bailey's Cyclopaedia of Horticulture, published by the Macmillans, N. Y. He refers to the fact that the growing of pampas plumes is not as profitable as it was at one time and gives other information regarding the plant as to curing. Mr. Sexton says:

"The appearance of the plumes is a signal for great activity among those who have large fields. The grass should be so trimmed early in September, before the plumes appear, that each hill will be easy of access. Young plants ripen their plumes two or three weeks earlier than old ones, and some varieties are earlier than others. It requires exercise of judgment to pick the plumes at the proper time. They are generally ready when they are exposed from the husk a few inches and have a fluffy look. It is well to try a few at this stage, and if they cure well at the stem end when dry, they are all right, but if they do not become fluffy at the stem end they have been picked too young. If the plume looks dark and seedy at the top when cured, it was too old when picked. Some varieties, especially those producing very long plumes, should be allowed to remain somewhat longer on the plant than those of the short-plumed varieties. By trying a few of each variety, the time of ripening can soon be ascertained. Some varieties are pulled from the husk in the field; others have to be hauled to husking benches, where the husk or sheath is removed. Some planters husk them like corn; others use a knife set in such a way as to split the husk without injuring the plume. When the husk has been split, a quick jerk or strike on the table will extract the plume. The plumes are then taken to the drying ground and evenly spread in long rows. This ground should be made smooth and free from any trash that is liable to adhere to the plumes. Clean stubble ground is the best. The plumes are left on the ground three days and two nights to cure, and are turned and shaken once each day. They are next packed away as broadly and smoothly as possible on shelves in a dry building, where they should lie ten days or two weeks, or until the stems are thoroughly dried, at which time they are ready for market. They are packed in two grades: The first class, having plumes 26 inches long and over, clear of stem (sometimes as long as 45 inches); in second-class stock the plumes are 17 to 26 inches long, clear of stem. If shipping by express, the writer uses bales of about 2000 plumes covered with canvas or burlap, and some light strips of wood at the corners. If the plumes are packed smoothly and evenly they will withstand heavy pressure. Careful, all-round cultivation is necessary to produce good plumes."

Crossing Leghorns and Minorcas

What will be the result of a cross between White Leghorns and White Minorcas, where good layers only are desired, and how should one proceed to get best results with such a cross?—Subscriber, Holtville.

We do not believe there is anything to be gained by crossing breeds. In fact, we believe the danger is great that a strain may be produced which is lower in production than either of the parents. However, we know many poultrymen have thought otherwise. We recall well that years ago one poultryman persisted for many years in crossing Brown Leghorns on Barred Rock hens. The following year he secured pure-bred Barred Rock roosters, changing back and forth each year. He maintained that he got harder stock, but at best these are only mongrels and do not give the satisfaction in handling nor do we think as much profit as the pure breeds.

Trees Per Acre

Please give information regarding different systems of setting out orchards and of determining the number of trees per acre, planted say 40 or 45 feet apart.—Subscriber, Alhambra.

The matter of general tree planting is touched upon in our issue of February 11, 1915, and will be given again perhaps in December, when the planting season will be on. To answer more directly our subscriber's inquiry, if trees are 40 feet apart there are required 27 trees for each acre; if 50 feet apart, it will require 17 trees per acre; 30 feet apart, 48 trees per acre; but to enable our inquirer to determine for himself, will say there are 43,560 square feet per acre and if trees are set square and say 20 feet apart, there are 400 square feet required for each tree; that is, 20 by 20 makes 400 square feet. Now then, to determine number of trees required

for the acre, divide 43,560 by 400 and the result is 108 trees. By using this rule, no matter what the distance apart or whether the same distance prevails each way of the field, this rule will work.

Oily Butter

I recently bought a fine looking cow claimed to give six gallons per day. It was promised that she was to be fresh in April or not later than the first of May. Found her gentle and an easy keeper but she failed to come fresh as claimed. Though we dried her off she did not freshen until September. The calf died within three days. The milk became good at eight milkings. Am giving baled alfalfa, two quarts of beet pulp soaked and three pints of "sure-milk" and a pint of cottonseed meal, with salt before the cow constantly. Also feed cow pumpkins, carrots or beets at noon. The butter comes more like oil than butter. Have tried all temperatures. The only way we can get any butter is to work in ice water. In addition the cow gives less than four gallons.—Subscriber, El Cajon.

Dr. Leroy Anderson replies to the inquirer as follows:

"Possibly feeding more cottonseed meal will so harden the butter fat that the churning will be made more simple. Cottonseed meal has a tendency to increase the hardness of the butter and it may be fed safely up to at least four pounds per day. The results of some experiments in feeding at the South Carolina Experiment Station indicate what may be expected. When 10 pounds of wheat bran were fed with 45 pounds of corn silage, the melting point of the butter fat was 92.9 degrees. When six pounds of cottonseed meal were fed with 45 pounds of corn silage, the melting point of the butter fat was 98.6 degrees. When six pounds of linseed meal were fed with 45 pounds of corn silage, the melting point of the butter fat was 91.5 degrees.

"This shows that cottonseed meal has the faculty of making a much harder butter than linseed meal or bran. However each of the above three feeds were given in excess amounts in these experiments, i. e., more than one would want to feed as a daily practice. It would pay the subscriber to experiment on his feeds, using alfalfa hay, beet pulp and cottonseed as a basis

and try supplements with other available feeds, such as the roots and pumpkins and also oat hay and rolled barley for instance. In churning be sure that the cream is well ripened and do not add any sweet cream less than twelve hours before churning. It may be that the cow has a habit of producing a very oily fat, in which case there may be no cure. One can merely experiment, knowing that cottonseed meal, grain hays, rolled barley, etc., have a tendency to make hard fat."

Soil Analysis

Please give information how to make a complete analysis of soil, also for the content of humus, potash, phosphoric acid and alkali.—Subscriber, Santa Ana.

The best procedure would be a course in chemistry in some educational institution. In case of inability to take such course it is possible one might secure information through a correspondence course. In any case, laboratory equipment would be necessary. Soil analysis is a very complicated process and even when made by the expert who understands his business is often unintelligible to the layman. On this point we quote from Fertilizers and Crops by Van Slyke: "Usually a soil analysis is made by treating a sample of soil with a dilute acid; it is supposed that the amounts of plant-food constituents thus dissolved approximate the proportions that are more readily available for the use of plants. When these results are compared with actual crop growths on the field from which the sample of soil analyzed is taken, wide discrepancies often occur. The actual value of soil analysis in determining positively and definitely the plant-food needs of a soil has been and is still a matter of dispute. All agree that the results of soil analysis are negatively helpful in enabling one to reach conclusions, when it is shown that the total amount of any plant-food constituent is present in very small amount or wholly absent. However, there appears to be no general agreement as to what shall be regarded as the lowest amount of any particular plant-food constituent calling for special addition to meet crop growths."

Close observation of soil, especially as to its physical condition is valuable, and there are times when the advice of an expert is necessary. Possibly in time we will need the soil doctor or chemist to prescribe.

"Creeping Grip" Tractor of General Utility

Plowing is Only One-Third of Your Work. The "Creeping Grip" is the Rancher's Best Friend.

This tractor materially reduces the cost of plowing, harrowing, seeding, harvesting and hauling. The creeping principle provides more than five times the tractive surface obtained with the wheeled tractor. The bearing surface on the ground is wide and long and keeps the tractor on top of the ground and does not pack the soil or bury itself.

Have you a tractor problem? We can supply you the size tractor best suited to the work you have to do. On exhibition in Los Angeles. Catalogues for the asking.

The Drink that keeps STRONG MEN STRONG

Ghirardelli's Ground Chocolate is an inimitable blend of finest cocoa and pure sugar.

Scientists who have made exhaustive analyses of all sorts of food products say that cocoa products are self-sufficient as a nutriment, possessing all properties needed not only for sustaining life but also to repair bodily waste. Cocoa contains a larger percentage of nutriment than even the egg.

Drink a cup of Ghirardelli's Ground Chocolate daily. It's easily and quickly made. It's delicious. It makes the strong stronger.

Order from Your Grocer Today

Ghirardelli's The Only Ground Chocolate

In ½-lb., 1-lb. and 3-lb. hermetically sealed cans. There's a double economy in buying the 3-lb. can.

D. GHIRARDELLI CO.

Since 1852

You are invited to visit the Ghirardelli Pavilion at the Panama-Pacific International Exposition and see a model chocolate factory in operation

The Tenth Year of Cumnock Academy Opens September 28

Parents who are planning to have their daughters enter the school this year should consult immediately in regard to registration. Call, telephone or write for complete information.

Cumnock Academy

is an accredited school, its graduates being admitted to the better universities and colleges without examination. Two courses are offered—college preparatory and general. Carefully chosen faculty, whose work is supplemented by special courses given by the CUMNOCK EXPRESSION SCHOOL faculty.

A sub-preparatory department, offering the seventh and eighth grade subjects, is also maintained.

Cumnock Academy occupies beautiful buildings and grounds in a charming, retired location. All outdoor sports—gymnasium, basketball, tennis, horseback riding. Limited number of boarding students. Write for catalogue.

CUMNOCK SCHOOL OF EXPRESSION

Twenty-second Year Begins Oct. 4

All phases of Literary Interpretation—Story Telling, the Dramatic Art, Public Speaking, Art Appreciation. Write for Catalogue.

The Household Department

GOD OF THE OPEN AIR

From the prison of anxious thought
that greed has builded,
From the fetters that envy has
wrought and pride has gilded,
From the noise of the crowded ways
and the fierce confusion,
From the folly that wastes its days in
a world of illusion,
(Ah, but the life is lost that frets and
languishes there!)

I would escape and be free in the joy
of the open air.

By the breadth of the blue that shines
in silence o'er me,
By the length of the mountain-lines
that stretch before me,
By the height of the cloud that sails,
with rest in motion,
Over the plains and the vales to the
measureless ocean,
(Oh, how the sight of the greater
things enlarges the eyes!)

Draw me away from myself to the
peace of the hills and the skies.

By the faith that the wild flowers
show when they bloom unbid-
den,

By the calm of the river's flow to a
goal that is hidden,

By the strength of the tree that clings
to its deep foundation,

By the courage of birds' light wings
on the long migration,

(Wonderful spirit of trust that abides
in Nature's breast!)

Teach me how to confide, and live my
life, and rest.

—Henry Van Dyke.

A RIDE WITH XERXES

WOULDN'T you like to take a
little ride with Xerxes this
morning?"

The speaker was Mrs.
"Cap'n" Bryce Hodgkins,

who was pouring coffee at the break-
fast table; the person spoken to was
her husband, who had returned only
the night before from a voyage; and
the person or thing spoken of was a
certain roan horse that the captain,
who perhaps was not so well versed
in equine as in maritime matters, had
purchased just before leaving home.
The time was early fall, and the scene
was laid in a pleasant, roomy house
of the colonial type, that overlooked
the sparkling waters of a bay.

"Lucy thinks that she must go home
this morning," Mrs. Hodgkins con-
tinued, nodding toward an elderly
lady, seated at the table, whose face,
although lacking the captain's master-
ful look, nevertheless proclaimed her
his sister, "and I thought that you
might like to take her over, and then
keep on to Bayport and do an errand
or two."

"What kind of a horse has he turned
out to be? Given you any trouble?"
asked the captain, postponing his
reply.

"Oh, none to speak of. Xerxes isn't
a vicious horse, but he is a little no-
tional, and he likes to have his own
way. Just give him a slack rein and
humor him a bit, and I think you will
get along with him very well. I've
driven him almost every day while
you have been gone."

The captain, who was known as a
disciplinarian on shipboard, laughed a
little grimly. "I don't know much
about humoring," he said, "and I
rather prefer to have my way."

"Well, I guess nobody that knows
you will dispute you there, Bryce
Hodgkins," said his sister, but not
aloud.

Miss Lucy often lacked the courage

to give audible expression to her
views, but on such occasions she had
a habit of relieving her feelings by
being particularly plain-spoken—un-
der her breath.

She exercised that privilege an hour
or two later that morning, while driv-
ing with her brother along a quiet
road, sweet with woodsy odors and
the breath of the sea.

"I suppose you've come back," so
her thoughts ran, "just as set against
poor Laura and her husband as when
you went away. And without the least
sense or reason, either! Why
shouldn't Laura marry a fine young
man like George Willard if she want-
ed to, even if his father and hers did
have a falling out years ago? She
was of age, and knew her own mind.
And suppose you did say, first off,
when you got home from sea that time
and found out what had happened,
that you would never show your face
at the Willard place or have anybody
of the name come to yours—isn't a
bad promise better broken than kept?
It's just your pride and obstinacy
that's making your daughter and your
wife suffer—and yourself, too, for that
matter. I've a good mind to tell you
right out loud just what I think of
you!"

But when she really found her voice,
it was only to say, quite timidly,
"Laura's baby looks an awful sight
like you, Bryce."

The captain made no reply, but to
the horse he said sharply, "Get along,
will you!" and struck him with the
whip.

This action Xerxes promptly resent-
ed. He did not exactly kick, but he
lifted his hind feet in a highly disre-
spectful manner, and switched his tail
over the reins, causing them to drop
from the captain's hands.

"Oh, you mustn't whip him, Bryce!"
exclaimed Miss Lucy, in alarm. "He
won't stand that. When Rachel wants
him to go faster she does like this,"
and pursing her lips, she produced a
sound that caused Xerxes to move at
a somewhat accelerated pace until he
reached a considerable ascent in the
road.

Here he stopped and looked back
suggestively. "He always does that
when he comes to a hill," Miss Lucy
explained. "He expects somebody to
get out. Rachel always does, to please
him, and then she generally gives me
the reins and climbs into the back of
the wagon herself, and drives up the
hill that way; and Xerxes seems to be
perfectly satisfied. I am hardly spry
enough for that, but I would just as
soon walk up the hill."

"You'll do no such thing," said the
captain. "Go along, you old rascal!"
he shouted, reaching for the whip.
"Or," he added, as the horse remained
stationary, "I don't know but I'd just
as lief walk up the hill. I believe I'd
like to stretch my legs. But if he sup-
poses I'm going to do it every time,
he'll find his mistake."

The hill surmounted, all went well
until, at a turn of the road, an auto-
mobile came in sight. Again Xerxes
stopped, and at once began frantic
demonstrations of disapproval.

"He doesn't like those things," said
Miss Lucy, "and I don't blame him.
Just wait a minute!" she called to the
driver of the car, who had also
stopped.

"Now, Bryce, we'll have to get out;
and you take my shawl and put it
over his head, and lead him by. That's
the way Rachel did the other day, and
it worked."

This advice was at first not at all
well received. But the captain, who
would never have quailed before a
mutiny on the high seas, was becom-
ing a little afraid of Xerxes; and be-
ing unable at the moment to think of
anything better to do, he finally blind-
folded the horse in the manner sug-
gested, and led him safely past the
object of his dislike.

"Those people laughed!" said Miss
Lucy, indignantly, as she resumed her
seat in the wagon.

"And well they might!" roared the

captain. "I'll never be caught in such a ridiculous performance again!" He jerked the reins.

At this, Xerxes broke into a gentle canter that soon became a gallop.

"Don't pull on him!" cried Miss Lucy. "You want to drive him with a slack rein, just as Rachel said."

But the captain, bracing his feet, only pulled the harder, while the horse dashed on in his mad career.

They were now approaching the old Hodgkins homestead, where Miss Lucy, since the death of her father, the old captain, dwelt alone, and it certainly seemed that she would be carried by.

But Xerxes, apparently thinking that the joke had gone far enough, came to a stop opposite her gate so suddenly that the occupants of the wagon were almost thrown from their seat.

"I'll sell that horse, or give him away, before I sail again!" declared the captain, as he assisted his sister to alight. "He's altogether too cranky for a woman to drive."

"Now Rachel doesn't have a bit of trouble with him," protested Miss Lucy; "but then, Rachel always was quite a manager."

"And the land knows she's had experience," she added, as her brother drove away. "Xerxes isn't the only cranky creature that the poor woman has had to deal with."

Meanwhile Xerxes was jogging peacefully along at a gait of his own choosing, while the captain, holding the reins loosely in his hands, was considering another task that would presently confront him. In the course of his journey he would soon come to the Willard place; and it was his purpose to drive by it looking straight ahead, with all the cool indifference of a perfect stranger; but he was beginning to realize that this might not be altogether easy, considering how his eyes were aching for the sight of a face that he loved.

However, he shut his teeth together firmly, and just before he reached the lane, some two hundred yards in length that led up to the Willard house, he turned his head and surveyed the landscape on the other side. Xerxes, on the contrary, turned his head toward the house, and suddenly veered into the lane with all the lively interest of a horse that is homeward bound, with rest and refreshment near at hand.

"Whoa, back!" called the captain, tugging at the reins. Thereupon Xerxes, simply increased his speed, not seeing fit to obey the command until he had conveyed his passenger in fine style to the front door.

Thus Capt. Bryce Hodgkins, in spite of his vow, was a visitor at the Willard place, and, as it seemed, a very welcome one; for a young woman rushed out of the house and threw her arms round his neck, just as she had done many a time in the days gone by.

"You couldn't stay away from me this time, could you, father?" she cried, joyfully.

"No, I couldn't seem to," he replied, submitting himself, not altogether ungraciously, to her embrace.

"Now come right in, father," said the young woman, still clinging to him. "Baby is asleep, but you don't need to be quiet. I want him to wake up, anyway." And the captain, somewhat dazed in mind, but strangely light of heart, entered the house, leaving Xerxes contentedly nibbling the grass by the door.

Miss Lucy, after her brother's departure, had been struck by a thought; without even stopping to remove her bonnet, she had seized the spy-glass that had been her father's property,

and ascended to the attic, where she could command a view of the road past the Willard place. She witnessed her brother's entrance into the lane, although she could not see what occurred at the door. But after watching in vain for his return to the road, she drew conclusions that brought a knowing smile to her face.

"Yes," she said, with a sigh of satisfaction, as she laid down the glass, "I always maintained that poor Rachel was quite a manager."

IDEAS FOR THE COOK

Written for California Cultivator
By Isabel Cottle

Breakfast

Rolled Oats with Raisins . Cream
Scrambled Eggs Pop-Overs
Quince Honey Coffee

Lunch or Supper

Beef Croquettes Baking Powder Biscuit
Egg and Lettuce Salad
Baked Apples with Cream Doughnuts
Tea or Milk

Dinner

Delicious Chicken, Mashed Potatoes
Okra, Drawn Butter Sauce
Cabbage Slaw
Angel Cake Snow Pudding
Coffee

Delicious Chicken

Cut up a good chicken as for frying, then soak it in salted water for twenty minutes, rinse and spread in a pan, being careful not to pile up the pieces. Cook in a hot oven, keeping in the pan just enough water to prevent drying out. When it begins to get tender, turn the pieces over, dot plentifully with butter, sprinkle with pepper and put back in the oven until brown. Place the chicken on a platter of hot toast. Thicken the juice with a little cornstarch or flour, pour in one cup of milk or cream and bring to boiling point. Add the giblets cut up, and four hard cooked eggs chopped fine. Pour over the chicken.

Cabbage Slaw

Choose cabbage that is crisp and tender. With a sharp knife shave in long thin shreds. Place in granite kettle with just enough water to keep from sticking and steam 10 or 15 minutes until slightly tender but not soft. Season with salt, white pepper and a level tablespoon of sugar. Then add two beaten eggs and half a cup or more of thick cream, either sweet or sour. Let boil up, remove from fire and when slightly cooled add vinegar to taste.

Angel Cake

Whites of five eggs, half teaspoon vanilla, half teaspoon cream of tartar, two-thirds cup granulated sugar, half cup pastry flour. The secret of success in making angel cake is to have the eggs fresh and very cold, to beat as little as possible and to bake slowly. Prepare everything before breaking the eggs. Grease a tube pan. Sift the flour and sugar together three or four times. Beat the whites of the eggs a little, add the cream of tartar and beat until absolutely stiff; then add the flour and sugar mixture, a tablespoon at a time, sprinkling it on the eggs lightly and mixing very gently. Flavor and pour in the pan. Bake half an hour in a rather slow oven. The batter ought not to be thicker than boiled icing.

Pop-Overs

Heat iron gem pans or pop-over cups in the oven until thoroughly heated through; butter well, and fill one-half full of the following mixture: One cup flour, sifted with ¼ teaspoon salt; add very gradually ¾ cup of milk, and then 2 well beaten eggs; beat with an egg beater 2 minutes. Bake in a moderate oven 30 to 35 minutes.

Quince Honey

Quince honey is a delicacy that must be made in small quantities. Pare and grate three large quinces, add three pints sugar, and two pints water; place in a vessel and boil from 20 to 30 minutes. The grated fruit should remain in small particles and the sugar and water form a jelly. Put in glasses and cover with paraffin.

This **Karo**
(REG. U.S. PAT. OFF.)

Premium Griddle

LABELS from 50c worth of Karo (blue or red) and 85c brings you fine 10 ½ inch aluminum griddle by parcels post prepaid. This Karo griddle, light and easy to handle, bright as a new dollar and needs no greasing, therefore no smoke. Heats uniformly all over, is very economical, will not rust, is easy to keep clean—and

MAKES THE FINEST GRIDDLE CAKES YOUR MEN FOLKS EVER TASTED.

This griddle re-tails regularly at \$2.25. Send your order for the Karo Aluminum Griddle today. This offer will prove popular. Place your order promptly.

HAY

Under date of September 25, 1915, Scott, Magner & Miller say:
Receipts for the past week were 2641 tons. For the three preceding weeks, 3686, 4047 and 5311 tons respectively. The fields are about cleared and practically all hay is now under cover with the result that season storage charges will have to be paid even though hay should be moved from the warehouses at this time. We look for the market to advance at least enough to cover

these charges and as there is no doubt among the holders of hay that the crop this season was decidedly short and below normal, we do not believe they will be in any hurry to move stock from the warehouses until prices advance so as to show a profit. Fancy grades are scarce. This applies both to wheat and red oat and receipts of this kind have moved off readily and at our top quotations. It is to be noted that three large hay warehouses have been destroyed by fire during the past few weeks, which lessens considerably the amount on hand in the various districts, i. e., the King City warehouse with about 2000 tons, the Paso Robles warehouse with about 1400 tons and one of the Pleasanton warehouses with about 2500 tons, a total of practically 6000 tons which has been consumed by fire. The government awarded a contract of 2500 tons for export during the week. Interior demand has been better than for sometime past and hay is being shipped to many points that usually ship to this market. Alfalfa from the River districts is in great demand with very light supply and top quotations have been realized for this commodity. Interior alfalfa, however, is not as desirable at the present time although several large lots have changed hands during the week at prices much lower than for the River product. The straw market is unchanged.

We quote the average wholesale price of hay in carload lots on today's market as follows:

Citrus Fruit Market

LOS ANGELES, Sept. 29, 1915.

Valencias are closing the orange year with remarkably fine prices. The finest of stock of regular sizes commands from \$5.25 to \$6.00 per box delivered. It now appears that before the 31st of October all fruit will be cleaned up, though it may perhaps be the middle of November before it is all disposed of in the Eastern market. The shipment of Navels will begin soon after the first, but they will not go forward in quantity, even from the earliest sections, until about November 15. This will put them in the market ready for the Thanksgiving trade.

Some of the finest lemon sales of the season have been made within the last week. The top notch price, however, has been around \$3.50, with most of the stock selling below that. This is a satisfactory ending of an unsatisfactory season.

Shipments

Shipments of oranges from Southern California points since November 1, 1914, 38,325, lemons 6,660, total 45,085; to same date last year, oranges 43,326, lemons, 2,783, total 46,109. Shipments from Tulare and Butte County points the same as given last week.

NEW YORK, Sept. 27.—Thirteen cars Valencias, two cars lemons sold. Market easier and lower on Valencias, especially sizes 216s and smaller. Market slightly easier on lemons. Weather fair and cool.

TIRE CONDITIONS

Tires, like the engine or other parts of a car, require a reasonable amount of attention and care if the owner expects to secure the best results. There have been many refinements in the construction of tires, and those

built with quality for a base are very dependable; in fact, the motorist ordinarily places so much confidence in the tire equipment, sometimes unconsciously, that the tires do not receive the frequent inspection and attention that is considered necessary for the car.

Should the engine overheat and the bearings burn out, due to lack of lubrication, the result would not be considered an evidence of mechanical error; it would be properly chargeable to oversight and neglect.

It is not always possible to avoid stones and other sharp objects, ruts and severe road conditions, and we shall not attempt to define certain rules or offer impracticable suggestions to be followed in using tires. It is the privilege of the purchaser of a tire to use same according to his own ideas, but we believe that with more information, relative to tire conditions, and with frank, friendly advice regarding the causes, remedies, etc., it will be possible, in many instances, to increase the service and decrease the annoyance and expense. Quality alone, whether it pertains to tires or car, will not insure the greatest efficiency, but a combination of quality and proper care will result in satisfactory service at a low cost of maintenance.

APPLYING TIRES

Before applying tires remove rust and all other foreign matter from rims. If tires have been ridden deflated at any time, mud may have accumulated on rims and unless it is removed the tires cannot seat or fit properly. The danger of pinching inner tubes can be reduced to a minimum by dusting soapstone or powdered mica on the rims so that the tire beads will slip easily into the correct position.

Inflate inner tubes just enough to round them out before placing them inside of cases. Do not use tubes of the wrong size and be sure that the valves are equipped with spreaders adapted to the particular type of cases used. Dust the inside of the case and the inner tube with powdered mica or talc. This will reduce friction and prevent adhesion of tube to case after being heated in service.

When the tires have been removed for any reason it is a good plan when reapplying them, to reverse them, that is, to place the worn sides of the tires toward the car. It is not generally known, though it is a fact, that almost all the side wear on a tire occurs on the side from the car. This is due to road construction, rut wear, curb scraping, etc. The life of a tire may be prolonged to such an extent that a great deal more mileage may be secured by turning the tires about occasionally to secure even wear upon both sides.

SOIL PRODUCTS EXPOSITION

When the complete premium list of the International Soil Products Exposition is received by the prospective exhibitor in Denver September 26-October 10, he is going to be very agreeably surprised at the fine showing of premiums that it will make.

The entire premium list when complete will run about \$15,000 and will comprise many splendid premiums. There will be more cash prizes offered

this year than usual and the cash awards in individual classes have been increased in many instances over those of previous years.

Wheat, perhaps quite naturally, wins some of the best premiums.

For the best bushel of wheat, any variety, the sweepstakes prize is \$300.00 in gold. For the best bushel of hard wheat, the International Harvester Company of America offers a manure spreader, valued at \$125, and for the best bushel of soft wheat the Simplex Spreader Manufacturing Company of Kansas City offers one of its simplex straw spreaders, valued at \$75.00.

TOADS TEN DOLLARS EACH

Loathsome though it may be in appearance, the toad is one of the farmer's best friends. The desire of children and of many men to kill a toad as soon as seen, should be discouraged. The toad lives from 10 to 40 years, and it can lay over a thousand eggs a year. It has lived two years without food, but cannot live long under water. It never takes dead or motionless food. It captures and devours wasps, yellow jackets, ants, beetles, worms, spiders, snails, bugs, grasshoppers, crickets, weevils, caterpillars, moths, etc. In 24 hours the toad consumes enough food to fill its stomach four times. A single toad will in three months devour over 10,000 insects. If every ten of these would have done one cent of damage the toad has saved \$10. The toad is a valuable friend to the farmer, gardener and fruit-grower, and can be made especially useful in the greenhouse, garden and berry patch. Give the toad the freedom of the field!

BRYAN DRIVES TRACTOR

Regarding a recent demonstration of tractors, the Omaha Bee says:

"Col. William Jennings Bryan, he of the silver tongue, cannot only make a success of oratory, but can, if need be, turn his hand profitably to farming. At least he made good at the Fremont tractor demonstration, successfully piloting one of the Bates 'Steel Mule' tractors in a public demonstration. With a Grand De Tour plow attached to the tractor, Mr. Bryan successfully piloted the 'Steel Mule' over a strip of the demonstration field, turning up several furrows as neatly as any plowman who ever turned sod. Everybody was pleased with Mr. Bryan's work and he, himself, was highly elated over his success. Upon finishing his task he alighted from the machine with a beaming countenance, and as H. H. Bates, the inventor, approached, Mr. Bryan said: 'It is very easy to drive it straight. I was very anxious to see how straight a furrow I could make.' And as for Mr. Bates, he says that twisting the tail of his 'Steel Mule' is more certain of good results than can be expected from twisting the tail of the Democratic mule. Mr. Bryan's appearance created considerable interest among the crowds in attendance at the demonstration."

THE COUNTY FAIR

From the U. S. Department of Agriculture comes its latest bulletin containing timely facts and hints regarding county fairs. It is interesting to compare these suggestions with the ideas being carried out by the directors of the Riverside District Fair, to be held in Riverside, October 5th to 9th—next week. The marked success of the past two years of the county fair at Riverside and the strenuous efforts and excellent plans being made this year guarantee genuine profit and pleasure.

Attend the **RIVERSIDE DISTRICT FAIR** October 5-9
The Great County Fair of Southern California at Riverside

All the music of all the world is yours if you own a COLUMBIA GRAFANOLA

Whatever kind of music you like best---grand opera, great overtures; the piano playing of Josef Hofmann; or the violin art of Ysaye.

Or dance music---or Ragtime or brass bands, or something for a laugh---it's at its best on

Columbia *Double-Disc* Records

played on the Columbia Grafonola.

And remember that Columbia Records will play on your machine even if it is not a Columbia Grafonola. Played on any make of instrument, Columbia Records are a tone-revelation to most people: Because the tone of an instrument depends almost as much upon the original recording process in the record making, as on the reproducing mechanism of the instrument itself.

Any Columbia dealer will gladly play over to you the records you want to hear or send a list of records to your home on approval

the Cultivator Poultry Book

Poultry for Profit

by

Jean A. Koethen

PACIFIC POULTRYCRAFT SAYS:

A brand new book on poultry published by that old reliable Cultivator Publishing Co., Los Angeles. The author, Jean A. Koethen, has really written a poultry book worth while. The different subjects are treated with a directness that is refreshing, after reading so many books that say so much and mean so little. The book is intended for the beginner and farmer, but we commend it most heartily to anyone interested in poultry; whether for pleasure or profit; it is full of good things from cover to cover.

THE LOS ANGELES TIMES SAYS:

The author of this manual has covered the subject fully, giving the salient features and practices of an enlightened-poultry culture as it applies to California conditions, based largely on personal experiences, and intelligent compilations from recognized authorities.

THE RIVERSIDE PRESS SAYS:

The Press is in receipt of a copy of this work, called "Poultry for Profit," and has no hesitation in commending it to either the "backlotter" who keeps a few chicks for his own pleasure, to the fancier who works to the "standard," and to the commercial poultryman who makes a business of poultry culture. Before its publication, the manuscript of "Poultry for Profit" was submitted to practical poultrymen, to experts and simple poultry enthusiasts, and all agreed that it was more comprehensive, more readable and vastly more helpful than any similar poultry book yet published. It covers the widest range, discussing breeds, feeds, diseases, housing, marketing and answers the thousand and one questions that even the expert poultryman sometimes has to ask and the amateur is ever asking.

THE PORTLAND OREGONIAN SAYS:

The Weekly Oregonian takes pleasure in recommending this book to its readers, for it is "the right stuff," told in the right way by the right woman.

"Poultry for Profit"

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

An outline of its valuable information—

Making a Beginning	Housing and Yarding	Incubation
Brooding	Feeding	Breeding
Marketing	Sanitation and Hygiene	Fixtures, Conveniences
Diseases and Vices	Ducks and Geese	Turkeys

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe, at the price of one dollar postpaid.

\$1.00 Postpaid to any address.

\$1.75 with the California Cultivator, weekly, one year.

will produce more
milk at less cost
than any other feed.

"—at no time did we ever handle any feed that gave better satisfaction or met with such general favor as Larrowe's Dried Beet Pulp, and we are very glad for having pushed it as hard as we have.

(Signed)

Oregon Commission Co.
Oregon City, Ore."

Your Cows Need This rich, succulent feed, in order to do their best

Dealers everywhere are selling it rapidly, because it "delivers the goods." It makes no difference what ration you may be using—you can add Larrowe's Dried Beet Pulp to it and get better results. This has been proven by large and small feeders everywhere. As it costs almost nothing to make the test, we suggest that you go to your feed dealer today and order a 100-lb. sack (either plain or with molasses) and try it on one cow whose milk record you know. The results will surprise you.

Vol. XLV No. 15

LOS ANGELES: THURSDAY, OCTOBER 7, 1915

One Dollar Yearly

A Million Dollars Worth of Stock on Exhibition

W. S. Guilford Watches the Great Parade of Horses, Ponies, Jacks and Jennies and Writes of the Wonderful Show of Live Stock for Cultivator Readers

ONE of the greatest horse shows ever held is in progress now at the Panama-Pacific International Exposition at San Francisco. This is rather a broad and far-reaching statement, but it was conceded by authorities of international reputation who were in attendance. There have been horse shows with larger entry lists, but none where there was more

quality, none held where the environment so far as grounds and surroundings are concerned was more delightful. The attendance is good and D. O. Lively, chief of the department of live stock, and his lieutenants are entitled to great credit for the pleasing and business-like way in which the show is conducted.

All classes of horses are represented, as is proper for a world's fair

show. There are Percherons, Belgians, Clydesdales, and Shires representing the draft breeds; standard trotters, thoroughbreds (running horses), saddle horses, Morgans, Hackneys, Arabians, Shetland ponies, Welsh ponies, all classes of pleasure and draft horses in harness, hunters, jumpers, polo ponies and police mounts. Then there are many special events, such as hurdle races, jumping contests and

cavalry maneuvers. And last, but not least, is a good show of jacks, jennets and mules.

Nearly \$130,000 in prizes was offered, and entries are on the grounds from all over the United States. The foot-and-mouth quarantine restrictions were not made applicable to the horse show.

Many leading men in the horse industry. Continued on Page 352

Community Cooperation

WELL EQUIPPED COMMUNITY

R. V. Holland.

LITTLE thought on the subject will invariably convince one that the degree of satisfaction we get out of life depends largely upon the conditions prevailing in the community in which we live.

Whatever advantages the community affords we enjoy, while to whatever extent the locality is deficient or poor in public utilities and opportunities, we who make up its population are circumscribed in life's pleasures and comforts.

Theirs are the most satisfying lives who live in a well equipped community and who go to make up a congenial neighborhood. It goes without saying that a prosperous population is almost a contented, happy population.

One of this country's greatest financiers made the statement a few years ago that one of the prime reasons for the increasing cost of living was the lack of well directed effort on the part of small-town community people. He went on to explain that lack of cooperative effort on the part of people living in small towns naturally resulted in an impoverished community, one in which life becomes a burden rather than a pleasure. It is from localities and conditions of this kind that the large cities draw their myriads of young men and women, boys and girls.

For most of us a community must have a minimum equipment, strong church advantages, good schools, good roads, easy communication

with the outside world and adequate shopping and marketing facilities. These essentials make possible the many other elements necessary to a prosperous neighborhood.

The above mentioned advantages are all community institutions and can only be secured and maintained through the cooperation of people in the community.

'Tis an old saying, but true enough to repeat, that an individual gets out of the community no more than he or she puts into it. Selfishness is, therefore, the most effective bar to our happiness. Each of us should and must be willing for every other person in our community to enjoy some of the fruits of our individual labor and sacrifice: we receive in return, however, the benefit of our labor and sacrifice multiplied by the number of cooperating neighbors we have. Thus by each contributing our share of labor, money or patronage we share in the general benefits and advantages resulting from the united effort of all of us.

No person is apt to look upon schools, churches, parks, pavements, etc., as commercial. We rather consider them as institutions better off if kept out of commercial and political influence. However, we must remember at all times that these advantages are to a large extent made possible and maintained by the business interests of the community of which the retail store is a dominant factor. Consequently, the prosperity of local retail merchants has much effect upon these community blessings and it therefore is to our best interests to patronize local stores whenever possible.

Your home merchants are an inextricable part of community life. They can serve you to as good advantage as anyone else anywhere, and it is to your interest in dollars and cents to trade with them, all things being equal.

Some Notes on the Walnut

Leonard Coates Writes for Cultivator Readers of Some of the Certainties and Uncertainties of Walnut Culture. Varieties, Budding or Grafting, Stocks, Propagation, Pruning and Other Points Touched Upon

PINIONS as to the successful culture of the walnut are exceedingly varied, and it is this divergence of opinion which causes many persons to hesitate before planting a walnut orchard. With the existing facts, however, it is no longer necessary to regard walnut culture as prone to more uncertainties or vicissitudes than any other fruit tree crop.

The earlier practice was to grow trees as seedlings, and the orchards thus raised produced nuts of all types and grades. By selection, these types were improved, until, in Southern California, some of these seedlings became so near to yielding a nut which met the market requirements as standard, and were grafted from, to insure exact perpetuation of the variety. Of these, perhaps, the most prominent is the Placencia Perfection, which is now grown commercially on a very large scale and is the variety which has done so much towards the permanent establishment of the industry in California.

The walnut blight, which affects, more or less, all of the varieties of this strain, caused growers to endeavor to find a walnut which was resistant to this disease, while possessing the necessary market qualifications. To this end several seedlings have been produced which possess greater hardiness and which are claimed to be immune to the blight.

As materially assisting in this disease resistance, it was found to be necessary to discover or originate varieties which did not start growth too early in the season, the young growth in early spring, during changeable climatic conditions, being easily susceptible to the blight.

The same trouble had affected the walnut in Europe, and imported varieties of the walnut are now being grown both South and North.

The varieties of walnut of which Placencia Perfection is typical, do not succeed north of Tehachapi; this is conclusive. Therefore the French varieties or their seedlings are the only ones considered in Northern California. In the South, some of these French varieties do not meet with approval, so that, in the broad question of variety, we are yet somewhat in the experimental stage. For this reason, and to avoid being partial, it is almost impossible to suggest the best varieties for Southern California. In the North, where the industry is comparatively small at present, only the French varieties or their seedlings have any chance of success. Of these the Mayette, Franquette, Chaberte, Parisienne, are types. The Mayette type stands at the head, as illustrating the true Grenoble walnut. The qualifications of a walnut are size, which should be medium rather than too large; shape, roundish, somewhat flattened at base; soft shell, but not

soft enough to break during harvesting or marketing, and with well-closed ends; plump kernel, with white or very light-colored skin; good flavor. It might also be added that the color of the shell should be a bright, light brown, and not the dull, dead color of some otherwise good nuts.

Walnuts were formerly all on their own roots, which is still the practice in Europe. It has been found that in California the native black walnut generally makes the best stock. The Eastern black walnut is a good stock in very moist soils, and the English, or "own root" often makes a better tree under these conditions than the native species. Several hybrids are used, and with varying success. Instances of abnormal growth always imply unusually favorable conditions. Nothing is better than a selected seedling of the California black walnut as a stock under the average existing conditions.

Propagation is done by grafting and budding. The latter has not been widely successful, although in our own grounds we get 90 per cent to 95 per cent stand with buds, either on large or small stocks. We bud twice in the year, in June, with buds of previous season's growth, and in September, with those of current season. There are many details in both the preparation of buds and stocks which are essential to success which could

not be explained in a brief article, and even then, practice and patience can alone make perfect.

It has generally been stated that the walnut requires no pruning, and, still further, that the tree is injured if pruned. Both postulates are wrong, and are, supposedly, on the assumption that the walnut, unlike any other commercial fruit tree, should be allowed to grow as a timber tree, naturally, and without restraint. With this idea in view the walnut is planted 50x50 or 60x60 feet apart, or only about a dozen trees to an acre. Is this a profitable commercial proposition for the man who plants the trees?

A very large walnut tree bears only on the outside, or extremities of branches; it is practically impossible to spray it, and harvesting the crop is an expensive undertaking. Walnut trees may be planted 25x30 or 40 feet apart, be kept pruned for a few years, have a great abundance of fruit spurs close in on the main limbs, and be a very profitable crop within ten years. A future owner, in another decade, may take out some of the least productive trees, leaving more room for those that require it. This is not mere theory; walnut orchards on both of these plans are in bearing in the state.

This may be enlarged upon at a future date, with photographs illustrating the different methods.

The Man in the Multitude

That the human voice may be transmitted across our continent by telephone is the marvel of this age of wonders. Yet the full significance of the achievement is not realized if it is considered strictly as a coast-to-coast connection.

The Transcontinental Line not only bridges the country from east to west, but, by having finally overcome the great barrier of distance, it has removed the last limitation of telephone communication between all the people of the nation.

This means that the voice can be sent not only from New York to San Francisco, but from *anywhere* to *anywhere*—even from *any one* to *any one*—in the United States.

Wherever you are, it is possible to reach any one of our hundred million population. You can single out from this vast throng any particular individual with whom you desire to speak.

To bring this about, the Bell System has spent years and millions, extending its lines everywhere, anticipating the ultimate triumph. It has had the foresight and the courage to unite this great country, community by community, into one telephone neighborhood.

With the Transcontinental Line in successful operation, the established Bell highways make you the near neighbor of your farthest-away fellow citizen.

Citrus and Tropical Fruits

THERMOMETERS

By Madison Cooper in Cold.

THE word thermometer is of Greek derivation and means a measure for heat. This instrument is constructed on the well known principle that heat expands all bodies.

For his first instrument Fahrenheit used alcohol. But before long he became convinced that a more suitable article to use in the glass tube was semi-solid mercury. The basis of Fahrenheit's plan was this: To mark on the tube the two points respectively at which water is congealed and boiled, and graduate the space between. He commenced with an arbitrary marking, beginning with 32 degrees, because he found that the mercury descended 32 degrees before coming to what he thought the extreme cold resulting from a mixture of ice, water and sal ammoniac.

Thermometer Scales Compared

Below will be found a diagram with the thermometer scales in common use compared. The Fahrenheit scale is used most exclusively in America, while the Reaumur and Centigrade scales are in common use in foreign countries. The freezing and boiling points of each are made to show the figure used at these points, and thus a rough comparison may be made.

C.	F.	R.
10	50.0	8.0
9	48.2	7.2
8	46.4	6.4
7	44.6	5.8
6°	42.8°	4.8°
5	41.0	4.0
4	39.2	3.2
3	37.4	2.4
2	35.6	1.6
1	33.8	0.8
zero	32.0	zero
-1	30.2	-0.8
2	28.4	1.6
3	26.6	2.4
4	24.8	3.2
5	23.0	4.0
6	21.2	4.8
7	19.4	5.6
8	17.6	6.4
9	15.8	7.2
10	14.0	8.0
11	12.2	8.8
12	10.4	9.6
13	8.6	10.4
14	6.8	11.2
15	5.0	12.0
16	3.2	12.8
17	1.4	13.6
18	0.4	14.4
19	2.2	15.2

Conversion of Thermometer Degrees

°C to °R multiply by 4 and divide by 5.

°C to °F multiply by 9, divide by 5, then add 32.

°R to °C multiply by 5 and divide by 4.

°R to °F multiply by 9, divide by 4, then add 32.

°F to °R, first subtract 32, then multiply by 4 and divide by 9.

°F to °C, first subtract 32, then multiply by 5 and divide by 9.

On the Fahrenheit thermometer the freezing point is 32 degrees above zero, while on the Centigrade thermometer the freezing point is at zero. The size of the degree on the Fahrenheit instrument is smaller than on the Centigrade, the boiling point of water being represented by 212 degrees on the former as compared with 100 on the latter. Thus it will be seen that on the Centigrade thermometer the difference between the freezing and boiling points is 100 degrees, while on the Fahrenheit thermometer it is 180 degrees, or the difference between 32 and 212.

A Fahrenheit degree is only five-ninths of a Centigrade degree and accordingly a degree of the latter is nine-fifths or one and four-fifths times the size of a Fahrenheit degree.

In working out the temperature in terms of the Centigrade thermometer,

assuming that the Fahrenheit thermometer registered 32 degrees below zero, it would be necessary to add the 32 degrees below zero to the 32 de-

grees above zero, because the freezing point starts at 32, and the sum would be 64 degrees. As a Fahrenheit degree is only five-ninths the size of a Centigrade degree 64 should be divided by nine, giving a result of 7.11 which multiplied by five, would give 35.55, the number of degrees below zero on the Centigrade thermometer.

CITRUS TREES

It doesn't pay to take chances

FLORIDA CITRUS CROP

The Grower representative talked with growers this week from every shipping center as to the size of the coming citrus crop, and the consensus of opinion seemed to be that as a whole it would be shorter than last year; oranges slightly less, grapefruit not much over 50 per cent.

Manager Bateman, of the DeSoto County Exchange, stated that there would be more oranges at Wauchula, Fort Ogden and Punta Gorda than last year, but that in the big producing district of Arcadia the crop would fall off some, and that, taken as a whole, he expected the orange crop would be about the same as last season. There would be an especially heavy crop of tangerines, though DeSoto County does not produce many of this variety. Grapefruit would be about 50 per cent of a crop. Asked if the Exchange would ship more this year from this county than last season, Mr. Bateman, with a twinkle in his eye, said, "Oh, about 700 per cent more." This statement is not far wrong, for much work has been done in DeSoto County this past season, and instead of the output being 60,000 boxes it will be over 400,000 boxes.

According to Director Stewart, of Volusia, oranges will be in excess of last season in some districts, notably Lake Helen, Emporia and Crescent City, but there will be less in DeLand and Orange City. There will probably be at least as many oranges. Tangerines will be in big supply; grapefruit about 60 per cent of a crop. The Exchange expects to add about 20 per cent to its holdings as compared with last season.

Manatee crop is very short all around and instead of 500,000 boxes, there will hardly be over 250,000 boxes shipped from the county. Manatee produces more grapefruit than oranges and this in some measure will account for the great falling off. The Exchange will have an increased acreage and membership, but will probably ship less fruit on account of the shortage. Manager Gumprecht states that a meeting will be held at Miakka on the 22nd of this month to put the growers right on the crop situation. He states that he has heard that growers were selling citrus fruit as low as 30 cents a box on the trees.

Orange County will very nearly have as many oranges this year as last, but grapefruit is considerably less all over the county. Even with less fruit in the county the Exchange will handle more fruit this year, though this is largely on account of the fact that the Orange Sub-Exchange will handle the fruit shipped through Kissimmee in Osceola County. So states L. W. Tilden.

There is a very good orange crop in the territory of the Indian River Sub-Exchange, which extends from New Smyrna to Vero along the East Coast, though grapefruit will be very light. According to Director H. G. Putnam, this sub will handle very nearly as much fruit as a year ago. He states that with one good season he believes that a great majority of the Indian River fruit would come into the Exchange fold. Last year was bad and out of six associations but three stuck, though others are being formed to take their places.

Director Ed Parkinson says that the orange crop of Lee County is "pretty good," as heavy as last year, while grapefruit will be short at least 50 per cent.

Manager Walker, of Polk, says that there will be about 90 per cent of an orange crop and about 60 per cent in grapefruit. The total crop of Polk County last year was about 900,000 boxes, of which the Exchange handled 75 per cent, and about this percentage will be shipped this coming season.

Manager Martin states that the Hillsboro orange crop is "spotted," some sections reporting a heavy crop, while others are to the effect that the output will be small as compared with last season. He states that this also applies to Pasco and Hernando Counties. He believes on the whole that oranges will not be much less than normal, but that grapefruit will be not over 40 per cent.

Lake County will be some short on both oranges and grapefruit, particularly the latter. The Exchange is making gains in this county.—Florida Grower.

BANISH ROBBER FRUIT TREE

Get rid of the orchard tree that doesn't earn its own keep!

And the way to do this is to keep a record of the yield of every individual tree, and to re-bud from a high-yielding tree the tree which fails to pay its way. Thus, just as the dairyman who keeps a record of the butter-fat production of each of his cows can eliminate the "boarder cow" who produces less than the value of what she eats, so the orchardist can eliminate the fruit tree which fails to pay fair rent for the ground it occupies.

Such is the text of a sermon preached by Verne W. Hoffman, a student in the college of agriculture, in an article on "Individual Tree Performance Records" in the September number of the University of California Journal of Agriculture, a magazine published monthly by the agricultural students.

Hoffman tells here the interesting story of how Mr. A. D. Shamel of the United States Department of Agriculture, a government expert who makes his headquarters at the university's citrus experiment station at Riverside, induced the management of a great citrus orchard near Corona, to keep records of the individual yield of 65,000 orange and lemon trees. Use of this system for three or four years has proved how practical and profitable it is on a commercial basis.

Every tree in this orchard has a number painted upon it. Each tree is picked separately, the fruit weighed, and the record entered in a permanent record book.

These records soon showed that one out of four of all the lemon trees in the orchard failed to pay their way. Examination was made to see if the low yield was due to bad soil conditions, gophers, or gum disease. If no such excuse could be found for the tree, then it was rebudded with a bud from a tree whose records had proved it to yield a high crop and a good type of fruit. The first 2500 trees rebudded all without exception came up to the desired standard, and 2000 more have now been flagged for rebudding.

Hoffman reports that Mr. Shamel's experiments show that an unproductive tree can be changed, by top-working, into a good producer. Three years after being rebudded, one lemon tree produced 329 pounds of lemons (during the half-year ending June 30, 1915); that is, about seven field boxes, a good average for the ordinary high-producing tree of ten or twelve years.

So the day is coming when the lazy fruit tree will be as promptly detected as the lazy cow who fails to earn her own living. A lazy fruit-tree, like a lazy cow, uses as much land and feed and requires as much labor and care as the highly-productive tree or the highly-productive cow.

These valuable lessons of more prosperity for the farmer and more food for the consumer are to be made much of during the Farmer's Short Courses in General Agriculture, Dairy Manufactures, Horticulture, and Poultry Husbandry, for practical farmers and their wives, at the University Farm at Davis from October 4 to November 12.

HOW HE GOT EVEN

A busy housewife came into the sitting room with a determined look in her eyes.

"I really shall have to punish those children," she began.

"What have the little beggars been up to now?" asked the father, looking up from his newspaper.

"Why, they've made a mess of my sewing room," explained the wife. "Needles, reels of cotton, scissors—everything has been hidden away in the most unexpected places. It is really exasperating."

Her husband laid down his paper and smiled benignly.

"I did that," he said, calmly. Then, in answer to a questioning look, he went on. "You tidied up my desk so beautifully the other day that I thought it only fair to return the compliment. So I tidied up your sewing room."—From the Pittsburgh Chronicle-Telegraph.

International Harvester Wagons—Weber—Columbus

THERE are a few points about the new Columbus and Weber wagons that every farmer ought to know. These points make the difference between Columbus and Weber wagons and others—a difference that means a good deal to you.

The fifth wheel, that prevents the pulling up and pitching of the bolster, makes it easier for your team to pull a Columbus or Weber wagon and does away with bent and broken king pins and circle irons. The patent folding endgate and the link end rods save much of your time in the busy season. The high-grade wood, iron, steel and paint used add years to the life of Columbus and Weber wagons. These things mean economy.

These points are explained in detail in our wagon folders and are pictured so plainly that it's almost like looking at the wagon itself. Some dealer near you handles these wagons and has samples set up for you to see. Drop us a line and we'll send you the booklets and folders. We'll also tell you where you can see a Columbus or Weber wagon so you won't have to waste any time looking for it. Write to us today.

Deciduous Fruits

AN APPLE RANCH AND ITS DEVELOPMENT

By Vida French, Sebastopol, Before State Fruit Growers' Convention.

In determining the location of an apple orchard one should carefully consider the following factors: soil, nearness to available labor, site, exposure, air currents and water.

The soils preferable for apples are clay loams, moderately heavy clay and rich gravelly loams with limestone subsoil. The character of the subsoil is very important, particularly if near the surface. Apples must have a deep root system to protect them from winds and drouth. The contour of the subsoil does not always follow the contour of the surface. The water table should be four to six feet from the surface. An apple tree cannot live with wet feet because root development can't take place without air. Avoid heavy black muck like prairie soil, as trees run too much to leaf and are short-lived on soil of this character.

In determining the exposure, if there is danger from frosts a northern slope is best, then a northeastern or a northwestern. In sections with high drying winds the exposure should be away from the prevailing winds. If there is little danger from late frosts, a southern or southeastern exposure is desirable for high color and earliness of ripening. Never plant an orchard in a pocket, but be sure of good air drainage. The ideal site would be a tract of land slightly elevated above the surrounding country, as air currents are an important factor in the prevention of disease. There are five basic plans for laying out orchards; the square or rectangular system, the triangular or hexagonal, the alternate, the quincunx, and the contour. The first two are used most often. In the hexagonal system all the trees are equally distant apart, thus giving room for 15 per cent more trees per acre than the square system and affording three directions for cultivating instead of two.

In staking an orchard very accurate results may be obtained with a planting wire and range poles, though we used a triangle as well, which was 25 feet on a side with rings at the angles large enough to slip over a stake. To be sure of setting the tree in the exact place staked planting boards should be used.

Now we come to the selection of trees for planting. The choice of the individual plant is very important, particularly with the commercial orchard where the same body of wood is carried throughout the life of the tree. Many people make the mistake of rejecting plants which do not come up to some imaginary standard of their own. Be sure your ideal conforms to the variety and don't try to make a variety conform to your original ideal. The tree should first of all be healthy and a strong grower. It should be carefully examined for any signs of disease or insect pests. A certificate of inspection in the nursery by the horticultural inspector is not enough. Plant one-year-old trees. They transplant better, the head may be pruned to any height desired, and they can be given a better form because not so likely to have been spoiled in the nursery row. The age of a tree is reckoned from the time of budding or grafting.

When your trees have arrived from the nursery don't leave them in the shipper's package but heel them in by digging a trench and laying them in it at an angle and then covering the roots with earth. Don't leave large bundles of trees tied together. Heeling-in is to prevent the roots from drying out. If the roots of a tree dry out its chances for starting again are very small. Heeling-in also supplies the tops with moisture. The tops of the trees should point south so as to protect the trunk from sun scald.

As to varieties, choose those best

adapted to your locality and market. If you ship wholesale have as few varieties as possible, but if you retail in small quantities then it is desirable to have a succession of fruit throughout the season.

When it comes to the planting don't be afraid of digging a large hole. The size of hole will depend upon the character of soil, size of root system, and depth. The heavier the soil the larger the hole must be. This is to loosen up the soil so an extended root system will be possible. The hole should be plenty large enough so that the roots won't have to be cut off. Never make the size of the hole a pretext for cutting off the roots. Plant from one to three inches deeper than in the nursery row and about 25 feet apart. In pruning the roots remove as little of the root system as possible. Cut off all bruised or damaged roots and make the cut at an angle to the axis of the root and not perpendicular to it, as when at an angle there is less chance for air spaces between the root and the soil, hence less likelihood of the cut portion drying out. The cut should be on the under side of the root.

Exposure of the roots at any time is very bad. Keep a wet sack over the bundles of trees when carrying them from hole to hole and never let the sun strike them. It is advisable to distribute the roots evenly around the tree, as a greater soil area is thus obtained and the tree is assured a support in heavy winds. When filling in the hole, if the subsoil is hard and lumpy, then save surface soil for the roots. When the hole is partly filled tramp the earth firmly about the roots, then mound the earth up about the tree to provide for settling, or water will stand on the roots. On the surface the soil must be left loose.

Never set a tree straight; slant the tree towards the prevailing winds. In the south trees are often slanted towards the south to prevent sunscald. In setting trees on a hillside the tree should slant uphill, for the wash on the slope tends to push it down the other way.

Watering newly-set trees is to be discouraged. A tree as received from the nursery is entirely out of balance. To equalize the top and bottom reduce the top to correspond with the loss of roots. The pruning done will depend on the kind and age of the tree. It may be pruned to a whip or pruned to a spur. In pruning one-year-old trees we always prune to a whip and start the head about 18 to 20 inches from the ground. The second year remove all but three branches and have these well distributed around the trunk. Each summer about June we go over the young trees and pinch back to stubs all growth not desired as framework. In from one to two years these stubs will form fruit spurs. The main pruning, however, should be done in the winter or early spring. As a rule, cut back only the past season's growth. If more than this is taken off, the tree will never have a good shape, since branches have started out on the two-year-old growth.

Pruning requires more personal thought than any other factor of orchard management. A plant is not an individual, but a colony of individuals made up of many units. Each bud and branch is competing with every other bud and branch in the struggle for existence. Pruning eliminates competition and thus saves energy.

The objects of pruning are to increase the vigor of the tree; to increase the size, amount and quality of the fruit; to remove worthless and deleterious parts; to change the habit of the tree from wood to fruit production; to facilitate orchard operations by thinning; and to train the tree to the desired form.

The general principles of pruning may be stated as follows:

Heavy top pruning increases the amount of wood growth, because the

equilibrium of the plant is destroyed. The food gathering area is the same, while the food-consuming area is decreased. To make up this deficiency an increased growth results. Prune weak growers heavily and too vigorous growers sparingly.

Root pruning reduces the vegetative growth.

Heading-in thickens and broadens the top.

Winter pruning tends to produce wood.

Summer pruning tends to produce fruit.

Overstimulated trees can be brought into bearing by summer pruning. This is exhaustive to the plant, however, because the leaves removed have not yet returned to the tree as much nourishment as they have taken out. Summer pruning should not be practiced for more than three years in succession.

We practice the clean culture or tillage system as everyone must in California. We plow twice, the first time about ten inches deep with a two-horse plow and the second time with a gang about six inches deep. We cultivate the orchards with a two-horse riding cultivator and harrow after every rain. After the rains have ceased the bearing orchards are harrowed every two weeks until the props are up, and the young orchard is cultivated all through the growing season and hand hoed three times.

There are three objects in tillage: First, it improves the mechanical condition of the soil; second, it conserves moisture, and third, it renders plant food more available.

Cover crops should be sown in the fall to plow under the following spring. This is the cheapest way to keep up the supply of humus. A cover crop hastens the maturity of wood in the fall; prevents root killing and washing of the soil by rains; it lessens evaporation in winter, increases the water holding capacity of the soil and improves the tilth. Rye and Canada field peas make a good combination sown broadcast at the rate of 2½ bushels per acre.

The fertilizing elements required by an orchard are nitrogen, potash, phosphoric acid and lime. The nitrogen increases leaf and stem growth, thus reducing fruit production. Fruit

The Best and Cheapest Way to

Control Scale and Fungus

on Citrus Trees is to spray with

Citrus Zeno

(The Standard Tree Spray)

Because

It kills the scale as thoroughly as fumigation.

It destroys the black fungus (which fumigation is not even expected to do.)

It cleans and renovates the tree. It is not a caustic material. It is easy to mix and apply. It is a proven material.

It is being used by many of the largest and most progressive growers. We operate under state license.

We can show you. And all this for one half the cost of fumigation.

Citrus Zeno sold in 50-gal. bbls. at \$14.00 per bbl., f. o. b., Los Angeles.

For summer and fall spraying dilute at the rate of 1 gal. Citrus Zeno to 30 gals. water.

doesn't color up well when there is too much nitrogen in the soil. Potash is the most important element after trees come into bearing. It composes about 50 per cent of the ash of fruit and serves as the base for fruit acids, hence if potash is lacking the flavor isn't good, as fruit acids can't be formed. It also serves as a check to too much nitrogen and gives color to the fruit. Phosphoric acid is less important than the other two, being not nearly so essential to a fruit crop as to a cereal crop. It is necessary for the proper ripening of fruit. It enters into seed production and shortens the growing period as potash does.

Lime is more important to fruit than to other crops. It strengthens the growth of the tree, giving a better and stronger framework. It shortens the growing period and has a very marked influence in heightening the color. Fruit is the highest colored in lime-

stone soils. Lime has an indirect benefit in improving the mechanical condition of the soil.

One should not fertilize newly set trees, for they are not in a condition to avail themselves of large amounts of available food because the root system has been shattered. If the root system is in condition to use the available food it will not extend itself and the life of the tree will be jeopardized if fertilized when set out.

Spraying the young orchard should not be neglected. For the first two years we found it more economical to apply lime-sulfur with a paint brush than by the spray nozzle. This kept the trees free from scale and prevented injury from rabbits. One summer spraying with kerosene emulsion for aphids and perhaps one spraying for powdery mildew with atomic sulfur has been all that was necessary to keep the trees clean and thrifty.

THE AVOCADO AND THE BABCOCK TEST

Written for California Cultivator
By J. Eliot Coit.

Within the last year a great many complete chemical analyses of avocados have been made. A number of these were reported in bulletin 254 of the University of California experiment station. Recently many additional analyses have been made. It has been shown that there is a very great variation in the oil or fat con-

tent of fruit of different varieties or seedlings. While the protein content shows some variation also it is a fact that the greatest food value of the avocado is due to its fat content.

Complete analyses require considerable labor and expense as well as the services of a chemist, and some simple and cheap method of testing the fruit for fat which might be used by the growers themselves is much to be desired.

In thinking this matter over it occurs to the writer that the Babcock test, which is universally used by dairymen for determining the percentage of butter fat in milk, cream, and cheese, might be adapted for use in testing avocados. Accordingly, a series of experiments was performed, the results proving quite satisfactory. At first the same Babcock equipment, size of sample and strength and acid commonly used in soft cheese tests was tried out. It was found that 17.5 cubic centimeters of acid was not quite sufficient to dissolve all the cellulose. When this was increased to 19 cubic centimeters the solution of light matter was complete and the column of fat could be measured accurately to one half of one per cent. There are a few minor matters of technique to be experimented with before the test is standardized and directions printed.

It ought to be possible to have these tests made at any dairy or creamery by any one familiar with milk testing, and when run in series they need not cost more than from 25 to 40 cents each. A small hand tester may be bought for six or eight dollars and by following directions any farmer may easily make the tests himself just as the dairy farmer tests his milk occasionally to keep check on the creamery.

There are cow testing associations all over California and why may we not have an avocado tree testing association with prizes offered for the seedling testing the highest percentage of fat? At any rate the idea is suggestive and will be followed up and a report made at the avocado growers' association meeting in Los Angeles in October.

Cochise and Santa Cruz Counties, Arizona, A. L. Paschall, Adviser, San Simon.

Seed selection, fall and winter preparation of soil, and poultry will be the main subjects for discussion and demonstration for this month.

One of the main requirements for successful farming in Cochise and Santa Cruz Counties is the proper planting and cultivation of adapted, acclimated crops. All of our cultivated field crops can be greatly improved in quality and yield by systematic seed selection. We should select and breed up pure strains of seeds on a community basis.

The Lawn and

Flower Garden

THIS MONTH IN SOUTHERN CALIFORNIA

Written for California Cultivator
By O. M. Morris.

GARDEN work this month will consist principally in renovating garden and planting bulbs. Old bulb beds should be thoroughly raked up and if possible a new mulch of manure spread over them and thoroughly watered down. This will apply to all of the hardier classes of bulbs such as daffodils, or any of the narcissi, tulips, Spanish iris and the like. All new planting may be made immediately.

Two of the most popular bulbs in Los Angeles and vicinity are the daffodil and Spanish iris. These two classes have proven very hardy and once planted last for years without any particular care and are always sure bloomers. Among the popular varieties of daffodils of good color, large flowers and long stems, probably the Emperor stands at the head, with Sir Watkins and Empress close seconds. In Spanish iris nearly everyone has his preference as to shades, but for blue Cornflower and Blue Flag are the most popular varieties. In yellows Cajanus and William the Second are the best. While these are by all odds the best liked one may have nearly any shade in this flower from white through the different markings of blue, and blue and yellow, lavender, etc.

For border plants the zephyranthus has an evergreen growth and blooms throughout the summer and early fall. In fact, it is considered one of the constant bloomers. It has grass-like foliage and is highly recommended. Friesias, oxalis and sporaxis are also serviceable but their blooming period is short.

The Cottage and May Flowering Darwin tulips are all very satisfactory in this climate. The early flowering being too restless to come into bloom make very short stems and are practically worthless in our warm climate while the late flowering classes all do well. Undoubtedly the best scarlet is

the long-stemmed Gesneriana. These have strong, stiff stems, frequently two feet in length. There are many good varieties of these and, as with the tulip, one may choose most any shade, including dark crimson, pink to pure white, yellow, buff and chocolate brown.

Hyacinths are more difficult to handle and if grown in pots should be set in shade for a couple of months and then brought to the light and given plenty of water. They may be grown in the open ground with good results if the bulbs are planted about three inches deep and the ground mulched over with straw or litter to a depth of two or three inches more. Keep the bulbs cool and hold them back as much as possible until they make strong growths.

Good hardy bulbs of gladiolus can be planted for early blooming. The gladiolus is adapted to all seasons' planting. Planted in succession one may obtain flowers practically throughout the entire year.

There is a large list of the smaller class of bulbs which may be planted at this season.

Summer flowering lilies such as the Easter lily and the Japanese lily may be planted. The sooner they are planted the earlier will they bloom in the spring and summer. If planted out in the ground they should be set from six to eight inches deep. Get them away from the surface and they will last for a number of years and thrive. If set close to the surface earth worms and insects soon get the best of them. Some of these bulbs are better if planted a foot deep. Our native lilies such as Humboldt should go down in the ground at least one foot and it is best to put a small shovel of leaf mould around the bulb, especially if the soil is heavy.

In the regular flower garden the calendar for last month will still hold good. Pansies and stocks for early winter flowering should go in at once, also winter flowering sweet peas. In another 30 days the summer-flowering variety of sweet peas should be planted.

Small Fruits

Vegetables

THIS MONTH IN SOUTHERN CALIFORNIA

Written for California Cultivator
By O. M. Morris.

ALL hardy vegetables such as turnips, beets, carrots, radish, lettuce, chard, kale, kohlrabi, Brussels sprouts, endive, cabbage and cauliflower can be planted during October. As a winter crop turnips, beets and carrots are splendid field crops for stock should a market be lacking for them. Large plantings of these may be made at this time with perfect safety.

If sure of a market cabbage is a good crop to grow during the winter months. Earlier varieties will mature in about five months. The best are Winningstadt and Cannon Ball.

In protected places where winter frosts are not too severe one may reasonably expect good success with peas. For such locations we would also recommend small plantings of Canadian beans providing they are planted at once. These may be injured somewhat by early frosts, but as a rule will set beans in due time, and though they may lose their foliage the beans may be held on the vines until the holiday season when they will bring good prices. There is always a

scarcity on the market of curly and red cabbage. The same is true of Brussels sprouts and kohlrabi. The sprouts have proven especially profitable where they grow well.

CORN EAR WORM

THE pest of worms which has infested ears of corn has been most perplexing to the gardener and to the grower of field corn. This worm is hatched from eggs laid by an adult moth which is both a day and night flier. The moth is about an inch long and her eggs are a yellowish white. The larva is a most repulsive worm

which is sometimes two inches long, yellowish to brownish in color with longitudinal gray and white stripes. After the depositing of the eggs on the silk end of the ear of corn the "worm" hatches and eats its way into the tip of the ear. Sometimes these worms destroy almost the entire ear. The pest is not exclusively one of corn, however, for it takes tomatoes, eating holes into the bottom or sides and causing decay. It also works in the South upon the cotton bolls and is there known as the boll worm. Other food plants of the worm are alfalfa, beans, cabbage, geraniums, gladiolus, grapes, malva, okra, many of the fruits, pumpkins, squash, etc. The usual remedy given for this pest is to plant a larger crop than it is desired to harvest in the hope that the excess rows of corn may save the remainder of the crop from attack. Spraying has not been entirely successful but we were recently shown a field of green corn in the experiment grounds of the German Seed and Plant Company at Montebello, Los Angeles County, in which about three-fourths of the rows had been treated in an effort to control this pest. The remainder of the rows had not been treated and in going through the field and plucking many ears in the part which had not been treated we found in more than a dozen ears only one which was not attacked by the worm. In the larger portion of the field which had been treated with a high grade arsenate of lead more than 90 per cent of the ears were free from attack. To us it was a remarkable showing of control of a pest which is usually considered beyond control. The treatment consisted of placing dry arsenate of lead without any dilution in bellows and blowing the material over the ear of corn when the formation of silk was first discovered. This treatment was repeated some three times at a total cost per acre of less than \$5, practically nothing compared to the benefits received. Other experiments which have been tried of placing the dry arsenate of lead in sacks made of light muslin or cheesecloth and shaking over the ears show results almost identical with those in which the arsenate was blown over the corn with a bellows. We trust this experiment will be repeated by many corn growers with next spring's crops. If the moth does deposit its egg on the outer part of the husk and the larva must eat its way in through the husk then there is a fighting chance, and certainly this method could not be simplified for the veriest novice can hardly err in application of the remedy.

To give more exact information we have later received more definite figures: Out of 218 dusted ears there were 197 free of infestation and 21 wormy. This is 90.3 per cent free.

From 150 of the untreated ears there were eleven with no worms and 139 wormy or only 7.33 per cent clear. Visalia, 92½.

Prize-Winning School

The awards of the 1915 Beautifying Committee to high schools in Class No. 1, were: Inglewood, first (\$400); Covina, second, (\$200); Venice, third, (\$100); and Montebello, fourth, (\$75). All these were planned by Ernest Brauntun. A full set of plans and specifications were furnished the first, second and fourth; and the third was advised how best to compete, during a visit to the grounds.

Among the other prize winners Ernest Brauntun was official adviser to the following: Santa Monica High School; Grant and Garfield Schools, Santa Monica; Central School, Redondo Beach; Central School, Venice; Lawndale; and Zelzah.

Let him plan your parks, school grounds, and residential sites. Country Home Grounds a specialty.

Ernest Brauntun

237 Franklin St. Los Angeles

Choice Two Year Old Rose Plants

Mr. Mitting, an expert horticulturist, says: "I would rather plant out two plants of roses two years old than twelve small rose plants from two inch pots."

We offer the following roses, all summer bloomers, at special prices: Kaiserin Augusta Victoria, white, 30c; Madame Caroline Testout, pink, 35c; Ulrich Brunner, red, thornless, 50c; Killarney, pink, 35c; Madame Ravary, yellow, 25c; Mrs. Aaron Ward, Indian yellow, copper and gold, new, 50c; Duchess of Albany, red, 35c; Frau Karl Druschki, white, 40c; Perle von Godesburg, lemon yellow, 30c; La France, 25c; Antoine Revire, pink, tinted with yellow, 40c; La Detroit, pink, shading to soft rose, 40c.

The above twelve beautiful roses, two years old, three feet high, bushy, with roots, sent by express PREPAID, for \$3.00.

Climbing Roses

American Pillow, pink, single flowers, 4 inches across, 30c; American Beauty, pink, 30c; Madame Caroline Testout, pink, 40c; Meteor, red, 25c; My Maryland, glowing pink, 40c; Hiawatha, Hybrid Wichuriana, 35c.

The above six climbing roses, three feet high, heavy bushes, with heavy roots, sent prepaid for only \$1.50.

Berrydale Gardens, Box 685, San Jose, Cal.

COMING EVENTS

MOST vitally important is the month yet to come at the great exposition at San Francisco. This may seem a broad declaration in face of the many important conventions that have taken place there and of the number of noted diplomats and statesmen, who have brought their views to the visiting world at this greatest of international expositions. But it is agriculture that makes a country. Without it a nation is nil. The boundless resources of the United States of America are what have made her today supreme in the financial realm. Her climate, her soil, her waterways, her railroads have made her a land of plenty and abundance.

October, therefore, which is to be farmer's month at the exposition, will stand above all the other months as a period which will live in the commercial annals of the world, for agriculturists and stockmen of all nations will meet to view the product of efficient husbandry and to discuss the ways and means by which the efficiency was achieved.

The month began on the afternoon of September 30, which was opening day for the great horse show. See Mr. Guilford's account of this on leader page of this issue. During this month and November there will be 55 big agricultural and live stock conventions. Most of these come in connection with the live stock shows. We have given the dates of these conventions before, but in order that they may be before our readers we repeat:

Horses, mules and asses, September 30-October 13; cattle, beef and dairy, October 18-November 1; sheep, goats, and swine, November 3-November 15; car lots of live stock, November 11-November 14; poultry and pigeons, November 18-November 28; dogs, cats and pet stock, November 29-December 1; children's pets, December 1-3.

The American Shire Association people have finished their sessions; the American Automobile Association is now in session. The California Conference of Boys' and Girls' Agricultural Clubs occurs on the 16th; the American Forester's on the 18th; Western Forestry and Conservation Association on the 19th and 20th; California State Grange Patrons of Husbandry, 19-20; American Forestry Association on the 20th; Ayreshire Breeders' Association on the 20th; American Shorthorn Breeders' Association, October 22; American Aberdeen-Angus Association October 25; Red Polled Cattle Club of America, October 26; Polled Durham Breeders' Association, October 26; California Creamery Operators' Association, October 28-30.

Secretary Darst of the American Milch Goat Record Association writes that the eleventh annual meeting of the association will be held in Congress Hall, Panama-Pacific Exposition grounds, at 2 p. m., Wednesday, November 3, 1915. All are cordially invited to be present.

With the closing date of the exposition less than two months away there are still 115 conventions and congresses scheduled.

Closing Date of the Panama-Pacific Exposition at San Francisco December 4.

More than 50 live stock and poultry associations will gather at the exposition for conventions, exhibitions and competitions during the latter half of

October. Thousands of horse, cattle, sheep, swine, poultry and pet stock fanciers and breeders will gather to display their choicest products and to hold conferences which will cover all phases of animal industry.

October is said to be the finest month in the year so far as climate is concerned in San Francisco. Be sure and see the exhibits of everyone who carries announcements on this page. We have seen them and we know they are educational.

Do not miss hearing the Philippine Constabulary Band. There are 90 musicians in this great organization.

The aeroplane stunts are still thrillers, especially at the moment when the birdman takes a drop straight for the earth.

ENTRIES AT P. P. I. E.

Superintendent T. E. Quissenberry writes regarding preparations for the great exhibit at the Panama-Pacific poultry show. He calls special attention to the need for poultry people to remember that all entries will close on October 15 and that there will be no promiscuous sending out of entry blanks, but he advises everyone who may wish to exhibit to write at once for these blanks. In his "last call" he says:

"Remember that the entries for the Panama-Pacific Poultry Show close on Friday, October 15. If you haven't time to write for entry blanks, phone or wire the variety, the sex and the number of each, and we will gladly reserve space for your birds. Send your entries today for it is dangerous to delay. Entry blanks will only be sent out on request so don't wait for them to be sent you. They should be postmarked not later than October 15. It is not at all necessary to select the individual birds until the date of shipment. For example, if you have two cockerels and you are in doubt as to which to enter, select a new band and enter a cockerel under that number. Then when you are ready to ship place that band on the cockerel and your cockerel's number will correspond with our books and with your original entry. It is absolutely necessary for you to send the name of the variety and give the sex and band number of each at the time of entry, but you can hold these bands and place them on your birds at the time of shipment. Be sure to keep a copy of your entry blank and get the correct band numbers on the right birds. If you haven't an entry blank send in an entry on your own letterhead. Give your name and address, the variety, the sex and the band numbers to correspond. A blank will be filled out for you and shipping tags sent. The entry fee to pay the cost of feeding, watering, cooping, handling and caring for birds is \$1.50 per single bird, \$4.00 per pen of one male and four females, and \$7.50 for large display cages large enough to hold 10 or 12 birds."

As to express rates he suggests that by shipping light wooden coops it is possible to get from ten to 12 fowls in each 100-pound shipment. The round trip express rates for each 100 pounds to San Francisco and return from New York is \$20.80, other eastern towns running about the same or possibly slightly less. Kansas City running \$17.10. The round trip rate from Los Angeles per 100 pounds is \$5.20, Seattle

\$8.30, with an additional 50 cents per 100 for delivery at exposition grounds.

Superintendent Quissenberry urges that Poultrymen's Day, November 16, be observed by every poultryman of the country. One of the most valuable competitions will be in the utility or egg type classes.

A well known expert has been engaged to judge the utility poultry. He will give demonstrations each day in judging and selecting the laying hen. An entry fee of 50 cents per bird will be charged in this class for either male or female, but these birds are not entered in the exhibition class. The exposition will give first, second, third, fourth and fifth certificates or ribbons in the following classes: Best egg types in every variety of the Mediterranean classes; best egg types in all other classes; best dual purpose types in all other classes; best meat types in all other classes.

PREMIUMS

There should be a fine showing of all kinds of live stock drawn by the liberal premiums which are divided as follows:

Cattle show, \$93,000 in premiums; sheep and swine, \$50,000 each in premiums; poultry and pigeons, \$25,000 in premiums; dogs, cats, pet stock and children's pets, \$10,000 in premiums. The competitions will be judged by 130 leading breeders and live stock experts of America.

The Bloomington Fruit Association in San Bernardino County, has elected the following officers: President, Lon F. Chapin; vice president, G. Leiser; secretary-treasurer, D. C. Swartz; assistant secretary, Geo. O. Complin; manager, A. G. Burch.

\$1.00 a
union
suit

Here's wonderful money's worth for 50c!

Men! Here's a soft, smooth, elastic winter underwear that will warm you, wear you, fit you, and save you half your underwear money! Besides all this, "Hanes" underwear has an *elastic collar* that fits the neck snugly, *improved cuffs* that hug the wrist closely, *form-fitting anklets* that can't stretch loose, and *unbreakable seams* that are guaranteed not to rip.

GUARANTEE

We guarantee Hanes Underwear absolutely—every thread, stitch and button. We guarantee to return your money or give you a new garment if any seam breaks.

Warning to the Trade

Any garment offered as "Hanes" is a substitute unless it bears the "Hanes" label.

ELASTIC KNIT
UNDERWEAR

You never saw such value for the money—nor better underwear at any price. How can we do it? Because we buy the finest cotton direct from the growers and spin our own yarn; because we specialize on just this one grade of men's underwear.

Look up the "Hanes" dealer in your town. If you don't know who he is, write to us and we'll tell you. Insist on "Hanes." There are no others "just as good."

P. H. HANES KNITTING COMPANY, Winston-Salem, N. C.

The Tenth Year of Cumnock Academy Opens September 28

Parents who are planning to have their daughters enter the school this year should consult immediately in regard to registration. Call, telephone or write for complete information.

Cumnock Academy

is an accredited school, its graduates being admitted to the better universities and colleges without examination. Two courses are offered—college preparatory and general. Carefully chosen faculty, whose work is supplemented by special courses given by the CUMNOCK EXPRESSION SCHOOL faculty.

A sub-preparatory department, offering the seventh and eighth grade subjects, is also maintained.

Cumnock Academy occupies beautiful buildings and grounds in a charming, retired location. All outdoor sports—gymnasium, basketball, tennis, horseback riding. Limited number of boarding students. Write for catalogue.

CUMNOCK SCHOOL OF EXPRESSION

Twenty-second Year Begins Oct. 4

All phases of Literary Interpretation—Story Telling, the Dramatic Art, Public Speaking, Art Appreciation. Write for Catalogue.

REMEDIES FOR FLEAS

Of the approximately 400 species of fleas known to exist the human flea, the dog flea, the cat flea, the rat flea, which carries the plague, and the sticktight flea are the varieties which most commonly affect human beings and domestic animals. The sticktight flea differs from the others in that when it has once attached itself to a host it remains with its mouth parts immovably imbedded in the flesh. Chickens suffer in particular from this pest and for this reason it is sometimes called the chicken flea. It is frequently seen in dense masses also on the ears of dogs and cats. It is difficult to loosen it from its hold, and its destruction therefore presents some difficulties. Fairly good results are obtained from the local application of kerosene and lard in the proportions of one part kerosene and three parts lard, but if used too freely this may injure poultry.

In the case of other species the insects hop about much more freely and may or may not, therefore, be found at any given time on their hosts. When dogs or cats, however, are found to be suffering, a bath in a three per cent solution of creolin will probably be found to be effective. A sufficiently accurate method of making such a solution is to add four tablespoons of creolin to each gallon of water. Warm water should be used and the animal placed in a tub with the solution in it. A stiff brush should then be used to work the solution into the hair, particular care being taken to wet the fleas on the head of the animal. The bath should last five or ten minutes, after which the creolin should be rinsed off and the animal washed with warm water and soap. This treatment is desirable for cats and will prevent the skin of the most delicate animal from being burned. Finely pulverized moth balls worked into the fur of the cat are also useful. The naphthalene in the moth balls drives the fleas out of the hair. They emerge in a stupefied condition and can then easily be killed. Insect powder, sometimes called pyrethrum, buhach, or Dalmatian insect powder, may be used in the same way. Fresh, unadulterated pyrethrum is necessary to secure satisfactory results.

It is useless to attack the adult flea if no attention is paid to its breeding places. The flea may lay its eggs upon the host animal, but in the case of the human flea most of the eggs are probably deposited while the insects are in their nests somewhere in the vicinity. In houses the cracks of floors or under matting or carpets are favorite places. The conditions under buildings are often favorable for breeding. For this reason it is desirable that dwellings, stables and sheds should be so arranged that cats, dogs, chickens and other animals that harbor the pests cannot go beneath them to sleep. Dirt floors in chicken houses and sheds furnish more favorable conditions than wooden floors, and young fleas are often found in the straw, feathers, and waste in such places. Where chicken houses and sheds are found to be infested the manure should be hauled away and spread in fields. Unnecessary rubbish and dry animal matter should be piled up and burned. The ground, the floors of outhouses, and similar places where the breeding is supposed to occur should be sprayed with kerosene or crude petroleum sprinkled about. An inexpensive preventive measure is the liberal use of salt scattered about the breeding places and then wet down. Semi-weekly thorough wettings with water have been found to keep fleas out of poultry runs in Texas and salt water from the Gulf is used extensively for this purpose along the coast.

Where it is supposed that dogs or cats are largely responsible for the infestation it is desirable to compel them to sleep in a definite place in order that the eggs from the fleas be concentrated and thus more easily destroyed. A few gunny sacks or a mat for infested animals to sleep upon will be found to contain a great majority of the eggs and these can be destroyed by shaking the cloths over the fire or exposing them on a bare spot to the rays of the sun.

Where fleas are found to be breeding in the house itself the first step is to sweep up all the dust and burn it. Floor coverings should be removed, aired, and beaten, and the floor scrubbed with strong soap suds. Various insecticides have also been found to be effective, but many of these are either dangerous to health or injurious to various articles.

Fumigation with sulphur fumes or hydrocyanic-acid gas has also been employed to rid dwellings of fleas. Both of these have the additional advantage of killing rats and mice as well as fleas but sulphur is open to the objection that it corrodes metal and injures plants. Hydrocyanic-acid gas is so deadly that its use except under expert direction is quite out of the question. In fumigating with sulphur four pounds to each 1,000 cubic feet of space should be used. The sulphur is piled up cone shaped in a pan, which is placed in a larger pan or tub of water to avoid fire from the heat generated. A depression is made in the top of the cone of sulphur, a little alcohol poured into it, and a match applied. The room to be fumigated should be tightly closed beforehand and kept closed from 10 to 12 hours. At the end of that time the doors and windows should be opened from the outside and the room thoroughly aired before it is entered.

THE "PICKING UP" HABIT

Written for California Cultivator
By Sacramento Valley Contributor

An empty second-hand grain sack may be worth a nickel, five cents, or it may be worth only three cents. There is a great difference in the treatment these old sacks are accorded on different farms. On some they are carefully picked up and put away, and every one is admonished to bring them in from the fields or wherever they may be used or found, and there is always a supply of them in their proper place for whatever use they may be desired.

On other farms the idea seems to prevail that so small a matter as a five or three-cent sack is too trivial to pay any attention to, but if old grain sacks and all manner of other things are left around a place everything is slovenly and unkempt and there must be many, many little wastes that in the aggregate amount to a goodly sum in a term of years.

To have a neat, well kept place every one who has to do with it must be impressed with the necessity of never passing by the things that litter up the premises without picking up the stick or sack or can or piece of iron that is where it should not be, and put it where it should be.

There must be some one to lead in the good work, however, and whoever this may be he must not be disappointed if it seems at times that he is picking up for the whole outfit, but he must keep on, and gradually every one will get the habit.

Her Husband—Not in this apartment, love.—Judge.

Economics on the Farm

RURAL CREDIT POSSIBILITIES

THOUGH "Rural Credits" sounds, as do many other catch words, quite attractive, there are certain things to consider before voting about them.

If the actual farmer, or would-be farmer, is to have money loaned him below market value, why should not the merchant, the miner, and the mechanic all enjoy the same privilege?

Where can the state obtain any "cheap money" to loan to farmers except by taxing its citizens therefor?

Will there not be a tendency to increase the number of farm mortgages if money can be obtained by farmers below current rates?

If the farmer, for example, can borrow money on mortgage at 3 per cent and lend it at 5 or 6 per cent, would not he be a fool if he did not borrow?

If he could not get 6 per cent in California, could he not invest in foreign securities at 6 per cent, and would that not eventuate in reducing capital in this state?

Do you know that Argentine tried a similar proposition, issuing land bonds, or cedulas; four series of which ran down to as low as 8 cents on the dollar, and had close relation with the world panic of 1893?

Lastly, after all this fine-sounding talk of bringing "the landless man and manless land together," is it not a fact that, in many lines of production the grower finds it very difficult to make his annual expenses because of the low price of produce and high cost of labor? Why then invite increased production?

I asked W. Niels Nielsen of Australia, at a public meeting, if the method of rural credits prevailing there had caused an exodus from the cities to the farming lands; and I received no assurance that even there the landless man was over eager to work the manless land!—Edward Berwick.

* * *

We would not presume to answer all of Mr. Berwick's questions, but as each one is entitled to his own opinion we at least give ours on one or two of the points raised.

Beginning with Mr. Berwick's "lastly," we will agree that the "grower does find it very difficult to make his annual expenses because of the low price of products and high cost of labor" but think Mr. Berwick should have added "and capital." The high cost of capital has been even more embarrassing to the producer than has the high cost of labor, and Mr. Berwick would hold that cost up.

But going to the first of Mr. Berwick's questions as to why the merchant and the miner and the mechanic should not enjoy the same privilege, we note Mr. Berwick is very careful not to refer to the banker. So may we ask: Why should any of these producers of our nation be compelled to pay for the use of his capital three, four and five times as much as do the bankers? Our nation, our state, and many of the counties are loaning money to banks at one and a half and two per cent. Why are these producers deprived of this same privilege? We presume Mr. Berwick will say: "But the bankers give ample security for this money which they borrow." Then we ask of him, "Should it not be made possible for the farmer to give a security which will be ample and which will enable him to do business on as reasonable a basis as the large handlers of money?" The trouble is in this matter of finance, it is born in our people to look at the rights of the extremely wealthy as sacred and to feel that the common people should not aspire to any such rights. We are glad to say some of us are awakening to our needs and to our rights and will demand them. California has millions of dollars to loan. If she does not capitalists do have and will loan through our state just as they did the \$5,000,000 which was

needed by the state to encourage a great exposition. It is within the province of this same state to so secure that which will enable her farmers to properly equip their farms. It has been shown that not one-half of the farms of America are today equipped with labor-saving appliances. In other words, our produce is costing the farmer so much that he is unable to make a profit. Until he is financed this excessive cost will continue.

As to the next question, "Will there not be a tendency to increase the number of farm mortgages?" We cannot say. We think, and we sincerely hope, there would be, and for the reason above given that too many of our farmers are now under-capitalized and illy equipped. We grant that in the eyes of many the word "mortgage" expresses something most terrible, but with the knowledge that practically no nation nor great business enterprise is financed without credit and that if there were no business done in this

world except by those with the coin in their hands, there would be more hungry people than there are today. The shiftless or the careless farmer who makes up the season's losses, caused perhaps by his own shiftlessness, by mortgaging his farm, or possibly the one who places a mortgage in order to secure money for a wild-cat scheme or for pleasure, has perhaps given just cause for this feeling that a mortgage is to the discredit of the mortgagor. But it is so well known that some of our most successful farmers are doing business with borrowed capital that there is no reason for the blind prejudice against the word "mortgage."

As to the farmer borrowing at such an exceptionally low rate of interest that he will be tempted to turn around and buy foreign securities at a high rate of interest, "we should worry!"

As to the Argentine failure, frankly we do not know.

Neither do we anticipate that American believers in justice to the producers of the country will devise a scheme which will result disastrously. There have been too many rural credit institutions which have secured reasonable rates to the producers and which have succeeded that it is not necessary to found such an institution on principles which lead to failure. There is no call for philanthropy. There is need, still more, there is

necessity, that the food products of this country shall be produced at a low cost, and Mr. Berwick is the last who should oppose such a movement. —Editor.

DRESSING FOR WOODWORK

While at the Panama-Pacific exposition we noted the natural and consequently beautiful appearance of the woodwork in the Lumbermen's Building, south of the Palace of Horticulture. Asking the attendant regarding the dressing which was used on this woodwork he gave us the following treatment: "The woodwork should be thoroughly cleaned and sandpapered, then apply two coats of a solution composed of four parts white beeswax, one part carnauba wax (from Brazilian wax palm) and 15 quarts of turpentine, thoroughly rubbed after each coat."

On a farm where live stock is kept greater attention must be paid to cleanliness than on one on which there is no live stock. This is particularly true of a dairy farm for the success of which thorough sanitation is a necessity.

PRETTY BLUE

Saplee—What is this Blue Bird we hear so much about?

Snappleigh—The Dove of Peace.—Judge.

What Happened to That Bump?

We saw it—were braced for the shock—and nothing happened! Over the obstruction we went as if on wings. This surprise comes to all who first ride in a Mitchell. Later you get accustomed to the fact that all roads are smoothed out under the tremendous swing of this new "Mitchell SIX of '16."

One enthusiast on Mitchell *comfort* says the overwhelming success of this new car is due to its easy riding qualities. This is the first car built in which the passengers in the rear seat ride as comfortably as the driver.

Another ascribes it to the Mitchell *action*—the quick getaway, the instant stop. Other owners enthuse over Mitchell *appearance*: long, symmetrical lines suggesting power and poise.

The Mitchell is the greatest car value ever offered. It answers the demands of all the family: style and easy riding for the "women folk," speed and "snap" for the boys; and the long life and strenuous service which all practical needs demand. This all-around usefulness accounts for the fact that "every 'SIX of '16' car sells another."

See the Mitchell dealer near you. He has this new "SIX of '16" at your disposal for a trial spin. Get the personal touch.

Entered at the Post Office at Los An-
geles, California, as Second-Class Matter.**Thursday, Oct. 7, 1915****OUR ADVERTISERS RELIABLE**We guarantee our subscribers against
loss through dishonesty of any adver-
tiser in the Cultivator. We do not at-
tempt, however, to adjust trifling differ-
ences between subscribers and honest,
responsible advertisers, nor will we pay
the debts of honest bankrupts. Notice
of complaint must be sent us within 30
days from date of the transaction, and
the subscriber must have mentioned the
Cultivator when writing the advertiser.**SHORT COURSES**

S This week starts the farmers
short courses at Davis. The equipment
of university farm at Davis is turned
over to farmers of all ages, and not
only the equipment, but the best tal-
ent of the university is at the service
of the farmers who are attending. The
courses continue until the middle of
November.

STATE FAIR

S The state agricultural society is
sending out announcements for the
state fair for 1916. The management
gave way as to the 1915 fair and urged
all exhibitors to center on the great
exposition. Now for 1916 and the big-
gest fair ever. Strength to the arm of
the management and may it be more
than ever a pure agricultural fair. We
appeal for a reduction in vaudeville
stunts so far as possible.

SOME POMP

S An Eastern farm paper is com-
plaining because "Solomon in all
his glory was never arrayed in the
fullness of the pomposity that
accompanies some of the state
governors in their triumphal march
to the Panama Exposition," and then
asks, "Who pays for all this dis-
play?" We may inform our con-
temporary that it will probably pay
its share as will the other taxpayers.
However, it is worth the price, for
California is putting up two great ex-
positions, and the Eastern governors
especially need some of the education
which California can give this year.

FEIJOS

F The comparatively new fruit,
feijoa sellowiana, is now ripening as it
has been for some seasons in various
sections of the state. A Los Angeles
daily paper has referred to "the first

ripe fruit" as being produced this year
in this state. This report in turn has
been quoted by a fruit journal. Hence
a subscriber suggests that we make
correction and call attention to the
fact that this luscious fruit has been
ripening here for many years. Better
than all, it has proved itself capable
of withstanding low temperatures.
During the cold weather of 1913 but
little injury was done to it.

WALNUT PRICES

W The new prices named by the
Walnut Growers' Association are given
on market page. It will be seen that
Number Ones have been fixed at 13.6
cents per pound. This is nearly three
cents under last year's prices, and we
presume, as with the almond situation
in the north, non-members of the asso-
ciation will criticize. However, those
handling the affairs of the association
have looked into all the marketing
conditions so far as possible and we
believe have done wisely. The asso-
ciation controls practically three-
fourths of the nuts in California.

ROW OUR CWN

G There has been a great deal
of talk about dyestuffs and other
things which have been supplied
to this country by other nations.
The manufacturers have been com-
plaining bitierly because of the
loss of these imports due to the
war. Consequently there is much talk
about producing our own. As a mere
hint, may we bring up the matter of
sugar beet seed?

We have depended upon Europe en-
tirely for our supply. When Califor-
nia's perfect conditions for producing
sugar beet seed are considered we be-
lieve it is pertinent to ask, "Why do
we not produce our own?"

SAN DIEGO'S EXPOSITION

S The San Diego exposition is
drawing a remarkably fine attendance.
It has now been in operation for over
ten months. The visitors in that time
have numbered well up towards 2,000-
000. The daily average for Septem-
ber was something less than 6,000.
Compared with great world's exposi-
tions this is not large, however, this
is the exposition of the Southwest. We
have come in contact with many peo-
ple who have been there, and almost
invariably has come from their lips, "It
is the handsomest little exposition
ever." Its full year will be up on the
evening of December 31, and it should
be visited by everyone who can pos-
sibly arrange to go.

PEST NUMBER

P Scarcely a mail comes to the
Cultivator office without some parcel
containing an insect or fungus infested
leaf, stem or tuber, with the appeal
"What is it and what can we do for
it?"

It has been the custom of this paper
to issue at least every two years a
special number giving methods of
handling all of these pests. It will be
issued this year on Thursday, Novem-
ber 4. This time is chosen because of
the appeals coming to us for help to
prevent peach blight and similar trou-
bles. Peach blight is a serious pest in
California. The issue in question will
give methods of handling it. The first
treatment should be during the last of
the month of November or the early
part of December. This one issue will
be worth a year's subscription price
and should be filed for future refer-
ence.

OUR COVER

O The opening nuts shown on the
cover page of this issue of the Culti-
vator are typical of the season. Also
they afford an opportunity to call the
attention of our readers to our cover
scheme. The new cover has, by the
way, received many compliments rang-
ing all the way from "classy" down, or
up as the case may be, to "exceptional-
ly fine." The Cultivator's improved
appearance is not all due, however, to
the design on the cover but to the
paper stock on which it is now being
printed. We have called attention to
it before, but hope our friends will par-
don us for again referring to it.

The new year is coming and during
it we wish our family to grow larger
than ever. This is the subscription
period and we suggest to our subscrib-
ers that the word be passed along to
their neighbors as to the worth of the
California Cultivator. We hope to
make it better than it has ever been.
Its motto will still be, "By the farmer,
for the farmer." In other words, we
wish to secure and will secure from
the most practical men in California
points which will help to make Cali-
fornia farming more profitable.

As always, we will stand by cooper-
ation. We hope to aid in securing
rural credits and to advance recogni-
tion of the need for better marketing
methods. To that end we ask that
all of our subscribers join us in a cam-
paign for better class goods which
shall always be maintained at the
same high standard.

Again we say, pass the good word
along. If you have criticism, pass the
word to us and we will endeavor to
merit the friendship of our patrons,
and make more complete "The Cali-
fornia Cultivator Covers California."

RURAL CREDIT

R We have received most hearty
commendation of the position taken on
this page last week on rural credits,
especially with reference to the
ground taken by Dr. Elwood Mead and
ex-Ambassador Herrick. We do not
like the terms, "state aid" and "fed-
eral aid," but we do believe fully in
the state or nation giving what is
usually termed "aid" in financing the
farmers. Again, we hardly like the
term "financing" for it bears the sug-
gestion of philanthropy. It is not, or
should not be, such; it is merely a
matter of supplying capital for farm-
ing operations on a just basis—which
has not in the past been the case.

To illustrate this point we wish to
refer to an editorial in the Cultivator
of February 11, 1915. In that we de-
scribed the incident of a farmer en-
deavoring to secure \$1500 on his
ranch. We quoted literally from a let-
ter written him by a financial concern
which proposed to make the loan,
"The interest in your section is not
less than ten per cent and the cost of
securing the loan would be at least
five per cent." In addition it was de-
manded that the borrower pay 25 dol-
lars "legal" for making the examina-
tion. This would make the first year's
interest practically 17 per cent. No
farmer or other business man can live
under such charges. There must be
liberation from such conditions and if
the October 26 election does not make
a step towards relief in this matter
we will be greatly disappointed.

To the end that our readers may be
somewhat informed next week's Cul-
tivator will give "Reasons for Better
Methods of Land Settlement and
Lower Interest Rates for Farmers" by
Dr. Elwood Mead of our state uni-
versity.

Agricultural Notes

The first car of grapefruit received
in New York from the Isle of Pines
came through on August 26. Much of
it was too green.

The Potato Association of America
will hold its annual meeting at Grand
Rapids, Michigan, December 1, 2 and
3. In connection the Michigan State
Potato Association will also hold ses-
sions.

An impetus has been given to the
construction of sugar factories and re-
fineries in Cuba. Heavy investments
are being made with the expectation of
establishing American and European
markets.

More than 240 new game laws were
enacted in the various states of the
Union during 1915. In only three
states, Arizona, Georgia and Nebraska
were existing laws allowed to stand
unchanged.

The coming sugar crop on the
French West India island of Gaudeloupe
is promising. Vice Consul J. O.
Florandin, however, reports a prob-
able shortage of labor, as most of the
men are recruited for the French
army. The coffee, cacao, and vanilla
crop prospects are also bright in
Guadeloupe.

Australian wool growers are antici-
pating high prices and a good selling
center for the next clip. The last
year's clip showed a shrinkage of over
20 per cent, owing to drouth and other
adverse conditions. The coming sea-
son's clip will show a great scarcity of
lamb's wool. The present season's
clip is already beginning to appear at
the market center.

The Chinese government has un-
dertaken to open an exposition of
home products in Peking on October
10, 1915. While domestic articles will
be of first importance, the new Chi-
nese commercial and industrial com-
mission has been endeavoring to get
foreign firms also to make exhibits
which would show to the Chinese the
advance made by other countries in
commercial and industrial enterprises.

Consul Wakefield at Port Elizabeth,
South Africa, reports that a serious
condition confronts the ostrich indus-
try of Africa. At one time highest
grade feathers commanded the record
price of \$550 per pound and fancy
breeding birds sold at \$10,000 per pair.
Prices have been depressed and im-
mense stocks have been accumulated
from recent plucking. The prices at
present are the lowest they have ever
been and are about as follows: Good
grade, unsorted wing feathers range
from \$14.50 to \$19.50; low grade, un-
sorted wings, \$6 to \$12; tails, \$1.20 to
\$3.10; body feathers, 75 cents to \$2.50.
It should be remembered that the
prices quoted are for unsorted parcels
only.

Sugar has proved a big money
maker for Peru the last year. In the
world-wide commercial crisis that fol-
lowed the outbreak of the European
war, it has been the principal support
by which Peru has maintained its eco-
nomic position on a fairly satisfactory
basis. The war had an ill effect upon
nearly all South American industries,
but the producers of sugar reaped a
profitable harvest. Peruvian sugar,
which was quoted at \$2.50 per quintal
of 112 pounds in January, 1914, sold
at \$4.86 per quintal after the declara-
tion of war, an increase of 90 per cent
in value. Great Britain was the prin-
cipal buyer of Peruvian sugar in the
past year, with the United States a
close second.

Agricultural News Notes

of the Pacific Coast

Northern California

Yolo County's output of hops will be fully up to normal.

The Leghorns maintain their lead in the egg-laying contest at the exposition.

Fifteen dollars per ton is the top price for wine grapes at Healdsburg, Sonoma County.

The Almond Growers' Association of Yuba City reports a most successful harvesting season.

From Colfax, Placer County, 75 refrigerator carloads of Bartlett pears have been shipped.

A large party of Napa County dairymen visited the Timms Certified Dairy near Dixon recently.

Hopgrowers of Sonoma County have received to date in excess of \$200,000 for this season's crop.

Chico, Butte County, will produce about 2500 tons of prunes. The packing season began last week.

Woodland, Yolo County, Stock Farm is shipping some fast horses to compete in the races at Salem, Oregon.

The farm bureau of Alameda County has been securing waste lime from the Alvarado sugar factory for use on heavy soils.

The farmers' short courses started at the university farm at Davis on the fourth of this month and will continue until November 12.

Poultrymen are pleased at the high prices to which eggs are being marked. Record prices of the year were made last week.

A modern dairy plant is to be established on what is known as the county poor farm property in Alturas, Modoc County. This land is now owned by C. A. Estes.

The California Wine Association is defendant in a suit for fulfillment of contracts involving \$5,000,000. Suit is brought by growers whose contracts have been abrogated.

Wine grape growers near Geyserville, Sonoma County, are protesting at treatment of growers this year by the California Wine Association and are selling to independents.

Marysville is planning for a rice carnival to be held the week beginning Monday, October 25. In connection with the carnival there will be a poultry show and products' exposition.

Woodland, Yolo County, reports that practically none of the new crop of hops has been sold. The few sales that have been made were at 12 cents per pound, and were merely deliveries under early contracts.

Farmers of the Glenn County farm bureau have been getting together necessary data to show where grades, ditches and road culverts are needed, and a committee has been named to present these needs of the county to the board of supervisors.

Farm bureau members in Placer County are clubbing orders for nursery stock, alfalfa, hay, seeds, and lime in order to secure the best goods at low prices in good season for use. Local lime deposits are being investigated as a possible source of cheap lime for farm use.

Central California

Nearly 3000 acres of orchard will be planted near Hanford, Kings County.

Tulare County's squirrel bounty is causing a terrific slaughter of the squirrel pest.

Oakdale, Stanislaus County, made one shipment of 15 cars of fine fat cattle last week.

The South San Joaquin County Community Fair is being held at Manteca October 8 and 9.

Raisin men have been concerned at threatening and rainy weather during the drying season.

Earlimart, Tulare County, reports the biggest alfalfa crop of the season now being harvested.

Over 200 acres of timber and pasture land were laid waste in the forest fire near Salinas last week.

Plans are being made for the reorganization of the Pajaro Valley Orchardists' Association.

Ranchers and business men of Merced County are now asking for appointment of a farm adviser.

Olive growers of Lindsay, Tulare County, have decided to unite with the California Ripe Olive Association.

Kings County's prune crop will return a half million dollars to growers this year if present prices are maintained.

Ranchers of Deer Creek, Tulare County, are protesting against the formation of the Terra Bella Irrigation District.

It has been suggested that this should be considered grape week when everyone should spread the gospel of healthfulness of California fresh grapes.

Wine grape growers of the San Joaquin valley will unite in a suit against the California Wine Association because of alleged failure to keep contract.

Salinas is making an effort to secure a fund to send the winner in the agricultural contest of the Salinas Union high school bean growing contest to Washington.

Farmers of Santa Cruz and San Benito Counties are making a special effort to secure better roadbeds and to that end have arranged for a good road holiday.

Oakhurst, Madera County, on September 27 held the Mountain Farm Bureau Fair. The produce exhibited was all grown in the mountain sections of the county.

A systematic campaign of education on the eradication of hog cholera in Stanislaus County is being prosecuted by Farm Adviser Connor and Dr. Cady of the state university.

A grain conference was held at Stockton on September 15 by farm advisers from nearby counties to consider the feasibility of shipping grain in bulk rather than in sack. At this conference were present also representatives of railroads, milling companies, and grain buyers. The conference disclosed the fact that California is the only large territory in the United States that still sacks grain.

Southern California

The Rialto Heights Citrus Association has accepted plans for a new packing house.

Riverside anticipates the extension of her beautiful Magnolia avenue to the mountains.

Ventura County has an animal quarantine ordinance which became effective September 15.

There is a possibility of a compromise in the Riverside County-San Bernardino County water suit.

The Fullerton-Placentia Walnut Association packing house opened to receive walnuts on September 20.

Imperial Valley is harvesting its date crop. The majority of the dates now in bearing are of the Deglet Noor variety.

The Walnut Growers' Association of Chino held its annual election last Saturday. The association has 153 members.

Santa Barbara County finds so many violations of the speed laws that she is urging rigid enforcement of speed regulations.

Members of the San Diego County Cow Testing Association report themselves greatly pleased with the first month's testing.

The Tri-Counties Reforestation Committee met at Orange County Park last week. Special consideration was given to the Newlands bill.

Olive growers of Southern California held a meeting in the Los Angeles chamber of commerce rooms last Saturday to discuss marketing problems.

The San Diego Museum Association has been organized for the purpose of preserving some of the more important buildings at the Panama-California Exposition.

Imperial Valley will celebrate tomorrow, October 1st, as "Collar Day." It has been a misdemeanor for the past four months to wear a collar in the Imperial Valley.

Calexico has eight gins, each with a capacity of 500 bales of cotton daily. El Centro has two gins, Seeley two, Holtville two, Imperial two, Brawley one and Calipatria one. The crop throughout the valley is heavy.

Packing houses of the Walnut Growers' Association are busy places. It is estimated the tonnage will be somewhat lower than early reports indicated. The filling of cartons is all done at the packing house in Los Angeles.

The Riverside County Chamber of Commerce held a session with farmers and fruit growers of the Beaumont and Banning sections of the county last week. This organization is endeavoring to secure more general cooperation on the part of producers of the county.

An immense shipment of hogs from the Middle West to Imperial Valley has been held up because of quarantine regulations by State Veterinarian Keane. This shipment is referred to by the Brawley News as a ten-train hog special and regret is expressed that the feeders cannot be brought into the valley for finishing.

The Coast

Portland, Oregon, reports receipts of many cars of Oregon crop of onions.

Montana's harvesting has been seriously interfered with by heavy rains.

An agricultural fair will be held at Casa Grande, Arizona, November 8-10.

The potato crop of Asotin County, Washington, is about two-thirds of normal.

Lettuce is becoming one of the largest crops of the section around Yuma, Arizona.

The fall round-up of live stock is occupying the attention of Arizona stockmen.

There will be an Indian Fair on the Pima reservation at Sacaton, Arizona, late in this month.

Apple growers of the Northwest estimate that their 1916 crop will be double that of this year.

A sale of purebred Holstein cattle was recently made at Spokane, 100 head commanding \$26,000.

One seed concern at Yuma, Arizona, has recleaned 62,000 pounds of alfalfa seed of this season's growth.

Broom-corn growers in the Chandler district of Arizona have asked for lower freight rates to the coast.

Nine cars of Spokane apples were recently purchased by the Harvey eating house system of the Santa Fe.

Morrison Brothers of Chandler, Arizona, last week shipped \$2000 worth of ostrich feathers to New York.

Farmers of Navajo and Apache Counties in Arizona are moving to secure the appointment of a farm adviser.

The Utah State Fair Association has announced prizes for the milk and cream contest to be held during the fair.

A cow testing association has been formed at McMinnville, Oregon. This is the twelfth association in Yamhill County.

Utah beet growers are receiving seeds for the coming season's planting from Russia through Finland and Sweden.

"See Arizona First" has been chosen as the slogan of the Arizona state fair, which will be held at Phoenix, November 15-20.

The Chandler cotton gin is in full operation. Cotton is now selling at 20 cents with the prospect of better prices in the near future.

Washington and Adams Counties in Idaho, and territory along the Snake River in Oregon, held a three-day fair at Weiser, Idaho, September 29-30 and October 1.

Water users of the Salt River Valley Association recently met and protested against certain practices of the board of governors and demanded return of fees which the users declared to be excessive.

The county farm demonstrator recently featured an excursion from Provo, Utah, to another section of the same county. The afternoon was spent in examining farm equipment and operations.

ALL OUR SILOS, TANKS AND PIPE ARE DESIGNED BY ENGINEERS TO MEET EVERY CONDITION. MADE IN OUR BIG FACTORY FROM CLEAR, AIR DRIED REDWOOD. SELECTED FROM A STOCK OF 40 MILLION FEET WHICH WE CARRY AT ALL TIMES.

SILOS
BUILT FOR YOUR PARTICULAR NEEDS. EXACTLY AS YOU WANT THEM. ALL SIZES AND DIMENSIONS.
15x36 REDWOOD STAVE SILO MANUFACTURED BY US FOR THE PANAMA-PACIFIC INTER-NATIONAL EXPOSITION, SAN FRANCISCO, 1915

TANKS
BUILT TO ORDER TO SUIT ALL USES AND USERS. CHEAPER THAN METAL TANKS. LAST LONGER. WON'T RUST. CAN BE TAKEN DOWN AND RE-ERECTED WITHOUT DAMAGE. CAPACITIES, 500 TO 500,000 GALLONS. TOWERS INCLUDED IF YOU WANT THEM.

PIPE
MACHINE BANDED OR CONTINUOUS STAVE—FOR WATER SUPPLY—IRRIGATION OR POWER. CHEAPER THAN ANY OTHER PIPE OF EQUAL SIZE OR CAPACITY. LONGER LIVED THAN ANY METAL PIPE EXCEPT CAST IRON.

Live Stock and Dairy

BUTTER SCORING CONTEST

By L. M. Davis

TWENTY-FOUR cubes of butter were entered in September scoring of the educational butter scoring contest held September 29 in San Francisco. The judges were T. J. Harris, official inspector of the San Francisco Wholesale Dairy Produce Exchange; John Sollie, of Eureka, and L. M. Davis, of the University Farm. With the exception of those who do not wish their scores published, results were as follows:

H. L. Beck, Danish Creamery, Fresno, 91½.

P. Bernasconi, Harmony Valley Creamery, Harmony, 90.

B. Berthelsen, Los Angeles Creamery Co., Hanford, 93.

N. Christensen, Dairymen's Co-op. Creamery, Tulare, 92.

J. Clausen, Riverdale Co-op. Creamery, Riverdale, 91½.

G. Decow, Mission Creamery, Peris, 90.

W. J. Grinsell, Libby, McNeil & Libby, Loleta, 94½.

Ed Hooper, Spreckels Market Creamery, San Francisco, 91½.

J. N. Jensen, Visalia Co-op. Creamery, Visalia, 92½.

Simon Koppes, Montague Creamery, Montague, 90½.

L. Larsen, Sunset Creamery, Loleta, 94.

O. Lommel, University Farm Creamery, Davis (not competing), 92.

B. Myers, Los Angeles Creamery Co., San Luis Obispo, 94.

P. Petersen, Valley Flower Co-op. Creamery, Ferndale, 90.

J. C. Phillips, Delta Creamery, Imperial, 91.

G. G. Plunkett, Visalia Creamery, Visalia, 93½.

Wm. Roby, Willows Creamery, Willows, 90.

Minden Butter Manufacturing Company, Minden, Nevada, 91.

The average score of this lot was brought down to 91.27 by the low quality of several entries. Except for cuts under the head of body, over 33 per cent of the entries would have scored above 93, but mechanical defects held the number to 25 per cent. The pronounced "off" flavor noticed in the lower scoring cubes was apparently due in most cases to a poor cream supply. Several of the lots possessed decided "bad cream" flavors, and were already beginning to "go off" and develop the stale flavor found in held lots of poor butter. Feed flavor was noticed in some entries, but there was a marked improvement in this respect over the last scoring. Conditions as to fall feed are being felt in some sections, as is also a shrinkage in the cream supply, which always is a temptation for dairymen to deliver less frequently. A few of the cubes showed a flat flavor, which can hardly be classed as objectionable, but which can be avoided with ease. Except for a limited trade, the butter which creates a market for itself is that which possesses a rich, clean flavor, rather than one which is too mild. The comments usually made on flat flavored butter is that flavor is lacking.

Salt Limit Being Crowded

In many instances buttermakers are pushing the salt content of their butter beyond a safe limit. It was necessary to make some cuts for excessive salt. Obviously, a butter which contains undissolved salt is objectionable, and is not salable at highest quotations. However, some makers are successful in incorporating a large percentage of salt, at the same time avoiding a gritty condition. The thought that the salt content is satisfactory so long as grittiness is not present is erroneous, and conversation with several different butter merchants revealed the fact that too much salt is being put into some of the butter handled on the market.

In this same connection it can be said that too many creameries are sacrificing quality for overrun. In the desire to increase profits, it must not be assumed that the only way to do this is to expand, do more business and crowd the overrun. Perhaps more than one creamery could be found which is barely holding out through the fact that ambitions point to more butter rather than better butter. It is not beyond reason to say that some of our creameries would be better off financially if they absolutely turned down and refused to accept some of the cream which they now almost fight to obtain. In examining a small shipment of ten boxes of butter on the market recently, three were found which would pass as "Extras." Regardless of the cause for this, it was a case of a creamery paying several cents above "Extra" quotations for butterfat, yet receiving not better price than "Prime First" for butter made from the cream. With a difference of but one cent between the two grades of butter, such business methods will eventually prove disastrous. Right now, quality is at a premium.

The fifth entry will be scored in connection with the California Creamery Operators' Association convention, October 28, 29 and 30. Contest buttermakers will be given credit for the score they obtain at the convention scoring. Information regarding this will be sent out later. Buttermakers not receiving notices of the bi-monthly scorings, who are interested, are requested to write for entry blanks and shipping tags. The convention scoring will be the largest contest of the year. Every creamery is urged to take part.

HOW I CURED BALKY HORSES

Written for California Cultivator
By H. C. Coe, Manhattan.

When I was a young man I was peculiarly unfortunate in having to use balky horses. Of course the first thing (and the worst thing) is to beat them. Undoubtedly a balky horse is the most aggravating object in the world, but beating is worse than useless. They generally fall down, breaking the tongue or thills, doing all kinds of mischief. So I gave up beating and tried patience. Once when some distance from home one of the team concluded to stop in the middle of a long, sandy stretch of road. I tried everything I ever heard of without success. He would not pull and one horse could not pull the load alone. It was getting late, along toward dinner time, and of course I was hungry. I unhitched from the wagon, tied the balky horse to the hind wheel and jumping on the other horse went home. When I returned the next day "balky" could hardly wait until I was in the wagon and wanted to pull the whole load. Now, try this on your next case of balks. Unhitch from the wagon, but don't unharness. Fasten up the tugs so that they will not get under foot, then take a rope about ten feet long (one of the reins will do if you have no rope) and fasten through both rings of the bridle, then take the buggy whip and start him going around in a circle. Don't get mad. Whip only just enough to keep him going. From a slow trot increase to a fast one, then later to a lope according to the severity of the case. As soon as he shows a tired feeling, sweating freely, take him out just as though nothing had happened and hitch him up. Should he still persist, try it again, and I think your troubles will be over for the time, and a few lessons will make a reasonably true animal out of him. I never failed.

LOST: 18,000,000 TONS OF HUMUS

A few weeks ago, when one of the experts of the federal division of animal husbandry was making a field trip through certain parts of Kansas and other north central states west of the Mississippi, he found the sky darkened with the smoke of burning straw stacks. Investigation proved that not only were the farmers burning wheat straw, but that stacks of sorghum, kafir, and other feeds were being reduced to ashes.

"On some of the wheat fields I found old straw scattered," he said to the writer, "but such instances were few and far between. It didn't look quite so bad to see wheat straw burning, but the sight of thousands of tons of sorghum going up in smoke was enough to make a livestock man weep."

"I asked some of the farmers why they were burning this feed and they answered that they couldn't afford to feed it; that, owing to the peculiar condition of the meat market that had resulted in fat cattle selling for less than thin feeders, they didn't have the money to buy thin cattle for their farms."

It is not the intention of the writer to attempt an explanation of the condition of the livestock markets that may have had something to do with this wholesale destruction of good feed and rich humus. But it is his intention and opportunity to present some brand new government figures which show what this wholesale firing of straw and feed stacks means to the country as a whole.

For the first time the department of agriculture has collected comprehensive data on the utilization of straw in the farming sections of this country. The figures have just been tabulated and checked.

Statisticians in the federal bureau of crop estimates have summarized all the reports and find that of the annual production of straw in this country—about 120,000,000 tons—some 17,612,000 tons are burned. Placing an average value of \$3.71 a ton on this, we get a total loss of \$65,344,230.

Even this does not represent the

total loss to our agriculture by the burning of straw. The less humus there is in the soil the smaller the yields and the more money spent for fertilizers.—Country Gentleman.

PURPOSE OF THE DAIRY BARN

The purpose of the dairy barn is to house the stock so that they will be as comfortable as possible. It should be built with as much economy of space as compatible with the number of cows kept and in a manner which will admit of as much economy of labor as possible. The barn should provide sufficient space for the storage of hay, fodder and the grain necessary to carry the stock through the feeding season. The entire structure should be constructed of durable material and at a minimum cost. Barns have been called the farmers' factories where grain and roughage are converted into the more expensive product, milk and butter fat. Whether the profits are large or small may depend largely on the comfort and housing conditions rather than on the feed that the stock receives. Dairy stock of a fair grade will give good results in a well built barn, while high grade stock may give poor returns in a poorly constructed barn.

Types of Dairy Barns

The type of dairy barn that one should build depends on a number of different factors. The location and topography of the land may favor one type over the other. Severe climatic conditions would favor a warmly constructed barn, while the sections with a milder climate could do without that type of building. The grade of milk produced would influence the construction of the barn to some extent. The amount of money available for building would influence the type of construction more than any other factor.—R. E. Hundertmark, Washington State College.

To make good butter it is necessary to have clean milk and healthy cows. Milk from unhealthy cows is not a safe article of food, even though there is no visible dirt in it.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Cough

I have a cow that has a sharp cough every ten or fifteen minutes. Have not been able to locate any swelling, foxtails or anything to cause it. She eats well and is apparently in good health every way. She is coming fresh again in two months and I wish to cure her before that time. Can you help me in this matter?—Subscriber, Templeton.

Try the following powders: Camphor one ounce, powdered belladonna leaves two ounces, powdered digitalis leaves two ounces and powdered licorice root two ounces. Mix and divide into 16 powders and give one in the feed every night. If this does not relieve her then have her tested for tuberculosis three or four weeks after being fresh.

Stumbling

I have a mare eight years old that has very recently commenced stumbling with one of her hind legs when driven on a trot in the buggy. During the week she works in the orchard. Have had her reshod and rested but find she still stumbles. Can you tell the reason?—Subscriber, Porterville.

Stumbling indicates a weakness of the muscles, probably caused by a strain. In this case, being in the hind leg, it must be due to some trouble in the muscles of the hip, the ones that

lift the limb while it is being carried forward. The muscles failing to lift the foot as high as usual allow it to come in contact with high places in the road. Bathe the hip with liniment and rest her for some time.

Mammitis

Have a cow that is a very hard milker. Undertook to insert a dilator that was about an inch long and a quarter of an inch in diameter. Think it was rather large. Inserted it about half the length and she kicked it out of my hand and lost it. That evening the teat was sore and somewhat swollen. Next morning milk was stringy and now there is a hard cord through the teat and up into the udder. No milk to speak of and that of a dark brown color and clotted. She has fallen off on the rest of her milk but milk from the other teats seems good. She is kept staked on alfalfa and fed alfalfa hay, etc. For a time was lame in the hind leg next to the affected quarter but walks all right again. Eats and drinks as usual. Thought she had been bitten by a snake but could find no marks. What can be done for her?—Subscriber, Valley Center.

Mammitis or inflammation of the udder may be caused by injuries, disease of the blood from a clogged system or by introducing microbes into the udder through the ends of the teats. The dilator you used was very large and if it was not sterilized just before using may have carried some microbes in with it or injured and stretched the muscle so the microbes could easily enter right after. It is quite evident that the work you did on the teat caused the trouble. The quarter will probably be lost but you may save it by bathing it with hot water, rubbing it and milking it out carefully three times a day. Also give a handful of epsom salts in the feed once a day for a week. More than that you had better not attempt to do.

Follow the Crowd to the Hanford Sale!

California Holstein Breeders Second Consignment Sale Hanford, Cal., Oct. 14 and 15

175 High-Class Animals 175

Tuberculin Tested

**Buyers Appreciate Quality. Quality Will Be Found Here.
See What You Can Buy at Your Own Price:**

25 A. R. O. cows with records as high as 29.90 lbs. butter in 7 days. Also a 24.45 lb. 3-yr.-old, a 22.50 lb. cow and others over 20 lbs.

30 daughters of A. R. O. cows, including 17 daughters of Colantha Sir Pontiac Aaggie out of cows with records of 30 lbs. (1), 29.90 lbs. (2), 24.45 as a 4-yr.-old (1), 24.45 as a 3-yr.-old (1), 22.50 lbs. (3) and others from A. R. O. cows—just as fine a lot individually as were ever led into a sales ring. Also daughters and granddaughters of Homestead Girl De Kol Sarcastic Lad, King of the Pontiacs, Pontiac Hengerveld Parthenia, Lorena Korndyke, King Segis Pontiac Emperor and other great sires.

Candidates for great records, don't overlook these. You can make a fortune buying and testing this kind, which have never been tested. There can be no limit put upon the value of their calves, bred as they are to many of the greatest sires in the West, including sons and brothers of world's champions.

Looking for a Herd Sire?

Well, your opportunity is at hand. About twenty good ones will be offered here, including a son of a 29.90 lb. cow, a 28 lb. cow and others from great record dams. **Remember, This is the Last Call!**

Col. B. A. Rhoades, Auctioneer, Los Angeles

Jas. W. McAlister, Jr., Sales Manager, Chino

Announcement—A daughter of Colantha Sir Pontiac Aaggie out of a 17 lb. dam just made 25 lbs. butter in 7 days. What will his daughters out of great record dams—such as offered in this sale—do when they commence to freshen? Is the answer hard to guess?

DETROIT, - MICHIGAN.

Making a Silo Pay

is an easy matter if you have the right kind.

The University Farm at Davis, Calif., last year bought an

Ideal Green Feed Silo

and tried it out in actual use beside others, including a home-made one they built.

They recently purchased another Ideal Green Feed Silo, which is the best evidence needed of their judgment of its quality and efficiency.

These two Ideal Green Feed Silos are used to help make a profit in their farm operations and were purchased out of their farm income.

The men in charge are business men and know a good thing when they see it.

Why not profit by their experience and order your Ideal Green Feed Silo now?

STOCK ON EXHIBITION

Continued from Page 339

dustries are in attendance. There are officials and other representatives of the various breed associations, and the show will be well reported to the live stock and agricultural press of the country. W. R. Goodwin, editor of the Breeders' Gazette of Chicago, and one of the greatest writers on live stock subjects in the world, is here to report the show for that paper, and expresses himself as very much pleased with the show, its management and California conditions in general. He spoke particularly of the exceptionally high class lot of men in attendance at the California Draft Horse Breeders' Association meeting and banquet, and predicted a bright future for an industry in such good hands.

Meetings of the leading breed associations are being held, and at the California Draft Horse Breeders' Association meeting Henry Wheatley, the shire breeder at Napa, was made president, and Professor J. I. Thompson, of the University of California, secretary.

This association banqueted the visiting breeders and exhibitors, and it was the opinion of the majority that it

although the number entered is not large. The competition is between Pacific Coast breeders and some from studs from Wisconsin, Illinois and Kansas. Alex. Galbraith of Canada did the judging.

The Pacific Coast breeders represented are John Troup, Goleta, John Painter, Salem, Oregon; O. H. Brandt Shellville; C. W. Bowers, Davis, and Francis D. Buck, Ripon.

Californian Shires are making a particularly attractive showing. Splendid individuals are entered by Easton & Ward, Burlingame; Henry Wheatley, Napa; C. W. Bowers, Davis; Jack London, Glen Ellen, and the Bridgeford Company, San Francisco. The show is in charge of Chas. W. Burgess, secretary of the American Shire Horse Association, Wenona, Illinois, who is doing the judging. The competition from Eastern breeders is very keen.

All of the standard bred horses belong to California breeders and are being judged by W. A. Palmer, Ottawa, Illinois.

There is a big show of gaited saddle horses. The competition between Eastern and Western breeders is particularly keen, and the interest indi-

Sir Holland Gamp

A great show bull and a prize winner wherever shown. A number of cows will be in calf to him. Consigned by Alex. Whaley at Hanford.

would be well for the association to continue to hold public consignment sales, as was done this year at Davis. The small breeder and the beginner in the pure bred draft horse business will be encouraged and interest in the business stimulated in this way and the distribution of good horses over the state hastened.

Interest in the horse business is indicated by the fact that during the horse show there has been the largest attendance for "mid-week" days since the beginning of the show.

The harness and saddle classes and the polo games and other sports make a spectacular and interesting part of the show, as do the events participated in by the United States regular army officers and soldiers.

Numerically, the Percherons make up the largest part of the pure bred draft horse show. They are in charge of the Percheron Society of America and are judged by Professor C. F. Curtiss, dean of the Iowa state agricultural college. A particularly strong part of the show was made by California breeders. Among these are Anita M. Baldwin of Los Angeles, who had the most spectacular display in the whole horse show; Thos. D. McLaughlin Importing Co., Oakland; Dunham-McLaughlin Co., Oakland; John Secrest, Stockton; Wm. Bond, Newark; M. Bassett, Hanford; H. G. Learned, Stockton; C. W. Bowers, Davis; A. S. Ashe, Halfmoon Bay; E. B. White, Oakland. Many of the prize ribbons went to these breeders.

There are fewer Belgians shown, but among these are many outstanding individuals. The superintendent of this class is J. D. Connor, Jr., secretary of the American Association of Importers and Breeders of Belgian Draft Horses. The judging is being done by Samuel Bell, Wooster, Ohio. Among the Pacific Coast breeders represented in the winnings are C. W. Bowers, Davis; G. J. Luhrsens, Bethany; A. C. Ruby, Gresham, Oregon, and James Edson, Carlton, Oregon.

A select lot of Clydesdales are shown,

cates that horses of this type are in great demand by people who can afford to own them. Some of the best gaited horses ever shown in America or the world were exhibited, the very acme of saddle horses excellence. California winners are Adelaide S. Gillis, Los Angeles; R. L. English, Chino; Mrs. Charlotte B. Anderson, Oakland; Bridgeford Company, San Francisco; Martha Freeman, Los Angeles; F. J. Bosk, Sawtelle; Mrs. E. P. Riggle, El Centro; John E. Marble, Los Angeles; Mrs. W. E. Buck, San Francisco; Thornberry & Shropshire, Los Angeles; W. J. Smyth, Oakland; Etta H. Scofield, Oakland; L. C. Deming, Anaheim, and J. S. Bryan, Hollister.

Morgan horses were shown by Morgan Horse Farm, Plainfield, Iowa, and Jos. C. Breenk, Springfield, Illinois. They are being judged by G. Howard Davidson, Millbrook, New York.

A select lot of hackneys are being exhibited by the Woodland Hackney Stud, San Francisco.

One of the most interesting exhibits in the show is that of Arabian horses, shown by Anita M. Baldwin, Los Angeles, and S. C. Thompson, San Francisco.

Shetland ponies are shown by several large eastern breeders and by Ina M. Richter, Santa Barbara, and John Troup, Goleta.

The jack and jennet show is in charge of Wm. F. Morton, secretary of the Standard Jack and Jennet Registry of America, Kansas City, Missouri, and they are being judged by F. B. Graham, Kansas City, Missouri. Splendid individuals are being shown by several breeders from the East and by M. A. Merrill, Willows; Anita M. Baldwin, Los Angeles; Blevins Brothers, Williams, and Eaton & Hughes, Santa Rosa.

The management of the exposition has reason to be mighty proud of the horse show, and California of the showing made by local breeders.

Imperial has fixed a price of 12 cents for fancy cotton.

BREEDING MILCH GOATS

As this is the season of the year when most milch goats come regularly "in heat," it may be in order to offer a few suggestions relative to the best methods of handling the buck and does at this time. During the summer months the bucks show little if any interest in the does and it is my practice to have our bucks in fine condition then, as when the rutting period begins they show great uneasiness and rapidly lose flesh. I like to have the bucks in good flesh and heavy before fall, especially the young ones, for young bucks frequently become so overwrought during the breeding season they will not eat heartily and consequently their growth is retarded. Buck kids dropped early in the winter are usually the finest, as they have more time to develop before the breeding period begins than those kidded at a later date. It is unwise to use a buck for service under less than ten months of age, and it is my custom to have a young buck serve some three does after he is ten months old, so that his value as a buck may be determined. He is permitted to breed these few does with intervals of a week at least between breedings, and I consider it unwise to use a young buck often until he is about 18 months of age. At this age a well fed buck can readily serve 20 or more does. Owing to the strong odor of the bucks, I find it worth while to use a blanket on does that are to be bred, as the blanket keeps the odor from permeating the doe's coat. If care is used not to allow the buck to rub himself against the doe, scarcely any of his objectionable odor is noticed on the doe after the breeding.

Sometimes lice prove troublesome on goats, and it is a very good plan at this time of the year before does are bred to dip with a mixture of kerosene and grease to eradicate these pests. Use one part grease, such as suetene or lard, to three parts kerosene. Heat the grease, then stir in the kerosene. Between one pint and one quart of this mixture is enough for each goat. Use an absorbent cloth, such as flannel, to rub the dip well into the coat, applying especially generously to the thighs, where lice are usually thickest. This dip is harmless and effective, but do not use kerosene without the grease, as it will injure the skin, whereas the addition of the grease acts as a modifier and prevents burning or blistering the skin. For a time after application of this dip a goat looks mussy, but after her fall coat comes in it will be clean and glossy and it is benefited by this application if it is properly applied.

Poultry for Profit

THE DOMESTIC GOOSE

Written for California Cultivator
By Jean A. Koethen

GEESE have been kept in domestication from earliest times, so far back that it is impossible to say when they were wild. Indeed it is asserted that the wild geese now known are of quite a different species. Most authorities however agree that the common farm goose of America and England is descended from the indigenous wild goose of the British Isles, known as the gray lag goose.

Amazing stories are told of the long life of geese. It was customary in old times in some parts of the country for the farmer's daughter on her wedding day to receive a goose from the old homestead. This was taken to the new home and often outlived its mistress. There is on record a goose owned by a Massachusetts man, that lived 101 years and then was killed by a kick from a horse that had ventured too near the nest on which she was sitting. She flew off the nest in defense of her eggs, caught the horse by the tail and received a kick which ended her life. Good geese may be kept with profit till they are 25 years old, but ganders are less useful after seven or eight years and are usually replaced after that age.

Geese incline to mate in pairs, but a young gander will often take care of three or four females. It is said that if a pair are left alone in a field together till they have had time to get acquainted and to become perfectly satisfied with each other they will never mate with others. Fall or early winter is the best time for mating geese because it gives geese and gander time to become accustomed to one another.

Breeders should be hardy and not overfat. Select a gander not less than two years old, with large, bright eyes, massive neck, and deep full breast. The goose should be a clean bird—for sickly birds are always dirty—and not too closely related to the gander. Geese are valuable breeders up to their twelfth year but are at their best from the second to the fifth or sixth year. It is better to breed neither goose nor gander under two years. If you do there will be many infertile eggs, because the birds are not mature until this age.

The hatching season begins early in spring whenever the goose begins to lay. Many breeders set the first clutch of eggs under hens, break up the broody goose by destroying or removing her nest, and let her lay another clutch before she sits. Some let hens do all the hatching. A large hen can cover five or six goose eggs.

When hens do the hatching the eggs should be sprinkled with tepid water daily while the hen is off feeding. This sprinkling takes the place of the wetting they would receive if they were under a goose and she came back from her daily meal and swim with wet feet. If the eggs are under a goose and she has no opportunity to swim during incubation I suppose the eggs need sprinkling as much as they would under a hen. The shells of goose eggs are so thick and tough that if they are not softened by frequent moistening the little gosling has great difficulty in breaking through. When this occurs the caretaker must help the gosling out by breaking the shell and making a hole large enough to enable the gosling to clear itself. Any interference, however, must be with great care.

When pipping time comes, which is about the thirtieth day, the hen must be watched, for she may not like the looks of these queer gray creatures. I had the disappointing experience last spring of caring for a hen through a 30-day incubation, only to find three of the four eggs she sat upon infertile and to see the one forlorn gosling that did hatch killed by its mother's

beak. These are the lessons we remember.

Nests for geese on range should be in out-of-the-way places where they can be hidden as much as possible. The sitting goose will sit only in the nest she has laid in, and this should be kept in mind when the nests are prepared. When geese are kept in confinement it is a good plan to have a long, covered pen, about four feet high, divided into as many compartments as there are laying geese. Each compartment should be about three feet square with a board cover on hinges so that it may be raised when necessary. If the pen is under a shed the covers of the compartments may be omitted. A few handfuls of straw will provide all the nesting material necessary. If the geese are watched at first, and each compelled to lay in a separate pen from the start, they will usually keep their nests through the season.

The eggs should be removed from the nest as soon as they are laid and several china eggs kept in the nest so that the goose may not have her suspicions aroused. Lay the eggs on a layer of cotton in a pan or box, cover them with a thin cloth and set them in a cool place. Turn them daily. A goose lays every other day. If she is a prolific layer she may lay 30 or 40 eggs in one clutch. In such a case it is absolutely necessary to set the first eggs laid under hens, for long keeping makes weak goslings. Goose eggs hatch well in incubators and turkey hens are often used for hatching.

When the goose becomes broody after laying her second clutch of eggs the nest should be carefully prepared before the eggs are given to her. Remove the straw and feathers from her pen, hollow out the earth a little and cover with a layer of fine, dry dirt and another of straw or chaff, with some of her feathers on top. The nest must be so deep that the eggs will not roll out when she leaves it.

In parts of England laying geese are provided with huts or cages of willow twigs. These are turned over and an opening left large enough to admit the goose easily, with a hollow space at least two feet in diameter inside. Sometimes these nesting huts are placed in a shed.

A small goose will cover 12 eggs and a large one 16 or 18. The sitting goose should be fed regularly, and sand, gravel and fresh water placed near her. She should be left undisturbed except for a daily visit to see that she is on her own nest and that none of the eggs have rolled from under her. After the eggs begin to pip leave the geese entirely to themselves till the hatch is over, when the goslings that have failed to free themselves from the shell may be helped out.

The goslings should be left in the nest for 24 hours after hatching. Set a shallow dish of water near with a little wheat bran and bread crumbs or bran and hard-boiled eggs on a board. The day after hatching if the weather is pleasant the goose will slowly coax her brood from the nest and into the open. The first ten or twelve days goose and goslings may be kept in a coop or portable pen on lawn or other good green range, still feeding the bran and egg. After this they may have their freedom.

The ideal home for geese, young and old, is a pasture. Perhaps it is because of our lack of pasture in California that more geese are not raised. It is said that the cropping of the grass and especially of the weeds by geese is most beneficial to pasture land. There is an old saying that "nothing can eat after a goose" because it crops so close. Theodore F. Jager tells in Harrison Weir's "Poultry Book" of a relative of his, a dairyman, who found that when his cows were pastured in a certain field the butter was so bitter as to be unsalable. "Turn 20 or 30 geese into the

Help Your Hens Moult. Tone Them Up

GILBERT HESS
M. D., D. V. S.

Here is My Guarantee

So sure am I that Dr. Hess Poultry Pan-a-ce-a will make your poultry healthy, help them through the moult, start your hens and pullets laying, that I have authorized my dealer in your town to supply you with enough for your flock and if it doesn't do as I claim, return the empty packages and get your money back.

The quicker you get your hens over moulting, the sooner they will get on the job laying eggs. Moulting saps a hen's strength; to force out the old quills and grow new feathers needs lots of energy. Help your hens along with a tonic. In Dr. Hess Poultry Pan-a-ce-a you have a scientific preparation that puts vigor and health into your flock—it will aid their digestion, build them up, give your hens the vitality to ensure quick feather growth, tone up the dormant egg organs and help them lay.

Dr. Hess Poultry Pan-a-ce-a

A Tonic—Not a Stimulant
Formula printed on every package

My Pan-a-ce-a contains tonics, blood builders and internal antiseptics. It is formulated after a prescription of mine which has had a successful record for 22 years. In this prescription I have combined scientific knowledge with poultry culture; behind it is my long experience as a veterinarian, doctor of medicine and successful poultry raiser.

My Pan-a-ce-a is easy to feed—put it in the mash wet or dry. Pan-a-ce-a is sold by a reliable dealer right in your home town whom you know. Read my guarantee.

My new Poultry Book tells all about Pan-a-ce-a. It's free. 1½ lbs. 25c; 3 lbs. 50c; 7 lbs. \$1.00; 25-lb. pail \$3.00. Pan-a-ce-a costs only 1c per day for thirty fowl.

Dr. Hess Stock Tonic Expels Worms

It's almost a certainty that your hogs are wormy right now. I guarantee that my Stock Tonic will positively rid your swine of worms, tone them up and help them put on fat. I advise you also to feed my Stock Tonic to your horses, sheep and cattle as they go from pasture to dry feed. It will keep them in fettle, enrich their blood, keep the bowels regular and is a splendid aid to digestion. But especially as a hog worm expeller it will pay you to feed my Stock Tonic now and all winter. 25-lb. pail \$2.25; 100-lb. sack \$7.00. Smaller packages as low as 50c. Why pay the peddler twice my price?

Dr. Hess Instant Louse Killer

Kills lice on poultry and all farm stock. Dust the hens and chicks with it, sprinkle it on the roosts, in the cracks, or keep it in the dust bath, the hens will distribute it. Also destroys bugs on cucumber, squash and melon vines, cabbage worms, etc., slugs on rose bushes, etc. Comes in handy sifting-top cans, 1 lb. 25c; 3 lbs. 60c. I guarantee it.

WANTED

Wanted—To hear from breeder of White Wyandottes who can supply fertile eggs in January. Bellow Bros., Lakeside, Cal.

Wanted, good farm land in exchange for income property. J. H. Wood, 422 Van Nuys Bldg., Los Angeles, Cal.

Wanted to hear from owner of Farm or Fruit Ranch for sale. O. O. Mattson, Minneapolis, Minn.

Wanted—To hear direct from owner of good farm or unimproved land for sale. C. C. Buckingham, Houston, Texas.

SCHOOLS AND COLLEGES

Wanted—About seventy-five young men and women to enter The WESTERN NORMAL on August 30th, to prepare for teaching. Western Normal graduates secure and hold good positions. We assist graduates to secure good positions and promotion. We save you time and money. For information, address, WESTERN NORMAL, J. R. Humphreys, Principal, Stockton, Cal., 634 E. Main St.

Telegraphy—Stenography, bookkeeping, English branches. Positions guaranteed. Mackey Business College, Los Angeles.

FARM LANDS FOR SALE

The owner of 3000 acres near Madera desires to subdivide for real settlers; the land is typical San Joaquin valley loam, free from alkali, and will grow anything; railroad crosses property and there is abundant water at shallow depth; the land is for sale at the right figure to people with proper qualifications; no cash payment down and terms to suit, provided the purchaser has sufficient money to put the land under water. Remember that there are no real estate commissions to pay to swell the price of the land; all the owner wishes is interest on his money. No real estate agents need apply. GREENE ESTATE COMPANY, 207-208 Berkeley Bank Building, Berkeley, Cal.

Carlsbad Irrigated Farm Land—Bordering ocean, on state paved highway and Santa Fe Ry.; 80 miles south of Los Angeles; government records show Carlsbad warmest in winter, coolest in summer of any spot in Cal.; deep sandy loam, model water system; low rates; lemons mature in summer when price is highest; immense profits in fruits and berries adaptable to coast territory; winter vegetables without competition; minimum temperature 1914 was 41 degrees; tomatoes, chili, peas, beans, eggplant, rhubarb, etc., bring \$150 to \$400 per acre; easy purchase terms. South Coast Land Co., G. Buxton, Sales Agt., Carlsbad, Cal.

FARMERS WANTED

VICTORIA, AUSTRALIA, offers special inducements. Government land, water, railways, free schools, 3½ years to pay for farms adapted to alfalfa, corn, sugar beets, fruit, etc. Climate like California. Ample markets. Reduced passages for approved settlers. Free particulars from F. T. A. Fricke, Government Representative from Victoria, 687 Market St., San Francisco, Cal., Box X.

Good Government Land relinquishment of 160 acres for the price of the improvements and work done; house, barn, fencing, fine climate, wood and water, \$650 cash. W. Wallace Baldy, Raymond, Madera Co., Cal.

Cheap—Six acres Blue Gum Eucalyptus, El Cajon valley, county of San Diego, near railroad; trees over 3 years old; price very reasonable; must sell immediately. Further information, price, write A. P. Schummers, 100 N. Franklin, Austin, Minn.

State Map Showing School Land in different counties of the State, plainly marked, \$2.50. County sectional maps, showing vacant U. S. Land, plainly marked, \$2.50 each. Order TODAY. Booklet, FREE. Joseph Clark, Sacramento.

For Sale—140 A. near Porterville; 20 A. year old early navels; 15 A. more ready to set; 60 A. alfalfa; private ditch, free water, good buildings, well located and priced right. Write for particulars. Box 39, R. F. D. No. 4, Porterville.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

For Sale or Exchange for Southern California acreage, 4 acres fine bulb or vegetable land in city of Santa Cruz. William Richard, owner, 438 River St., Santa Cruz, Cal.

SEEDS AND PLANTS

Burbank Spineless Cactus—Hardest varieties, "Melrose" and "Special." Strong, matured slabs, \$3.50 per 100; \$50 per 1,000. Labranza Ranch, Athlone, Merced Co., Cal.

For Sale—First class re-cleaned alfalfa seed that has been inspected in the field by the Horticultural Commissioner, and is free from noxious weeds. Also choice Peruvian seed. O. C. Nordahl, Bard, Cal.

Fifty tons of choice white Egyptian corn for sale at \$30.00 per ton f. o. b. Lemoore, also a few tons of choice feterita at same price. C. R. Flory, Lemoore, Calif.

Peruvian Alfalfa Seed—Hairy varieties, also Algerian wheat. S. P. Huss, Yuma, Arizona.

MISCELLANEOUS

Just to get acquainted we will give FREE a combination Manicure Tool, Nail File, Glove Buttoner, Button Hook, Twine Cutter and Bottle Opener with every order for ten fine post cards for ten cents. Ten fine cards and handy tool for one dime. Frankwilk Company, 5232 Fifth Ave., Chicago, Illinois.

We Will Pay You \$120.00 to distribute religious literature and take orders in your community; 60 days' work. Man or woman. Experience not required. Spare time may be used. INTERNATIONAL BIBLE PRESS, 936 Winston Building, Philadelphia.

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

FOR LEASE

Fruit Ranch For Lease—High class apricot and grape ranch, located in the Imperial Valley, for rent on share basis to good man who can finance the labor needed. Produces the earliest apricots and grapes in the United States, so commands fancy prices. A high class proposition for an experienced fruit man with a little money. The American Nile Company, El Centro, Cal.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

THE DOMESTIC GOOSE

Continued from Page 353

field and let them eat up the bitter weeds that are spoiling the butter," ordered Mr. Jager. The relative demurred, but finally took the advice, and thereafter the butter was sweet and good. "Where a number of geese have foraged," says Mr. Jager, "the grass comes juicy, close and better."

Geese on good pasture need little grain. Wheat and hulled oats after the bran and bread crumbs of the first ten days are left behind; wheat and oats in the morning, with cracked or whole corn for a night ration after the birds are old enough to swallow such large grains, make a sufficient ration. Some breeders feed the goslings after the first ten days bran, ground oats or middlings mixed with hot water, and do not give whole grain till the birds are ten weeks old. Young goslings do not care for sloppy food. Whatever they have must be dry or crumbly. A cake of corn meal, bran and middlings, heated thoroughly in the oven, but not baked crisp is a very good first feed.

Water should be before the goslings in a fountain which will not permit them to wet their down. After they have their real feathers they may go swimming, but not till then.

Since geese and ganders are feathered exactly alike it is often difficult to distinguish them. Some breeders determine the sexes by the difference in the voice, that of the gander being heavy and coarse while that of the goose is higher and more shrill. A gander is a little more heavily built, with longer neck and larger head, but this difference is not always noticeable in young birds. It is said that in Cambridgeshire a curious plan is followed. All the geese are shut in one small pen or building and a small dog is then put in. It is said that the geese will all lift up their heads and go to the back of the place, while the ganders will stretch out their necks and hiss.

The goose is intelligent, interesting and easily and cheaply raised, but it has one fault which brings it to pass that very few reach a ripe old age. Its domineering temper makes it sooner or later an insufferable member of the family, for it is satisfied with nothing less than absolute mastery. When this time comes there is but one remedy, and Mr. Gander or Mrs. Goose is guest of honor at the Christmas dinner table.

BREEDING MILCH GOATS

Continued from Page 352

On no account dip a doe that is known to be pregnant until after she kids.

Among some goat owners there is an erroneous idea that the buck is responsible for the number of kids a doe may drop. I know of an instance where a man wished his doe bred to a certain buck because the year previous when served by this same buck she had triplet kids. The number of kids at a birth is determined solely by the number of ova produced by the doe. When a doe is "in heat" from one to three or sometimes, rarely, even four ripe ova are discharged by the ovaries. These ova if fertilized by the semen of the male, develop into kids. It therefore may be plainly understood that the buck in no manner whatever influences the number of kids at a birth.—Winthrop Howland in Angora Journal.

On the front cover of our issue of September 22 we published photographs of two calves raised by McAlister & Son of Chino. The top photograph represented Abby Segis Pontiac at 12 months, weighing 908 pounds, and the lower one represented Wiegertze Girl Pontiac, at 12 months, weighing 880 pounds.

Inasmuch as these weights are very exceptional we desire to call attention to the fact that the calves were raised on a diet consisting exclusively of alfalfa and dried beet pulp. McAlister & Son state that they feed their calves a ration composed of about 75 per cent beet pulp and 25 per cent barley until four months old, after which they feed dried beet pulp exclusively. The value of dried beet pulp over other concentrated feeds is shown in the fact that at the Kansas station the average weight of their calves is only 669 pounds at 12 months, and Henry, in his "Feeds and Feeding," states that "whoever attains these figures in rearing calves should be well satisfied."

At the Michigan station under a heavy ration of grain the average weight of 57 calves at 12 months was 648 pounds. We understand that McAlister & Son have attained a regular average at 12 months of 895 pounds, and they are certainly to be congratulated on this record. This seems to indicate not only the care with which McAlister & Son raise their calves, but also that alfalfa and dried beet pulp make a splendid ration.

Questions and Answers

THE EDITOR

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Roup in Turkeys

Half grown turkeys have swelling under eyes. Have opened and found only pus. Have fine appetites.—Subscriber, Oroville.

These turkeys undoubtedly have roup, though just why they should with such splendid range it is hard to see. Perhaps they have been sleeping indoors. Perhaps there is roup ancestry back of them somewhere. The potassium permanganate treatment so often recommended for chickens will relieve the stopped-up condition of the head and nostrils. Get five cents' worth of potassium permanganate crystals from your druggist and put just enough in a quart of lukewarm water to give the water a good pink color. Dip the turkey's head in this solution and hold it under while you count five. Give this treatment night and morning to each sick turkey. You might also try a few doses of quinine. Give a one-grain capsule at night three nights in succession, then discontinue for three or four days. If the bird does not improve, repeat the treatment three days more. See that the sick birds have plenty of fresh air at night, but it may be necessary to shelter them a little until they recover.—J. A. K.

Dipping Potatoes

In your issue of September 23, page 299, you refer to dipping of potato seed. Is this before or after cutting? Also, how long after the dipping should they be planted?—Subscriber, Tres Pinos.

The dipping should be before cutting, and while we do not think there is any great difference, planting should be at the earliest convenient time after the dipping. We doubt not a few days would make but little difference.

Persimmon Not Bearing

I have a Japanese persimmon eight years old which a few years ago bore fruit, but the last three years has dropped the fruit soon after it forms. I have tried more water and find no difference. The tree stands in the chicken yard and has an occasional spading about the roots. What is wrong?—K. C. M., Los Angeles.

Try some wood ashes around the roots, and if this fails there may be some trouble with the blossom clusters. It may be that a scab or some small insect like a thrips causes the fruit to drop. I have seen scab so thick on loquat fruit that it was almost worthless. Many of our cluster fruits drop through the devitalizing effects of small insects working on them when the fruit is in blossom stage and even after the fruit starts to grow. These are best destroyed or kept away by standard sprays that may be bought on the market and should contain some solution of nicotine.

Worms in Chickens

I am losing a lot of growing chickens with worms. They develop the worms seemingly when they are between two and four months old. I have tried various remedies but without any degree of success. Can you advise a remedy that will be effectual?—Subscriber, Santa Barbara.

Better move all young stock to fresh ground. The fact that the chickens

are so severely affected seems to indicate that the soil they are on is badly infested with these parasites. Then give oil of turpentine, one tablespoon of the oil beaten with a new laid egg and mixed thoroughly by shaking. Give a teaspoon of the mixture night and morning for a few days. Powdered areca nut is also considered a specific for intestinal worms. Divide one-fourth of an ounce of the powder into four parts and give one part each morning, fasting, with a dessertspoon of olive oil two hours after each powder. Pumpkin seed chopped and fed freely is also used.—J. A. K.

Breeding Gobblers

Would a gobbler hatched last January or February do for breeding purposes for the coming season?—Subscriber, Salinas.

You can use a gobbler younger than this if the hens are two years old or older. The mating of a tom of last season's hatch, April or May, with mature hens is considered one of the best. Never mate a young tom to pullets.—J. A. K.

Geese

Would some one please tell me through the Cultivator something more about geese. How can one keep them all in one house when they sit? If so kept do they usually find each one her own nest when returning from feed? How many females can one keep with one male? How can one tell a gander when about seven months old? I have 12 and they all look alike to me, only some have a thin high-pitched voice and some low and coarse, like a duck.—Subscriber, Salinas.

These questions are answered in Mrs. Koethen's article in the poultry department this week.

Chicken Pox

Mrs. Koethen seems to be an exhaustless fountain of information and advice for the poultryman, so I would like to ask her what, in her opinion, is the best advance action to be taken to ward off chicken pox among hens in large flocks. The dry winters I never see it, but the last two wet seasons it has seemed impossible to keep it off. A large majority of the hens seem immune. Is it possible to tell in advance what hens are most likely to have it? Is the cresol disinfectant made as directed in our state agricultural college circular 99 considered a good preventive disinfectant against chicken pox? I cannot see that it has any effect. In fact to use any kind of liquid disinfectant only seems to increase the dampness without checking the disease.—Subscriber, Inglewood.

I never used cresol disinfectant, because I have found crude carbolic acid and kerosene, one part carbolic to three or four of kerosene, sufficient for my needs and more easily prepared, but the cresol is recommended by all the authorities and ought to do the work if used in sufficient strength. Circular 99 recommends a three per cent solution, but the Maine station suggests that where infection with the germs of disease is suspected the cresol may be used in double strength and applied with a scrub brush in addition to the spray. If the disinfectant does not dry out quickly enough in your houses why not try Carbolineum or the kerosene and carbolic mixture, made extra strong? I doubt if any germ can survive a painting with crude carbolic acid. Perhaps you have sprayed instead of painting. I have never found spraying very satis-

factory for I never feel sure that every spot has been saturated. You realize of course that chicken pox is an infectious disease and must come from a germ somewhere. The germ may live for years about the buildings or feed troughs or water fountains or it may be carried by lice, ticks, mosquitos or by new fowls introduced into the flock. I think it might be carried in an epidemic year on the clothing of a person coming from an infected plant. It is for you to find out where the infection comes from and protect your flock against it. Perhaps your houses are dark. Germs thrive best in darkness. Sunshine is the best of all germicides. The only drug I have ever seen recommended as a preventive for chicken pox is calcium sulphide. Dr. N. W. Sanborn says that this drug, given to chickens that have been exposed to chicken pox, will keep them from taking it, and given to fowls already affected with the disease mitigates the violence of the attack. The drug must be fresh and strong to be effective and is given in doses of one grain for each five pounds of poultry. Mix the drug in a small amount of moist mash and feed once a day for two weeks. When used merely as a preventive it need not be used so long. It would not be wise to use it unless the disease made its appearance, but if one single case appeared I should isolate the sick bird and give the dose for several days to the whole flock.—J. A. K.

Borers

I set out some young apple trees last spring which were all making a fine growth until about a month ago, when occasionally one would die back and a new shoot would come out. Upon making investigation I found something had bored in under the bark just at top of the ground, boring in the wood all the way around the tree. Please advise what is causing the trouble and give a remedy for it.—Subscriber, Saugus.

In all probability this is simply a severe case of flathead borer. However the subscriber should make an investigation, following the burrows of the pest until the "worm" is discovered. Then if he will send us specimen we can quickly determine as to proper treatment, though the only satisfactory treatment is to find the burrowers and kill them by using either a wire or sharp knife. Of course no exterior spray or treatment is effective. After the pests are all removed from the trunk then painting with asphaltum six or eight inches about the base of the tree will usually prevent entrance of the pest.

Figs and Dried Fruits Wanted

A subscriber from Naples (California) writes: "Where can I obtain sun dried, unsulphured, black Mission figs? I would like to get in touch with some fruit grower who makes a specialty of pure sun dried fruits."

Surely such a request should meet with many responses from this state.

Limberneck

My chickens seem to have a disease of the neck like St. Vitus dance. Have lost one hen and a rooster is now affected. Can you give me any information in regard to this matter?—Subscriber, Orosi.

Your chickens have probably been eating putrefied meat, moldy grain or something else that has upset the digestion. Give each affected bird 50 to 60 grains of Epsom salts or three to four teaspoons of castor oil, and try to find the cause of the trouble. I lost a number of birds one year with this disease, which is called limberneck, and finally concluded that it came from bran and chick feed which had become moldy on the ground in one of my Philo coops. Sometimes a dead chicken left unburied on the range will start an epidemic of this sort.—J. A. K.

PIONEER ROOFING

—was chosen to cover the big exhibit palaces at the Exposition, because of its reliability and genuine worth. Pioneer Roofing has stood every test of heat, cold, rain and wind for more than 27 years; is economical at first and at last; needs no paint or repairs. It is sold under a guarantee that really guarantees.

A SONG OF TRIUMPH

Work!

Thank God for the might of it,
The ardor, the urge, the delight of it—
Work that springs from the heart's desire,

Setting the brain and the soul on fire—

Oh, what is so good as the heat of it.
And what is so glad as the beat of it,
And what is so kind as the stern command.

Challenging brain and heart and hand? ;

Work!

Thank God for the pride of it,
For the beautiful, conquering tide of it,
Sweeping the life in its furious flood.
Thrilling the arteries, cleansing the blood,

Mastering stupor and dull despair.
Moving the dreamer to do and dare.
Oh, what is so strong as the summons deep,

Rousing the torpid soul from sleep?

Work!

Thank God for the pace of it,
For the terrible, keen, swift race of it,
Fiery steeds in full control,
Nostrils aquiver to greet the goal,
Work, the Power that drives behind,
Guiding the purposes, taming the mind,

Holding the runaway wishes back,
Reining the will to one steady track,
Speeding the energies faster, faster,
Triumphing over disaster.

Oh, what is so good as the pain of it,
And what is so great as the gain of it?
And what is so kind as the cruel goad,
Forcing us on through the rugged road?

Work!

Thank God for the swing of it,
For the clamoring, hammering ring of it,

Passion of labor daily hurled
On the mighty anvils of the world.
Oh, what is so fierce as the flame and doubt,

Calling the plan of the Maker out,
Work, the Titan; Work, the friend,
Shaking the earth to a glorious end,
Draining the swamps and blasting the hills,

Doing whatever the Spirit wills—
Rending a continent apart,
To answer the dream of the Master heart.

Thank God for a world where none may shirk—

Thank God for the splendor of work!
—By Angela Morgan, in New York Evening Mail.

A PROFITABLE FAMILY

Written for California Cultivator
By Maude Barnes

I was not because I had been trained or had any previous experiences in hog raising that I put forth my efforts along that line, but because several hog mothers belonging to a neighbor refused to own their offspring. Pity for the little pigs, mingled with a desire to see what kind of a mother I could be to them, led me to adopt 16 for a family.

The Imperial Valley, in the Colorado desert, had been calling for settlers to come and reclaim its waste acres, and my husband and I answered the summons and made one more home on the banks of America's Nile.

I could see no reason why I could not with good results apply the same methods I had used in my home and in business life and find them successful in my new venture, so I went about my family raising in a methodical way.

First of all I noticed that the wee pigs were just as clean and pink skinned as any new born animal and I determined to keep them so. I had a small movable pen for them, and in one end of it I made a snug little room where they could sleep warm, for the nights were cool and I knew my pigs must not get chilled.

I had only one pig that did not learn to drink readily. He positively refused to take any milk unless I fed it to him with a spoon, and this I did for two long weeks. At first I fed my pigs, one by one, out of a dish, for even little pigs are piggish and I wanted them all to get the same amount of nourishment. They had their milk often, but only a small amount each time. Little pigs are very easily overfed. I found this out to my sorrow when one little fellow got more than his share. He was taken sick with bowel trouble and I could do nothing to save him. Chloroform, which I procured from our nearest town, came too late to benefit him. As the pigs grew older I used a little trough to feed them in and they were always watching for me to come to the pen. They would stand up and beg and squeal, as loudly as small pigs

could when meal time arrived. I fed them also dry hay and a little green alfalfa.

It took care and patience, but day by day I could see my pigs grow. I had discouragements, of course, such as when I lost the one by overfeeding and another got out of his warm bed at night and in the morning I found him chilled and limp. I brought him into the house and wrapped him in warm cloths and gave him a warm drink. He rallied and was able to be with the pig family again, but the chill he had received was too much for him, so I was another pig short.

Pig life was a new study to me. I was quite surprised at the intelligence they displayed. They were so clean and so delighted to have their adopted mother near, that I could not help making pets of them. My spoon-fed pig was sadly humored and followed me every where on the ranch like a dog. Every night it would go with me when I went to gather the eggs, even to the tops of the hay stacks. I would often take them all along for an evening stroll, for exercise was good for them.

I was desirous of seeing the financial side of my venture hold up and it certainly did. The milk, with the exception of the first few weeks, that I fed the pigs was separated milk and therefore worth but little. The hay was a small item, and the fresh alfalfa, the main feed, I cut with a hand sickle along the sides of the water ditches where it would have gone to waste. Not until the pigs were shoats, or nearing the size where the name of hog would be applied, were they fed grain, and then how they did grow! I was fortunate indeed to have several fine brood sows among my 14 hogs.

I am not going to state just what my family netted me in cash, for it would sound like a proverbial California story, but I felt well repaid for my trouble when I received a check for my ranch "fancy work."

CARE OF MEN'S CLOTHING

Written for California Cultivator
By A. M. H.

The woman who is truly economical seeks not only to make a garment last longer, but to preserve its creditable appearance as well, and often a little work will make it look like new. It is a good plan to keep a package of absorbent cotton in a convenient place in the dining room, as a bit of cotton instantly applied will remove oil, milk or cream before they have time to leave a stain on the fabric. When silk neckties become slightly soiled they can be cleaned by brushing with a soft cloth or brush dipped in gasoline, and neckties can be quickly and easily made from pieces of silk or satin by using an old tie for a pattern and sewing on the old lining just as the original was put on.

When a vest has become too small it can be made plenty large enough by setting a piece in the back. This piece must be very narrow at the top and as wide as necessary at the bottom. When pants have become baggy at the knees, clean them thoroughly, then wash out all the soiled places. Turn the pants wrong side out and lay them on the ironing table with the wrong side up. Lay a wet cloth over all the knee portions and press until the cloth is dry, then turn right side out, fold in the center and press from top to bottom over the damp cloth.

When coat, pants or vest have become much soiled, the better way is to wash the garment in strong, hot suds, as much cleaning of grease spots will leave visible marks, and washing gets rid of all dust and leaves the cloth fresh and clean. There is nothing better for washing cloth of any color than hot suds made with borax soap chips, but it is best to dissolve the chips in hot water then stir enough of this soap solution in the hot water to make a strong lather. If a garment is very soiled wash through a second suds made with the soap chips then rinse through several waters, all hot, and hang them out without wringing. Keep them pulled into perfect shape while drying and they will dry without wrinkles and be easy to iron smooth.

Sweaters of any color come out soft and clean by washing them through warm suds made with the borax soap chips. This suds is especially good for washing socks and both the white and colored shirts. White garments are improved by soaking in the suds, but the colored pieces should be washed and rinsed as quickly as possible, and sweaters should be pulled into shape and pinned to a sheet, and when securely pinned, hang the sheet over the clothesline and the garment will not stretch out of shape.

FASHIONS IN FEZES

The stream of people crossing the Galata bridge, over the Golden Horn, runs red, for every Ottoman, except the Arab, must wear the tarboosh. "The man with a hat" means the foreigner. The way to see Constantinople without attracting attention to yourself is to slip on a tarboosh; but the wise foreigner has been slow thus to surrender the one visible token of his special extra-territorial rights, for when trouble is afoot the word goes out to spare "the man with a hat," because of the fear of international complications. During the reactionary revolution that followed on the heels of the constitution there was a ludicrous scramble on the part of the Greeks and other Christians to get beneath hats—and the sudden cloy of silk hats and derbies was wonderful to behold.

Fashions in fezes pass in review across the bridge. The Albanian has a white headdress—a cross between a fez and a skullcap. The Persian wears a huge black felt dome that is matched in size only by the big brown bulb that crowns the head of the dervish. The hadji, whose merit in having made the haj, or pilgrimage, to Mecca is proclaimed by his huge turban, is a frequent figure on the bridge, for every Moslem man who has the

means and the physical strength is expected to visit the birthplace of the Prophet at least once in his life. The elaborately wound headdress of the hadji is of white cloth, but a sayid's, or descendant of Mohammed, is of green. Sometimes the mosque officials, or imams, even when they are not of the Prophet's blood, wear the green turban.

Only the men wear any sort of headgear. The Oriental woman goes hatless. A cloth or veil is as much covering as she wears on her head. As I stood there on the bridge I saw a group of Turkish women stare through their thick veils at the hat of a foreign woman, as she hastened by. Since Young Turkey has come into power western fashions are much in favor in Constantinople.—William T. Ellis, in The Youth's Companion.

HOUSEHOLD QUERIES

Chayote Recipes

Please publish recipes for preparing the chayote for the table most palatable.—Subscriber, San Ysidro.

A grower and user of chayotes tells us that they are prepared for the table in identically the same manner as are summer squash, eggplant, and this class of vegetables. When young and tender it is unnecessary to peel the chayote, but when the skin becomes thick and tough it should be removed. This vegetable may be sliced, crumbed and fried, escalloped, stuffed and baked, creamed, served au gratin, etc. We give some tried recipes which will apply equally to each of the three vegetables mentioned:

Italian Methods of Serving:

Cut in slices, broil, and serve with seasoned, melted butter.

Cut in halves lengthwise and broil until soft, scoop out the inside and mash with a little finely minced salt pork, fried brown, minced onions, mushrooms, salt, pepper and bread crumbs. Fill the shells with the mixture, sprinkle with crumbs, baste with oil, sprinkle grated Parmesan cheese over the top and bake brown.

A simple and most delicious manner of cooking them is to cut the vegetable in two, score both sides, season with salt, pepper and a tablespoon of butter to each half and bake until soft, basting with the gravy which runs from them. Send to the table in the dish in which baked.

Fried.—Peel and slice the eggplant about one-eighth of an inch thick, sprinkle with salt and allow it to drain for an hour or more. Dip in beaten egg and flour, or in bread crumbs, and fry in hot butter or lard. Eat while hot.

FATHER HAD A GUN

"If you kiss me again," declared Miss Lovely, firmly, "I shall tell father."

"That's an old tale," replied the bold, bad young man. "Anyway, it's worth it," and he kissed her.

Miss Lovely sprang to her feet. "I shall tell father," she said, and left the room.

"Father," she said softly to her parent when she got outside, "Mr. Bolder wants to see your new gun."

"All right, I'll take it in to him," said her father, and two minutes later he appeared in the doorway with his gun in his hand.

There was a crash of breaking glass as Mr. Bolder dived through the window and departed in all haste for the railway station.—Ladies' Home Journal.

WILLIE'S CONFESSION

Willie had been very naughty, so much so, in fact, that after having reproved him several times his mother was at last forced to severely punish him.

When his father arrived home in the evening he at once perceived that Willie's eyes were suspiciously red.

"What's the matter, sonny?" he cried.

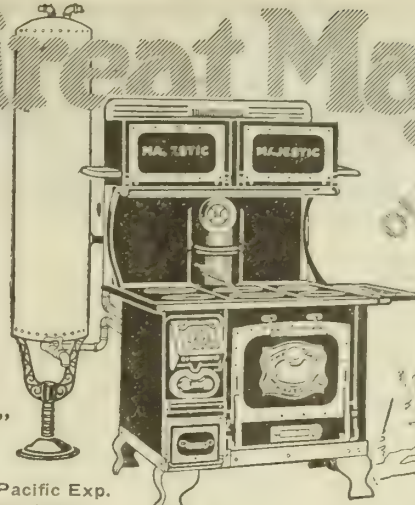

"Oh, nothing," responded Willie, uneasily.

"Come, don't be frightened," said the father in coaxing tones. "Tell me all about it; I want to know."

Willie remained silent for some time, then he suddenly burst out:

"Well, if you must know, I've had a thundering row with your wife."

"Old Faithful"—in the kitchen.

A Majestic Range in your kitchen is not merely something to cook with—it's a faithful, silent partner that lightens the work and lowers the cost of cooking.

Faithful in performance—it bakes right always; so built that heat is uniformly circulated to all parts of oven; and a heavy asbestos lining reflects the heat onto all surfaces of baking—top, sides, and bottom. Its big, copper tank, with pocket inset against lining of firebox is, like Old Faithful Geyser, continually bubbling with hot water.

Faithful in fuel economy—its scientific construction puts fuel to the fullest use; distributes the heat to all cooking surfaces and

holds it inside—heat can't escape and be wasted, for cold-riveting (no bolts or clamps) makes the Majestic practically and permanently airtight.

The Majestic is made of non-breakable, malleable iron and charcoal iron which resists rust three times as long as steel.

You'll not hesitate to pay the little higher Majestic price, when you know its economy in use, and the way it outwears three ordinary ranges.

There is a Majestic dealer in nearly every county of 42 States—if you don't know one, write us.

One quality, many styles and sizes, with or without legs.

Write for Book.

Tells what to look for and what to avoid when buying a range. You can't judge a range by looks. You should know how they are made and why. Write for free copy

MAJESTIC Manufacturing Co., Dept. 203, St. Louis, Mo.

DRIED FRUITS

Wholesale Prices are:

PRUNES—Local selling price, bulk basis, in carload lots, 1915 crop: Santa Claras, 3 1/2 c. All outside sections 1/4 c lower.	
Other Fruits. Stand—	
50-lb. boxes	ard. Choice Choice Fancy
Apricots	6 3/4 c 7 3/4 c 8 3/4 c 9 c
Peaches	3

in previous years, showing the result of the short crop. Alfalfa is scarce with very little coming in from river sections and that which is shipped in from the interior is of poor quality and undesirable. A good grade of alfalfa will sell readily at quotations. Straw is in light supply and with a demand equally light.

We quote the average wholesale price of hay in carload lots on today's market as follows:

Fancy Wheat Hay (14 bales)	14.50@16.00
No. 1 Wheat or Wheat and Oat	12.00@14.00
No. 2 Wheat or Wheat and Oat	8.50@11.00
Choice Tame Oat	12.00@13.50
Other Tame Oat	9.00@11.00
Wild Oat	7.00@10.00
Alfalfa	10.00@13.00
Stock Hay	6.00@7.00
No. 1 Barley Straw	25@40

GRAIN

Alfalfa Seed	16 1/2

Oilcake Meal	37.50@39.00
Cocoanut Oilcake Meal	23.00@24.00

Citrus Fruit Market

LOS ANGELES, Oct. 6, 1915.

A slightly easier feeling is manifested in the orange market. This is perhaps because of heavy supplies of peaches in part, but more because of the large number of new crop Porto Ricos and Jamaicas being received at Atlantic points. On Monday there were 4025 boxes of Porto Rico oranges sold on the New York docks. A slight shading in price, probably not over 15 to 25 cents, is to be noted. The demand for Californians, however, is good. A shipment of 310 boxes per week will clean up before the first of November.

A good demand for lemons has nearly cleaned up the large supply in California storerooms. There are probably not over 200 cars stored at this writing and these are being shipped as rapidly as possible. In addition the new cutting is being shipped daily. The surplus stock will be cleaned up within the next 30 or possibly 60 days. The prices are running at the present time around \$2.50 to \$2.90.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914, 32,349 carloads, lemons 6566, total 39,915. To same date last season oranges 37,441, lemons 2777, total 40,218. Tulare County this season, oranges 5651, lemons 204, total 5855. No shipments have been made from Northern California points for the past two weeks.

NEW YORK, Oct. 4.—Ten cars Valencias, one car lemons and one mixed car sold. Valencias fully 25 cents higher; lemons unchanged. Weather fair.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department. Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115 1/2 N. Broadway, Los Angeles.

Street Improvement

In cities of the sixth class have the board of trustees the right to improve a street, against the protest of a majority of the foot frontage on the street to be improved, should they deem it necessary for the best interest of the city to do so, and have the protestants a "day in court" should the trustees so decide?

If a petition having a majority of the foot frontage on a certain street is presented to the board of trustees for action, which they refuse or fail to take, does such refusal invalidate the petition or does it hold good as long as it is in their hands? Has a person signing a petition a right to protest the same, in case the trustees decide to take favorable action on same? After a petition has been filed with the city clerk can a person signing same erase his name?—Subscriber, Manhattan.

There are a number of different acts under which streets may be improved and it is therefore impossible to give a clear, definite answer to any one of the questions herein. Under at least one of the acts a protest of the majority of the foot frontage of a street to be improved absolutely kills the proposed improvement. On others of the acts the city council have the right to decide to improve a street over the protest. However, protestants may always bring the actions of the city

council into court by divers methods as may be particularly applicable to the case in question. In one or two of the acts a petition of the majority of the foot frontage is necessary to institute action, but generally speaking the petition is without legal effect other than to bring the proposed improvement to the attention of the council and is not in itself a recognized part of the proceedings; therefore the council could not be compelled to take action; your only remedy would be to elect a new council but it would seem that a petition in the usual case would be good for reasonable length of time. From the fact that a petition has no jurisdictional element in the institution of proceedings a person signing such petition would very probably have a right to protest the same, as protests are specifically provided for in the majority of the laws and may cause the council to lose jurisdiction to proceed. Upon the theory that a petition is not a legal requirement of the law, a person could undoubtedly erase his name from the petition at any time. But in any case where a petition would be necessary to vest a council with jurisdiction it would seem that it would be unlawful for the person to erase his name after petition has been duly filed. As above stated there are so many different street laws and so many different situations applicable to each that the above must be considered merely as a general statement and cannot be relied upon in any particular case.

Transaction on Sunday

A. demands from B. money due him on account on a Sunday. B. gives note dated on a Sunday to A. Is above transaction legal?—Subscriber, Chino.

A note executed upon Sunday or any other business transaction performed upon Sunday is perfectly legal within this state.

Care of Orchard

A sold a piece of young lemon orchard to B with a little cash, balance mortgaged for three years. A foreclosed the mortgage and bought the orchard back through the court. B has a right to stay one year after foreclosure as I am told. The trees have been neglected and will soon die if not watered and cultivated. How can the trees be saved? Has A a right to step in?—Subscriber, Chula Vista.

A has two remedies; by one he may have receiver appointed to take charge

of the property and preserve it from neglect, by the other he may procure an injunction to restrain the doing of any act to the injury of the property, before the sheriff's deed of conveyance. Either one of these remedies, as may be most applicable, can be obtained by filing an affidavit setting forth the facts with the court in the foreclosure case, thereupon procuring the appropriate orders. It will be necessary to have an attorney attend to the matter for you, as the average layman would not be able to draw the proper papers.

Using Patented Articles

I have often seen the statement that the patent laws permit anyone to manufacture and use patented articles for their own use. Is this correct? If so, may a patented process or method of handling fruits or nuts be used by the individual orchardist for nuts or fruit to be used in his own home or in case the same are to be sold?—Subscriber, Los Angeles.

The making of a patented invention for an amusement or scientific investigation, with no intent of using it, is not an actionable infringement, but it is otherwise where the thing may be sold or is put into actual use. The owner of a patented process can by injunction restrain anyone from making or using his process, except by his license, as that is the element constituting the monopoly of the patentee. If the patentee should bring suit to obtain damages for the infringement, he could only obtain the actual damages sustained by him during the time of the infringement for which the suit was brought. So that from a practical standpoint people do sometimes violate the rights of a patentee and use patented articles with impunity, but they have not the legal right.

State Support for Child

If widow without means is trying to care for a grandchild which has been forsaken by both parents, can she obtain aid from the state?—Subscriber, Winton.

In 1913 a commission was appointed to investigate mothers and old age pensions, but nothing has as yet been done. Under subdivision 23 of what is known as the juvenile court act a provision is made for the maintenance of a dependent or delinquent person out of the county treasury to the extent of \$11 per month, so that if you would take the matter up with the probation officer of your county you could probably receive relief under the act.

The Most Economical and Efficient Pump on the Market

Pomona Deep Well Pumps

For more than 12 years we have been building and selling Pomona pumps here in California and hundreds of users will attest their worth. No pump can equal the Pomona for deep lifts, as well as shallow lifts combined with high heads above the surface and through long pipe lines.

(My commission expires March 19, 1917.)

The most independent man on earth

The G-E electric motor has freed the modern farmer from the shackles of drudgery and made him the most independent man on earth. He is no longer "bound to the land" by daily chores that occupy all his time to the exclusion of other interests. If YOU use

G-E ELECTRIC MOTORS FOR RANCH AND FARM

you can do your chores in a small fraction of the time they now take by hand. Costs are low, too.

For less than half the cost of an extra "hand" you can have your cows milked, your cream separated and the real work of all your other chores done electrically.

G-E motors will drive threshing machines, feed cutters, hay hoists, corn shellers, grindstones and all dairy, household or farm repair shop machinery.

G-E motors will pay for themselves many times over by saving time, labor and wages.

LOUDEN

BOOK OF BARN PLANS FREE

If You Intend to Build a New Barn or Re-model an Old One You Should Have This Book

Louden Barn Plans is not a catalog of barn equipment. It is a complete and valuable book of reference and instruction on barn construction.

The 96 pages of Louden Barn Plans are full of dollar-saving information. It contains 51 representative designs for cow barns, horse barns, combination and general purpose barns, as well as many other designs for hog barns, pens, hay sheds, chicken houses, etc.

In addition to the barn plans shown in the book, there are 32 pages devoted to general construction problems, such as concrete work, laying floors, roof construction, ventilation, etc.

When Writing for This Book Please State When You Expect to Build, and How Many Cows and Horses You Want to House

We have designs for nearly 4,000 barns, and our architects will give your letter personal attention if we learn your exact requirements.

Louden Barn Equipment
Louden equipment makes possible a clean, sanitary barn with a minimum of expense. When cows are transferred from dark, dirty barns to Louden barns the milk flow often increases from 15 to 25 per cent, and the labor of caring for the herd is reduced from one-third to one-half. Louden equipment is just as great economy for the man with a half dozen head of stock as for the man with hundreds of animals. The percentage of labor saved is the same.

The Louden Line of Sanitary Steel Equipment Includes:

Litter Carriers	Cow Stalls	Hay Loft Equipment	Sheep Pens
Feed Carriers	Horse Stalls	Cow Pens	Water Basins
Milk Can Carriers	Mangers	Calf Pens	Bird Proof Barn Door
Harness Carriers	Manger Divisions	Bull Pens	Hangers
Hay Carriers	Feed Racks	Hog Pens	Power Hoists and
Feed Trucks			Other Barn Specialties

**'Jackson
MADE'**

**For Water Deep Under
The Ground**

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

LOS ANGELES: THURSDAY, OCTOBER 14, 1915

One Dollar Yearly

Land Settlement and Lower Interest Rates

Dr. Elwood Mead for the California Rural Credits Commission Gives Reason for Better Methods and Lower Interest Rates for Farmers.

At the recent rural credits conference at the closing session of the International Irrigation Conference in San Francisco it was deemed wise to organize a committee to prosecute a campaign for rural credits legislation at the next session of the legislature. This committee is now getting into action. Meantime the rural credits commission appointed by Governor Johnson has formulated a statement through one of its members, Dr. Elwood Mead. This commission consists of Dr. Elwood Mead, professor of rural institutions, University of California, and for many years in active charge of rural credits and land settlement operations in Australia; Dr. David P. Barrows, dean of the faculties of the University of California; Col. Harris Weinstock, member of the industrial accident commission of California, and one of the representatives of this state on the commission on rural credits and agricultural finance that made a study tour of Europe in 1913; State Senator William E. Brown, of Los Angeles, and Mortimer Fleishhacker, a prominent financier of San Francisco. The statement endorsed by the commission is as follows:

* * *

THE act under which this commission was appointed requires it to investigate and consider "the question of land colonization and the various forms of land banks, cooperative credit unions and other rural credit systems adopted or proposed in this country or elsewhere, with a special view to the needs of the rural communities of this state." It must make a report to the governor on or before October 1, 1916.

The commission believes that the first step in this investigation should be to ascertain what is needed to promote the development and prosperity of rural life in California. To this end it intends holding public hearings in different sections of the state, which all interested in the subject are invited to attend and give evidence. These hearings will be begun in Sacramento on September 29 and will continue until the commission feels that it is fully informed regarding the causes which are now operating to retard the settlement and improvement of the state's agricultural lands and has given all who have suggestions to offer an opportunity to be heard.

No state has more to gain than California from improvement in methods of land settlement or from the adoption of a system of rural credits.

Notwithstanding its great natural advantages of climate, soil and wide range of products, there has come a halt in rural development. Over 1,000,000 acres of land susceptible of irrigation is uncultivated and awaiting settlement. Another million acres could be irrigated if a demand for land and water was assured.

The settlement and cultivation of these lands is needed to insure the continued growth and enduring prosperity of our cities. We ought, in this state, to produce more meat, butter, cheese and wool. We need more farms devoted to raising horses, cattle, hogs and sheep. The alfalfa fields need to be extended and the live stock grown thereon multiplied.

This cannot be hoped for until existing obstacles are removed. Interest rates must be lowered, the time for repayment of loans must be extended and more than all else there should be some organization that will give aid and direction to beginners so that unimproved land may be converted into habitable and productive farms with the least possible effort and waste of money and time. We want to attract the young, virile and ambitious. We want to keep the red blood on the farm. We are not doing these things now. A recent investigation of the

University of California showed the average of settlers in new developing districts to be about 45 years. Men ready to retire from active life buy farms; the boys and girls flock to the cities.

A recent report issued by the United States government shows an increase of 380,000 in the population of California during the last five years. Seventy-three per cent of this increase was in cities and towns of 8000 and over. The increase in farm population was so small as to cause anxiety and lead to a belief that changes in existing methods are desirable.

Selling land to settlers has become so difficult that commissions to land salesmen have reached the incredible figure of 25 to 30 per cent of the selling price. Reliable men engaged in the business say that even with these extraordinary commissions they are not prospering. When one considers the attractions of rural life in this state there is no other conclusion except that this halt in development is due to vital defects in our policies.

Two such defects are plainly apparent. Both are susceptible to removal if we set about it. The first is absence of aid and advice to settlers in the purchase and improvement of farms. The second, the high interest rates, the short time of repayment of loans and in many cases the inability to borrow money on any terms.

The farmers and settlers of California who have to borrow money pay more than double the average interest rate required of farmers in countries which have a rural credit system. Agriculture cannot develop under this handicap.

Below we give the interest rates paid by settlers in countries which have a rural credit system. They show the great disadvantages which California farmers labor under and also make apparent what an impulse would be given to rural development if we had such a system here:

Country—	Rate of Interest Per Cent.....	Time Given for Repaying Loan
Denmark	3	65 Yrs.
Italy	2.5	50 Yrs.
Holland	4.7
*Norway	3.5
Hungary	4	50 Yrs.
xRussia	4.5	55½ Yrs.
Austria	4 to 4.5	54½ Yrs.
Germany	3.5 to 4	56½ Yrs.
*France	4 to 4.5	75 Yrs.
Ireland	3	30 to 50 Yrs.
Spain	5 to 7
Belgium	4.5	30 Yrs.
Switzerland	4.5	57 Yrs.

(To enable farmers to buy land, and 4 per cent to those who own land.)

x(To cover both amortization payment and cost of administration.)

°(To enable young farmers to buy farms 2.5 to 3 per cent.)

The following list includes countries with less development, less accumulated wealth, less population than the United States, and consequently less able to provide low interest rates:

Country—	Rate of Interest Per Cent.....	Time Given for Repaying Loan..
New Zealand....	4	36½ Yrs.

Victoria, Aus...	4.5	36½ Yrs.
New So. Wales	3 to 5	30 to 40 Yrs.
Other Austral- ian states	4 to 5	30 to 40 Yrs.
British and German So.
Africa	4
Chile	4	33 Yrs.
Argentine	4
*British Colum- bia	36½ Yrs.

*(One per cent more than the interest on state bonds.)

The farmers of California with no rural credit system pay from six to 12 per cent interest on loans running from three to ten years, and often with excessive commissions for securing the loan or its renewal.

The introduction of rural credit systems in other countries has in every case been a financial success and a benefit to all classes of people. It has extended the area of land cultivated, increased the acreage yield, led to the building of better houses and to rendering the social life of the farm more attractive, has tended to keep the boys and girls on the farm and check the drift to cities and to other countries. Nowhere has it been either

an agricultural or financial failure, and these great results have been accomplished in each case without any disturbance or loss to the existing commercial banking institutions. Australia has perhaps the most liberal and most highly organized rural credit system of any country, but the introduction of this system has not injured the commercial banks. They have been more prosperous since its introduction than before; not a single bank has failed and the dividend rate last year varied from five and one-half to 14 per cent with liberal increases in their reserves.

It is hoped that out of this investigation there will come some plan that will give the farmers of this state the same credit advantages that are enjoyed by the farmers of other countries, either through the use of the state's credit or through improvements in existing banking facilities.

It is believed that what other countries have done this state should do, and that it only requires an understanding of the subject and the cooperation of all classes to be benefited to bring about the desired results.

Sacramento Sale of Pure Bred Holsteins

164 Pure Breds Command \$75,000. Spirited Bidding and Fair Prices, Though One or Two Animals of High Degree Sold Lower Than Expected. By W. S. Guilford.

THE sale of 164 head of Holsteins from the herds of A. W. Morris & Sons, Woodland, and J. W. McAlister & Son, Chico, was held at the State Fair Grounds, Sacramento, October 6-7, 1915.

Whether or not a sale of pure bred cattle is to be considered a success depends on a number of things. Some of these are the prices secured, the quality of the cattle, the purchasers, the status of the pure bred industry of the territory in which the sale is held and general business conditions.

With all of these things in mind it can be honestly and emphatically stated that this was one of the greatest sales of pure bred animals ever held. The price was not the highest ever secured for a large number of Holsteins, but it ranks with the best; a very superior lot of individuals, royally bred, were sold; they were bought by discriminating buyers who know values and who will by constructive breeding add glory to the breed and to the districts to which they go; the sale was held in a territory where the pure bred industry is more or less in its infancy so far as number of breeders is concerned as compared with some districts in the Eastern states; the money market is tight, to say the least, and general business conditions are not such as warrant large expenditures.

One hundred and sixty-four head sold for about \$76,000. The average per head was \$459.

Some of the high prices paid were: \$2500 for Aralia De Kol Pontiac Mead, by S. C. Renaud of Phoenix, Arizona, which price was considered

a bargain. The calf is a beautiful six months old, almost all white, and with a long line of heavy milk and butter producing ancestors; \$1550 by F. J. Kiesel of Sacramento for Jane Korn-dyke of Riverside, a cow with a record of 31 pounds of butter in a week; \$1150 for Helen Nye Skylark by F. J. Kiesel (this is another record cow, having over 28 pounds of butter in a week to her credit); \$1500 by Alex Whaley of Tulare for Segis Pontiac De Kol Burke III, a calf born in February, 1915; \$1500 for Winnie Korndyke Cornucopia De Kol, a 25-pound record cow, by the J. S. Gibson Company; \$1150 for Unedea Korndyke Abbie, a 28-pound cow, by the J. S. Gibson Company; \$2000 for the five-year-old herd bull, King Segis Pontiac Emperor, by H. E. Cornwell, Modesto; \$1000 for Segis De Kol Pontiac Burke, a bull just past a year old, by W. G. Stimmel, superintendent of the Vina Ranch of the Stanford University at Vina.

The high prices were paid for cows with high butter records and young bulls from ancestors with high records.

The J. S. Gibson Company, Williams, bought 13 head for which they paid \$9150.

F. J. Kiesel, the prominent Sacramento banker, farmer and stock grower, bought a number of the choice things of the sale.

J. M. Henderson, another Sacramento banker and farmer, bought a great many.

W. H. Taylor, formerly of the Whit-tier school herd, but now manager for Mrs. Anita Baldwin of Los Angeles,

More HOP Profits More Bales per Acre

Hop Growers who have taken advantage of our free service department have found it profitable. They have made money through our advice. We have shown them how to increase the number of bales per acre. What we have done for others we will do for you. Write us fully and frankly. Let us know the exact conditions you are working under. Send a sample of soil and we will tell you how we can help you. You will not be obligated in any way. We want every Hop Grower to know all about

HOP
BRAND

Gaviota Fertilizer

How it increases land values while increasing the land's yield. We want to send you positive proof of the wonderful increases it has made. How it feeds the crops and improves their quality.

Read what Hop Men Say:

From a Grower in Sonoma County:—"After using HOP Brand for two years, I am thoroughly well satisfied with results both in production and quality."

Another Sonoma Hop Grower:—"I began using your HOP Fertilizer in 1911 and increased my yield from 180 bales to 378 bales."

From Sacramento County:—"I purchased HOP Fertilizer last year and have had splendid results."

Still Another From Sonoma County Says:—"HOP increased my crop from 8.36 bales per acre to 13.14 bales."

We will furnish the names of these men on application.

"The Care and Feeding of Crops"

is a little book that tells you in plain English some valuable truths about the correct way to put back into the soil those elements which the crops take out. It tells you how to increase the size of your crops and how to make your land more productive. Write today for a copy free.

POTASH FROM THE PACIFIC

IN issuing a statement as to a new bulletin (No. 150) touching upon the supply of potash the department of agriculture writes:

"Any scheme for using kelp on a large scale as a fertilizer must be based on some method of concentrating its valuable constituents, because green kelp contains so much water. Investigations seem to show that at present, considering the economic conditions on the Pacific Coast, kelp may be best prepared for the trade merely by drying and grinding.

"Even wet kelp, which contains 85 per cent moisture, contains two and one-half per cent of potash, where stable manure, alfalfa, and cowpeas all contain less than one per cent. Drying, however, increases the percentage of potash to 15.8 per cent. This commercial product also has 1.6 per cent of nitrogen and some phosphorus. On the retail market of the Pacific Coast the total value of a ton of kelp should be, according to estimates, \$22.94. In the Eastern wholesale market it should bring \$16.45.

"The main fertilizers termed potash carriers today used in this country are the German potash salts. Laboratory tests have shown that kelp is quite as effective as the potash salts, and dry kelp would enter the trade as a 'potash carrier' to compete with the imported products."

"Kelp has been used as a fertilizer for centuries in the British Isles and has been so valued there that lands carrying kelp-harvesting privileges brought special prices. In New England also kelp has been found valuable. The kelp on the Pacific Coast differs from the seaweeds of the Atlantic because of its much greater size. Already this product of the sea gardens of the West has been used in Alaska, particularly in fertilizing potatoes and on truck gardens. Near San Pedro kelp has been harvested mechanically and shipped in the crude, undried condition to the ranches and orchards of that part of the state.

How Kelp Must Be Prepared

"The new bulletin of the department goes into considerable detail in describing how kelp should be harvested, dried, and ground into a coarse powder for bagging and mixing.

"Since the ingredients of kelp are either neutral or beneficial in their influence on plant growth, to prepare kelp for use as a fertilizer it is necessary only to convert it into a form in which it can be preserved and shipped. To accomplish this it is sufficient to harvest, drive off the water which it contains and grind it to a coarse powder for bagging and mixing.

"Kelp is harvested by a machine which embodies the principles of the mowing machine or reaper used in harvesting agricultural products. The harvester actually in operation consists essentially of a barge over the end of which projects an adjustable frame, supporting an endless belt, tilted to form an inclined plane. Across the lower end of the belt extends a horizontal cutting bar about ten feet in length, of the type used in the construction of reapers, which is supplied

at each end by two perpendicular knives. By this arrangement a swath may be cut through the kelp ten feet in width and of a depth determined by the adjustment of the supporting frame. Back of the knives the belt, constructed of chains and netting, is operated in such a way as to catch the severed kelp and lift it upon the barge. Beneath the upper end of the belt is a chopper into which the kelp drops and by which it is cut into short lengths. From this it passes onto a short conveyor which loads it into a large scow made fast alongside. The small barge carrying the cutter is moved along the side of the large scow so that the load of cut kelp is distributed evenly. To operate the moving parts of the machine a gasoline engine is provided. The barge and scow are pushed through the kelp groves by a launch, which serves also to tow them to the dock for unloading.

"The cost of cutting will be determined by the conditions obtaining at the place of cutting. The results obtained so far indicate that this will be not more than 50 cents per raw ton, and easily may be reduced to 25 cents or less, inclusive of unloading at the dock.

"It can not be expected that the cutter now in operation embodies all the perfections to which such a machine is susceptible, or that improvements in the machine will not reduce the cost of cutting. Certain features of the present method of operation are objectionable, but these almost certainly will disappear when a fuller experience shall have pointed them out and

the means of circumventing them. Cutters of other forms and modifications of the present cutter have been designed and patented. In spite of its imperfections the kelp cutter now in operation must be regarded as an unqualified solution of the problem of the economical harvesting of kelp.

"The chopped kelp may be unloaded at the dock by an elevator such as may be used in unloading cannery waste.

"Since, under Atlantic Coast conditions, fish pomace containing 55 to 60 per cent water may be dried in the direct heat rotary drier at a cost of about 50 cents per dry ton, it seems reasonable to believe that it should be possible to dry kelp, containing 85 to 90 per cent water, at a cost of \$1 per dry ton. After drying it may be found desirable to grind the kelp for mixing. Dry kelp, especially when hot, is quite brittle and grinds easily."

OLIVES MEAN MILLIONS

Little was known in this state about olive culture until 1909. Three years later the production was estimated at 1000 tons per annum, which grew to 4000 tons in 1914 and 7000 tons in 1915. Of this year's crop perhaps 1000 tons has not been consumed and at the rate young trees are coming into bearing and new acreage is being planted the urgent need of increasing the demand and providing marketing facilities is apparent. A majority of the olive trees in California today are less than ten years old. Olive trees increase in bearing productivity up to 75 years of age.

There are something like 2000 acres of new trees coming into bearing each year, which, in ten years, will produce 6000 tons of fruit per year to be added to the present production. The problem is not at all alarming when the possible consumption of the fruit is considered. The ripe olive is a food, not a relish nor a luxury. Analysis proves that ripe olives contain half the food value of butter.

If every family in the United States were to place one single ripe olive on the dinner table each Sunday in the year, the present production would be entirely consumed and the normal increase in the country's population would keep pace with the normal increase in olive production. At the present time the consumption of ripe olives in the East is practically nil because the knowledge of the delicious, health giving, and food properties of the fruit is very limited. Practically the entire production is consumed by the 5,000,000 inhabitants of the Pacific Coast. Should the consumption of ripe olives throughout the country be increased to the same ratio as prevails on the Pacific Coast, our present production would only be about one-twentieth of the demand. That would mean high prices to the grower for the fruit and tremendous increases in the value of olive lands.

One explanation of the present low consumption of ripe olives even on the Pacific Coast is to be found in the high price charged the consumer for the fruit, putting it in the luxury class and out of the reach of the masses. Figured at the "per order" or per package price paid by the diner in the cafe, ripe olives are costing the consumer from \$2000 to \$5000 per ton. Yet the grower who gets \$150 per ton is indeed fortunate.

"The solution of the growers' problems, and they are serious problems crying for immediate solution, lies in organization. More scientific methods must be encouraged looking to the pro-

duction of more and better grades of fruit. Standardization of sizes and packing methods demands attention. An intelligent campaign of educational publicity must be inaugurated throughout the country to teach the people to eat ripe olives daily as a standard food of high nutritious and medicinal value. The question of whether present independent packing facilities shall be utilized or cooperative local plants established bears consideration. Methods of distribution and sale must be considered, in order to keep the price to the consumer as near that received by the grower as the cost of efficient selling machinery will permit.

FUNGUS DISEASE MEETINGS

The Riverside citrus experiment station has arranged a series of meetings for the latter part of this month. Fungus diseases are to be discussed, brown rot, gummosis, scaly bark, wither tip and fruit spots.

On Monday, October 25, there will

be meetings at Porterville addressed by Dr. Barrett and at La Verne, by Prof. Fawcett. On Tuesday, October 26, Dr. Barrett will speak at Lindsay and Prof. Fawcett at Ontario-Cuamonga; Thursday, Oct. 28, Villa Park, Prof. Fawcett; Friday, Oct. 29, Whittier, Prof. Fawcett, Redlands, Dr. Barrett.

AHUACATE ASSOCIATION

The California Ahuacate Association will hold its first general meeting at Hotel Alexandria, Los Angeles, October 23. The program will begin at 9 o'clock a. m. and continue to 4:30 or 5 p. m. with an intermission for lunch hour. Everyone interested in the ahuate (avocado) is invited to be present. The arrangement for speakers guarantees an interesting and instructive program and includes among other speakers such men as Dr. J. Eliot Coit, Prof. I. J. Condit and Prof. M. E. Jaffa, all of University of California; H. J. Webber, of state experiment station at Riverside; David

Fairchild, head of foreign seed and plant introduction, bureau of plant industry, and Wilson Popenoe, agricultural explorer, bureau of plant industry, United States agricultural department; Judge Charles Silent, of Glendora; C. P. Taft, of Orange; F. O. Popenoe, of Altadena; John C. Bosche, importer and exporter of ahuates, formerly of Mexico City; E. B. Rivers, of firm of Rivers Brothers, importers and exporters of fruit, and Edwin G. Hart, president of the association.

An exhibit of mature fruit will be an attractive adjunct of the meeting. The association is endeavoring to get into communication with all who will have fruit at that time and will take it as a favor if anyone having fruit will write or telephone to Edwin G. Hart, 917 Union Oil building, Los Angeles. The association is also desirous of securing 500 or more ripe or nearly ripe thin skin fruit for experimental work in which the University of California has agreed to cooperate.

Tires 20% Larger

In Sizes 30x3½ and 30x3

30% More Rubber at the Rim

Here is the best piece of news we have ever announced to users of small-size tires.

A few months ago we announced a big price reduction. It will save Goodyear users some five million dollars this year. It brought our total reduction in two years up to 45 per cent.

But here is something better still. We have held the announcement until every Goodyear dealer was supplied with the new-type tires.

Three More Extras

This year we built new molds for Goodyear small-size tires. Our experts found a new design which increased the tire's endurance.

In making these new molds we increased the air capacity of these small-size tires by an average of 20 per cent. That means extra mileage—just as a 4½-inch tire gives more than a 4-inch on the same car.

And we added 30 per cent to the side-wall rubber, at the rim. That's where constant flexing and chafing break so many thin-walled tires.

These new extras cost us \$317,000 on this year's small-tire

output. They will save our users, beyond doubt, at least ten times that much.

No Question Now

Note that these bettered tires are Goodyears, the dominant tires of the world. For years, because of super-merit, they have outsold any other.

Even size 30x3 has long been a four-ply tire. And the All-Weather tread, since its adoption, has been made double-thick.

Now we enlarge these tires by 20 per cent. We give you an improved design. The side-walls are made 30 per cent heavier at the vital points. And our prices this year were immensely reduced.

Now there can be no reasonable question about Goodyear superiority. If you have such a question, make a comparison. You owe that to yourself.

The added mileage will vary. Mishap and misuse, the roads and the loads affect it. But it must, on the average, vastly excel smaller and thinner tires. You know that.

Every neighborhood has a Goodyear Service Station with your size in stock, which renders full Goodyear service. Look it up.

THE GOODYEAR TIRE & RUBBER COMPANY, AKRON, OHIO
Makers of Goodyear "Tire Saver" Accessories; also Goodyear "Wing" Carriage Tires and Other Types

"KT" Screw Lift Gate (Type W).

Modern Irrigation Methods

This Company originated the Valve System of Irrigation—which completely revolutionized the methods then in vogue. Ever since that time, our motto has been—"When better gates and valves are made, K-T will make them." In line with this policy, we have finally evolved the K-T Type W Gate—illustrated above—the acme of perfection in irrigation appliances.

You cannot afford to experiment in irrigation. Profit by the experience of men who have devoted a lifetime to the business. Our advice is free. What would you like to know?

CARING FOR THE WALNUT BUDS

Written for California Cultivator
By Claud D. Tribble

LL buds used in a field nursery are or should be placed on the north or northeast side of the tree, and it is a very good rule to plant the budded tree in the orchard in the same position in which it grew in the nursery row. In July and August budding, some of the buds may start; if so these must be tied to the stock above the bud to make it grow a straight tree, otherwise if this should grow out or downward without any attention, the wood becomes hard and will break in trying to pull it into place the following spring.

After all stocks are stubbed off in the spring prompt attention must be given in staking, otherwise the tree will be crooked. We place the stake on the southwest side of the stock and bring the bud to this, using sisal or Manila binder twine and tying loosely to prevent the growth from cutting off the tree, as it would do if tied tightly against the stake. Stakes of about three and one-half feet are tall enough for nursery purposes and they can be as small as three-quarters of an inch by three-quarters of an inch, as it does not take a strong stake to support the tree. The method of budding described in the Cultivator of September 16 is very successful in top working large trees where the tops have been cut off and new growth trained and grown properly, and practically the same care of the buds is required. Laths about six feet long are nailed to the trees to support the growth. The growth of these must be tied loosely to prevent the string from cutting off the growth, and the buds should be trained in the proper direction by tying along the lath about two feet apart. Do not tip the bud in a top worked tree as it prevents the tree spreading as it should and causes the bud to throw out a mass of small limbs and prevents the proper heading of the tree. In heading a top worked walnut tree make the main limbs grow as far out or as tall as possible to make a broad top, as most of the walnuts are produced on the outer part of the tree and the more surface given the larger the crop.

In the past three years the red hump-backed caterpillar and a smaller caterpillar have worked on the foliage of the walnuts and other trees and they are becoming so numerous that they check the growth of a tree. These can be killed by an arsenical spray, but it is usually cheaper to have a bucket of distillate and go among the trees, cut off the leaves they are on and dip them in the distillate. These insects colonize on one limb at a time and often on one or two limbs, thus they are easily taken from the tree.

SACRAMENTO VALLEY PRUNE NOTES

Written for the California Cultivator
By Sacramento Valley Correspondent

Prune growers in the upper Sacramento Valley territory are quite generally holding for better prices than are being offered, and a good many have pooled their crop with the Cali-

fornia Cured Fruit Exchange. Buyers are offering three and one-half to three and three-quarter cents per pound. Some crops are being offered at \$100 per ton for orchard run.

Prune picking started early this season because of a little weather about September 1 that threatened rain. Some of the first prunes gathered were a little green and have dried out more than those being picked now (September 17). In some orchards it is costing as much to knock the prunes off the trees as the cost of picking up the fruit. In some others pickers are being paid ten cents per box when the pickers knock off the prunes and pick them up and five cents per box when the prunes are knocked off for the pickers.

A good many prune crops are being picked and cured at a cost of \$20 per ton, this covering picking, hauling in, dipping, drying, sweating and sacking.

Two tons of green prunes are making an average of about one ton of cured fruit.

The spider has been a serious pest in prune orchards this season. A thorough winter spraying with an oil spray will be given many orchards in an attempt to kill spider eggs and clean up brown apricot scale which is thick in some places.

There are many trees in Sacramento Valley orchards that are producing 500 or more pounds of dried prunes this season. At four cents per pound this is \$20 per tree. Unfortunately all of the trees in an orchard will not do this, but it gives an idea of the wisdom of selecting buds from superior trees for growing an orchard, and it shows what revenue might be secured from an orchard of trees properly selected and carefully cared for.

YUCAIPA APPLE SHOW

Yucaipa boosters are planning for their "best ever" when the big red apple will be given prominence. The show dates are November 4, 5, 6.

BETTER DISTRIBUTION

With disaster facing the peach grower he is looking in all directions to learn what steps may be taken before another year to give relief. The dried fruit growers are already perfecting an organization to the end that their product may be more intelligently handled. The cannery men are likewise seeking a more certain outlet and are discussing the question "Why compete with ourselves?" Mr. Vernon Campbell, formerly at the head of the Tulare County Fruit Growers' Association, has taken steps to encourage an association of cooperative canneries. We have asked Mr. Campbell for information regarding this organization and he writes:

"No doubt you are well acquainted with the unsatisfactory condition prevailing in the deciduous fruit market at the present time. The peach growers are having the greatest difficulty in the marketing of their crops; in fact, thousands of tons have gone and are going to waste on the ground. Competition between canners has placed the price of the finished product so low that most of the packers are losing money this year. It is esti-

Send for Catalogue

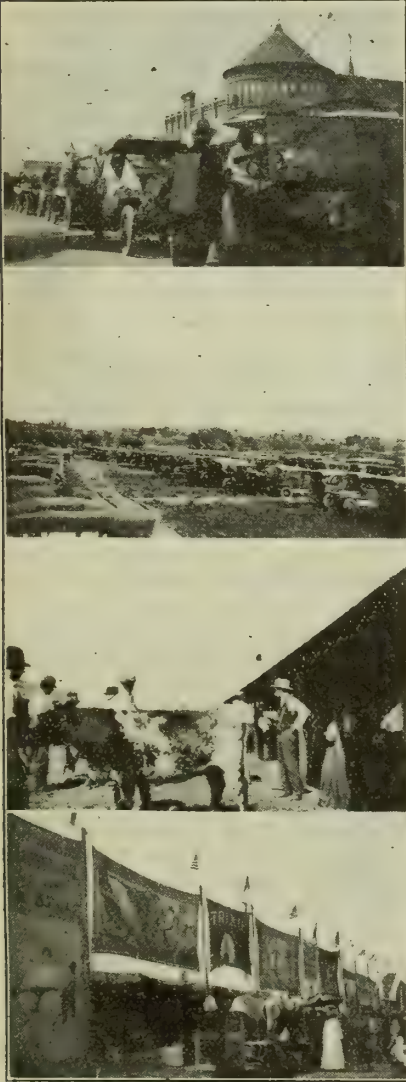

mated that there will be about 50 per cent pack of California canned fruits.

"There seems to be no remedy for the present condition except a better method of distribution. The consumer is now paying about three times what the packer and the jobber receive. It cannot be shown that the various middlemen are making an enormous profit, but the system of distribution is so complicated that the cost of getting the finished product to the consumer puts the price too high for the average pocketbook. As an illustration, the canners today are selling extra standard cling peaches at about \$1.00 per dozen. These goods are selling under jobbers' private brand throughout the country at from 30 to 35 cents, about three and one-half times the amount received by the canner. This difference is noticeable in all California fruit products. The California fruit growers must inaugurate a different system of distribution—some plan that will put fruit to the consumer for less money.

"The California Growers' Association has been formed with that purpose in view. New member associations are being brought in and we expect to be strong enough next year to put our direct sales system in operation. Our plan will put California fruits, both canned and dried, to the consumer in the East at less than one-half of the present retail sales price and will return the grower a good fair price for the fruit and allow the merchant a fair margin of profit."

RIVERSIDE COUNTY FAIR
Editorial Correspondence

Riverside boasts of some of the finest weather made in California. Usually she delivers the goods but there do be some people who have occasionally claimed that there are days when the

RIVERSIDE COUNTY FAIR
Upper, Perris Valley Automobile Contingency Coming Into Town. Acres of Automobiles Parked on Fair Grounds. Judging Shorthorns. Vaudeville Row.

weather gets a bit warm. This is greatly to be desired because the sugar which goes into Riverside's sweetest of oranges is best manufactured under the warm rays of Old Sol so that this summer Riverside orange growers have been a bit disconcerted because of the continual cool season which, while most agreeable to mortals, has not been as strong a factor horticulturally as is often the case, but when it came to Riverside County fair week a better disposition was shown and a thoroughly warm reception was given to all who attended the fair, and there was a bunch of us. A very faint idea of the crowds may be had from the small photograph on this page, made about noon of the second day of the fair in the automobile parking place within the grounds. There were literally acres of automobiles and the view shows only a limited section. The people came from all parts of the county and indeed from some other counties. In proof of this was the attractive booth which came from nearly 700 miles away when little Glenn County in the far north sent down an exhibit of almonds and other of her products. This exhibit held the record for distance covered in coming to the fair. It was well worth it and was in addition a valuable exhibit for the almond—and other—growers of Southern California. The industry in the southern end of the state is not so

far advanced as in the north and Mr. Bane, the almond grower who came with the exhibit, was qualified to answer many questions.

In the same building there were many community exhibits from other sections and be assured these were not all in the big "punkin" class but gave excellent examples of the worth of the products of the various communities. Most of the exhibits were in mammoth tents, though there have been constructed in the grounds purchased a year ago one large exhibit building and a grandstand. A good half mile track is also a feature and the grandstand caught the greater part of the crowd during the afternoon races. The one large permanent building already constructed has been given to household arts display. This is similar to the exhibit place in what was known, in the time of the good old country fair, as "Floral Hall." In this building there were pillows, and bags, crazy quilts and all kinds of needlework, together with cookies, cakes, jams and jellies, pickles and preserves.

The animal industry exhibit was not large. There were, however, some remarkably fine animals shown. There were exhibits of Percherons by Stalder Brothers, R. F. Slaughter, F. L. Hall, A. H. Filton and Fontana Land Company; a good snowing of Shorthorns by F. L. Hall; Holsteins by J. S. Bird

and Company, Stalder Brothers, J. F. Jamner and Son, F. L. Hall; Jerseys by W. H. Rough; Guernseys by C. W. Main and George W. Thomas; Berkshires by F. L. Hall and Thatcher, Ennis and Williamson; Poland Chinas, W. H. Rough, A. N. Knell, Fontana Land Company, Charles R. Hanna, Stalder Brothers; O.I.C. hogs, Southern California Swine Company; Hampshires, J. M. Shrader.

Considering the season of the year the poultry exhibits were fine. The largest representation was by White Leghorns. A surprise to many who were not keeping in close touch with the industry was given in the large number of exhibits of fine Anconas. Perhaps the next most popular classes were the White Wyandottes and Reds. Rocks and others followed closely and made a fine showing.

Another surprise was occasioned by the large exhibit of rabbits. There were Flemish Giants, New Zealanders, Angoras and all kinds of Belgians. Judge Moore, who handled this class and the pigeons, said that both these departments made a remarkably fine showing. In fact, Riverside is noted for bringing out large exhibits of rabbits.

Next to the races, diving girls and other track features, the most popular section was the side show vaudeville attractions. "Side Show Alley" surely did carry one back to barefoot days when the circus came to town.

Some who attended both last year's fair and this one maintained that the number of exhibits was hardly as liberal this year as last, but quality of exhibits and all considered it was a fine county fair. May Riverside give us many more.

Plowing

THE YUBA Ball Tread Tractor is an efficient and economical aid to the farmer, not only in plowing, but in every operation where motive power is needed. **☞ The Yuba gets on the land first.** If the soil is soft, the Ball Tread prevents it from miring. If it is heavy stiff adobe the Yuba is able to handle a sub-soiler working in the hard-pan, plowing deeper and better.

☞ The Yuba works twenty-four hours—no rest—no stop—compact, yet powerful and sturdy, and no skilled mechanic is needed to operate it at its maximum efficiency.

☞ If you are interested in making money—working not only on your own farm, but on your neighbor's—when your plowing, cultivating and harvesting are done, fill in the coupon and send it to

Little Stories of Success

No. 9

Mr. Fred Rollins of Chico, who bought a Caterpillar "60" in March, 1914—and incidentally cleaned up \$1700 the first month he owned it, plowing night and day for his neighbors—dropped in the other day to tell us his story of success.

Much of Mr. Rollins' work with the Caterpillar has been stationary work, and for this he says the Caterpillar has them all beat. In the rice fields, where a separator sinks in mud up to the sills, Mr. Rollins can go with the Caterpillar, and be ready to run right away without stopping to build up any foundation or blocking for the tractor. He threshed a rice crop for one neighbor, where a short time before when this same crop was harvested, the binders had to be pulled through the fields on sleds.

Mr. Rollins is convinced that the right motto in buying a tractor is "Quality First." What's your problem? Write us.

THE FALL VEGETABLE GARDEN IN THE SACRAMENTO VALLEY

Written for California Cultivator
By S. S. Rogers.

IT IS very important in locating the fall vegetable garden that the soil should be of such a character that it will drain readily, especially in sections of the valley in which the rainfall is heavy. The most suitable soil for this purpose is of a lighter, more open character than when growing the late spring and summer crops. Where practical a southern slope should be chosen in order that the soil may be warm as possible.

Fields which are to be planted during the next two months should in many cases be irrigated before planting in order to start the seed and young plants. The ground should be plowed from ten to 14 inches deep in order that it may be well loosened, which will aid greatly in conserving the moisture and preventing packing. After plowing it should be worked into a fine condition of tilth as soon as possible, for if allowed to remain rough the ground will soon dry to such an extent that a good seed bed is impossible. Where the soil is heavy, and especially if the drainage is inadequate, the seed and plants should be sown or transplanted in raised beds. These are made by making ridges through the field from four to eight inches high and from ten to 18 inches in width. The spaces between these beds will aid greatly in carrying away the surplus water, and the soil on these ridges will warm much more quickly and keep from packing much more readily than if the ordinary flat cultivation is used. If the land is level, drainage ditches should connect these furrows in order that the water may be carried off the field. If irrigation is necessary the water may be run in these furrows between the beds, seeping into the ground underneath and allowing the surface to remain dry. It is well to have these beds prepared a week or ten days before planting so that the soil may settle.

Choice of Crops

In choosing crops which are to be planted at this season of the year, only those which are partially resistant to frost should be used. It is well also to consider the demands of the market, the character of the soil, water supply and the capital and labor which is at the disposal of the grower. Many failures are due to planting crops which find no demand in the markets and which require more capital and labor than the grower is able to supply. The extent of the garden is also dependent largely upon these last two factors and too commonly the grower plants more truck than he is able to look after in a thorough manner. As the most advantageous crops to grow are dependent largely upon the local conditions the grower should choose from the following list only those which seem to meet his requirements the best.

Beets

Of the many varieties of garden beets which are offered by seedsmen,

Crimson Globe and Crosby's Egyptian will be found the most satisfactory. The Egyptian Blood Turnip is also a favorite variety, especially for the home garden, although not used as extensively as the former two by the truck gardeners.

Beets may either be planted in drills or broadcasted. Where the raised beds are used the latter method is preferable. The seed should be covered with from one half to one inch of soil. Plants which are planted during October will be ready to use from December until February inclusive.

Cabbage

The best varieties of cabbage for the fall garden in the Sacramento Valley are Early Winningstadt, Early Flat Dutch and Early York.

The plants should be set at a distance of two and one-half feet on ridges which are from two and one-half to three and one-half feet apart. These should be planted as early in October as possible for it is important that the plants become well established before the cold weather sets in. Cabbage which is set during October will be ready to harvest from February to May, inclusive.

Carrots

The principal varieties of carrots are the Danvers Half Long, Improved Long Orange and Early French Forcing; the last being especially popular for the home garden and the former two the common varieties grown for commercial purposes.

Carrots may be grown either in drills or upon raised beds, the latter method being especially popular for the winter garden. The seed should be covered with from one-half to three-quarters of an inch of soil. By sowing during October the carrots should be ready for harvesting from March until June, inclusive.

Cauliflower

The principal varieties of cauliflower for the fall garden are Snowball, Early Paris and Broccoli. The plants should be set in the field immediately, planting them similar to the cabbage. Cauliflower which is set in the field immediately should be ready to harvest during February and March. It is rather late in the season to sow seed for this vegetable.

Celery

Although it is a little late in the season to plant out celery, if it is desired to do this, the Green Top variety should be used. This may be planted either in rows two and one-half to three and one-half feet apart or in sunken beds, putting the plants at a distance of one foot apart. The latter method is especially popular with the Italian truck gardeners. Celery which is planted at this time should be ready to harvest during March and April, at which time there is generally a good demand for this vegetable.

Lettuce

The principal variety of lettuce used throughout the Sacramento Valley is the Los Angeles or New York. The plants may be set immediately in the field, although it is not too late to sow the seed. The lettuce should

always be grown on raised beds, setting the plants from 15 to 18 inches apart and having the tops of the ridges the same width so that two rows may be grown on each bed. If the plants are set in the field immediately they will be ready to harvest from the latter part of November until February. If seed is sown the plants will not be ready to harvest until spring.

Mustard

Mustard for greens may be planted immediately upon raised beds using the Black and Southern Giant Curled varieties, the latter being especially popular. If the seed is sown immediately the crop will be ready to harvest during the early spring.

Onions

The leading varieties of onions for the Sacramento Valley are the California Red, Italian Red, Yellow Globe Danvers and Australian Brown. The former is used chiefly for the early spring crop, but as it is not a good keeper it should be disposed of immediately after harvesting. For storage the Yellow Globe Danvers and Australian Brown varieties will be found very satisfactory. If the plants are to be transplanted the seed should be sown immediately in seed beds so that the plants will be ready to transplant to the field during November and December. If the seed is to be sown directly in the field this may be done during November and December. If the California Red variety is used, the onions should be ready for harvesting during February and March, provided the plants are set in the field during November. The other varieties mature more slowly so that they will be ready for harvesting from March to July, inclusive. When early green onions are desired, sets or matured onions should be planted during October and November. Under ordinary conditions onions will do better under flat cultivation than when raised beds are used.

Peas

The most common varieties of peas are the Stratagem, Telephone, American Wonder and Premium Gem. The Telephone is the most popular variety when producing this crop for the mar-

ket, but for the home garden the American Wonder and Premium Gem will be found equally as desirable. Peas should be planted for the early spring crop during November, generally after the first heavy rainfall. They may either be planted in drills or in hills, and it will be found more satisfactory to use the raised beds, especially where the drainage is rather poor. By planting in November the growers will be able to commence harvesting from the latter part of February.

Radishes

The most popular varieties of radishes are the French Breakfast or White Tip, Scarlet Turnip and Long Red. These may be planted at any time during the fall, and it is a general custom to plant the seed along with such seeds as beets and carrots, for this crop matures so quickly that it is out of the way before the other crops need the land.

Spinach

The most popular varieties of spinach are the New Zealand and Prickly or Fall, the latter being especially adapted to planting this time of the year. This vegetable may be grown either in the raised beds or under flat cultivation and by planting immediately the crop will be ready to harvest from December on.

Turnips

The most popular varieties of turnips are the Purple Top Globe and Purple Top Strap Leaf. Seeds of this vegetable may be planted at any time during the fall in the garden, and are generally grown on raised beds. The crop should be ready to harvest from two to four months after planting.

Aside from the planting calendar, which is given above, the fields which are to be planted during the spring should receive a coating of stable manure varying from ten to 30 tons per acre, and after the first rains this should be plowed under to a depth of at least ten inches. The field may be left in this roughened condition until a short time before planting, or may be worked down immediately. Where the soil is of a heavy nature, the former method will oftentimes prove more satisfactory.

roses, and I had to confess that I was nearly "on the fence" so far as the actual value of budded or own-root roses is concerned but liked to think as well as to know that my garden plants were all as natural as possible and therefore would have upon their own roots all sorts that would do equally as well as if budded on other stock.

But there is another reason that may best be illustrated through use of the graft. All grafted plants, no matter what kind, have a structural weakness in that only the cambium layers unite; the heart wood never does. How then may we have as strong plants as when all substance is one and continuous? This weakness is the cause of many grafted plants breaking off at the point of union. In budding roses a majority of the buds take well, making a union as nearly perfect as is possible, but not all do so, and among a great number some will be found that will always remain weakly and unsatisfactory. After having 135 rose bushes in my garden for ten years and tending them myself I am in a position to speak authoritatively. Some sorts do not unite well with the stock used. Thus in ten Cochets three were never good, three others were fair, and of the remaining four, one was far ahead of the others. Why were not all equally good? Of course individualism enters somewhat for not all would have been of the same vigor had they been own-root roses, but the percentage of good ones would have been greater. Where union is good budded roses are long-lived, but in a large collection a few will drop out every year and at the end of ten years few will prove highly satisfactory. I believe in removal of the weakly ones and replacement just as soon as insufficiency of vigor or deterioration is noted. There is no question in my mind but own-root roses have a much longer life of usefulness than budded roses. On the other hand, there are some fine colors and forms so weakly upon their own roots as to be unworthy of garden space. If we want them they must be budded, but really, we do not have to grow them, for there are enough good sorts suitable for any specific soil so that we need not coddle weaklings. For budded roses it may be said they grow faster and bloom more freely, but for the first few years only.

Dahlia Season

Dahlias are now in bloom everywhere and one may choose and note down what sorts he will grow next year. The flowers range in color from white to nearly black with all intermediates except blues. The size of flower in the dwarf pompoms and singles is often but an inch across, and from this to nearly ten inches in

the larger types is surely a sufficient range to please all. The plants are as low as 18 inches and others run up to six feet. This variety in size, color, etc., makes the dahlia suitable for all parts of the garden wheresoever one chooses to grow them. When used as cut flowers it is best to cut them in the morning while yet it is cool and put the stems in water as quickly as possible. Some growers carry a vessel into the garden and place the flowers in water within the same minute in which they are picked.

Our Best Conifer

After more than a quarter century of study and close observation I am convinced that Cedrus deodara is the most beautiful conifer we grow. For the same length of time I have carefully read every book on any phase of gardening that I could by any means procure. The most satisfying of the latter is Dr. Miller's "What England Can Teach Us About Gardening," costing \$4. But in this book there is an illustration of an Indian cedar carrying an underline which says: "A Deodar, showing the harsh, larch-like texture of young cedars." Yet the subject is to my thinking the handsomest conifer shown in this splendid book. The popularity of this tree in California has grown until now it is planted everywhere. Are we overdoing it? I think not. Plant them freely.

Prize-Winning School Grounds

The awards of the 1915 Beautifying Committee to high schools in Class No. 1, were: Inglewood, first (\$400); Covina, second, (\$200); Venice, third, (\$100); and Montebello, fourth, (\$75). All these were planned by Ernest Branton. A full set of plans and specifications were furnished the first, second and fourth; and the third was advised how best to compete, during a visit to the grounds.

Among the other prize winners Ernest Branton was official adviser to the following: Santa Monica High School; Grant and Garfield Schools, Santa Monica; Central School, Redondo Beach; Central School, Venice; Lawndale; and Zelzah.

Let him plan your parks, school grounds, and residential sites. Country Home Grounds a specialty.

RURAL GARDENING

Written for California Cultivator

By Ernest Branton

It has been said that there is no distinction in California between the styles of gardening in the city and those in vogue in the country, but the statement is not wholly true. Fine country homes have gardeners to care for them, but how about the man who cares for his own little orchard, as well as his home grounds? It cannot be that with acreage to look after he may give the same attention to the flower garden possible to a city wage-earner who is released from his duties at five o'clock each day and who often has Saturday afternoons for pleasure as well.

There are so many similar cases that might be cited in support of our argument for a rural style of gardening that we will assume the governing rules are not the same. Then comes the question: Wherein shall they differ? As a rule bedding and herbaceous plants, known to the trade as "soft stuff", need almost daily attention, but rural gardens should have a minimum of such material and choose that minimum from plants requiring little attention. The California poppy and flowering plants of this class are urged for making bright incidentals in the landscape and also for cutting for house use. For the next step upward what can surpass geraniums for effect under harsh conditions? The ruralite may also have plenty of lawn, for were I in the country I should seriously con-

sider lawn-fed mutton as a meat diet, for sheep are the best lawn mowers and with an automatic sprinkling system we have an economic combination without a peer.

The city man has little space about his cottage for trees, but in the country there is, as a rule, space enough, and in some cases land to the rear or side that is fit for little else than a natural garden of trees and shrubs—ground that is rough, or stony, or having a barranca, canyon, or some kind of a wash running through it. Oh that city tract owners would not so "sleek up" their land that it looks as though it were the bed of the Salton Sea? When finished and ready for the sale of lots there must not appear a depression the size of a dinner plate or a lump or prominence as large as an apple dumpling. But last week a suburbanite said "When can you come out to look at my place and advise me? I have a nasty ravine running through my grounds and I don't know how to get rid of it." Poor mortal, I heartily wish I had one in my own grounds—to make use of. How else may we get a natural water garden, shady banks fern-covered, sunny banks for rock gardens, etc.? Often in the city I have to make these features in order to get a pleasing variety in the grounds, for city gardens are often monotonous—such a sameness everywhere. When we get down to right rural gardening our country will be beautiful.

Why Budded Roses?

A prominent rose grower asked me last week why I did not like budded

CHOICE TWO YEAR OLD ROSE PLANTS

Mr. Mitting, an expert horticulturist, says: "I would rather plant out two plants of roses two years old than twelve small rose plants from two inch pots."

We offer the following roses, all summer bloomers, at special prices: Kaiserin Augusta Victoria, white, 30c; Madame Caroline Testout, pink, 35c; Ulrich Brunner, red, thornless, 50c; Killarney, pink, 35c; Madame Ravary, yellow, 25c; Mrs. Aaron Ward, Indian yellow, copper and gold, new, 50c; Duchess of Albany, red, 35c; Frau Karl Druschki, white, 40c; Perle Von Godesburg, lemon yellow, 30c; La France, 25c; Antoine Revire, pink, tinted with yellow, 40c; La Detroit, pink, shading to soft rose, 40c.

The above twelve beautiful roses, two years old, three feet high, bushy, with heavy roots, sent by express PREPAID, for \$3.00.

Climbing Roses

American Pillow, pink, single flowers, 4 inches across, 30c; American Beauty, pink, 30c; Madame Caroline Testout, pink, 40c; Meteor, red, 25c; My Maryland, glowing pink, 40c; Hiawatha, Hybrid Wichuriana, 35c.

The above six climbing roses, three feet high, heavy bushes, with heavy roots, sent prepaid for only \$1.50.

Berrydale Gardens, Box 685, San Jose, Cal.

Selected Holland Bulbs

Our complete stock, now ready for your inspection, will fill your needs. The beauty and charm of true Dutch Bulbs will add a pleasing touch to the garden or home. Ask us about our \$1.00, \$2.00 and \$3.00 collections of bulbs, also send for our 1915-16 Bulb Catalogue today. It's free.

Beats all how Prince Albert will ring true !

From the start you'll enjoy every puff of a pipe or hand-made cigarette packed with Prince Albert! *Don't* have to be introduced; *don't* have to fire-proof your tongue; *don't* have to do any old thing but lay low on the shade-side of the lane and hum and smoke-smoke-smoke! The patented process makes that possible—and cuts out bite and parch!

It cheers up your smoke-desires most astonishingly—so chummy, so cool, so mild, so mellow, is every fragrant puff of

PRINCE ALBERT

the national joy smoke

You get out your best Sunday jimmy pipe or some makin's papers and let Prince Albert sing its sunny smoke song in the language *your tongue* and *your palate* will know right quick! Give it a real try-out, and there'll be no doubt about P. A. being your side-partner in the immediate future!

Realize, it can't cost you more than 5c or 10c to prove that Prince Albert is all the most ardent enthusiast ever claimed for it!

Prince Albert is sold everywhere in toppy red bags, 5c (handy for rollers); tidy red tins, 10c; pound and half-pound tin humidors—and in clever crystal-glass pound humidors with sponge-moistener tops that keep the tobacco in the finest possible condition.

FARMERS' ROADS

TO BUILD and maintain good roads for the benefit or pleasure of non-resident users is a proposition the farmer doesn't relish. Can he escape this burden and still have good roads?

If the experience of the taxpayers of Illinois is of any value there is a way out of the difficulty. According to statements made by Governor Dunne, in an address before the Chicago Association of Commerce, a road policy has been adopted in Illinois

tax, taking the average, will be only eight cents per acre per year until the bonds mature, which will be at the expiration of about 20 years.

If the estimates of the highway commission are correct in so far as they affect the farmer, a man owning 100 acres of land would pay only eight dollars per year for an improvement worth many times that sum. Instead of being a tax, hard roads of the type Illinois proposes to build will be of direct and immediate pecuniary profit to the farmer taxpayer. They are not an expenditure any more than is the money he puts into seed grain, or a herd of cattle from which he obtains profit. As a matter of fact, the pecuniary return to the farmer through sav-

An Indestructible Concrete Road in New York State. This Type of Highway Means Minimum Maintenance Charges.

which discloses an extremely interesting situation.

It is the purpose of the Illinois Highway Commission to build all leading highways of the most durable materials it is possible to obtain in order that the maintenance factor may be eliminated. To improve the leading roads of the state will require, it is estimated, an expenditure of approximately \$200,000,000. Of the roads not improved by the state none will be more than 4 1/2 miles from one of these state-aid roads. At first glance this would seem to be prohibitive in

ing of time, cost of transportation and the losses incident to bad roads would be more immediate than in the case of a field of grain. Furthermore, the corporations and municipalities of the state will contribute at least 60 per cent of the money invested in the improved system of roads.

Turning to the state of New York, it is said that the farming sections pay only 15 per cent of the cost of the extended system of highway improvement now being made through state aid. A New York farmer, who complained at a public meeting against "being ground to death by highway taxes," admitted that an improved road in his locality had brought him

A Concrete Road in the Illinois River Bottom. Floods Ruined All Previous Roads.

cost, so far as the farmer is concerned. It has developed upon inquiry, however, that the greater part of construction cost, as well as maintenance, will fall upon corporations and municipalities, and that the farmer's share of the

an offer of \$500 more than he had previously considered his property to be worth. He owned a farm assessed at \$3,000. He was very frank to state that the increased value of \$500 was due entirely to this road. The increase in the value of his farm was sufficient to pay his share of the highway ex-

pense for 150 years. The interest on it at six per cent for 12 years would pay his proportion of the 50 years bond period. His individual burden amounted to less than one cent a day and would not go over that figure when the highway system is entirely completed. It is needless to say that the farmer in question was surprised and immediately revised his opinion as to the cost and value of permanent roads.

As stated, the Illinois project has to do with main or leading highways only, but it is interesting nevertheless to compare with this the situation in other states as it applies to road tax in general. For example, in one of the leading agricultural counties of Pennsylvania, the county of Bucks, road tax as levied by the townships runs from four to ten mills on each dollar of assessed valuation, depending upon the extent of highway improvement. A fair average would be six mills. Thus a farmer owning 100 acres of land assessed at \$100 per acre would pay \$60 road tax each year. A great majority of the highways are of the most ordinary type, many of them almost impassable at certain seasons of the year. In contrast to this the Illinois farmer will always be in touch with a fine system of durable highways, for the construction of which his contribution of eight cents per acre will be a mere pittance.

The average cost of concrete roads 16 feet wide, taking the country over, has been \$12,000 per mile. In some states, notably in Maryland, Mississippi and Minnesota, narrow concrete roads have been built for about \$7,000 per mile.

In brief, many of these farms, in so far as easy access to the city is concerned, have become suburban properties. The average maintenance on concrete roads 16 feet wide has been less than \$30 per mile per year, and in the case of a concrete road built in Bellefontaine, Ohio, more than 20 years ago, a road subject to constant use since that time, the average repair charges have been less than \$25 per mile per year. In the state of Connecticut there is a stretch of concrete road four and a half miles long known as the Milford turnpike. After a year of hard usage it was inspected by engineering experts, who stated that throughout its entire length the road was flawless with the exception of a small hair crack in a single slab.

A GOOD BOOSTER

The California Development Board, which is really a state chamber of commerce, extends invitation to all visitors at San Francisco to visit their exhibit which is maintained year in and year out in the Ferry building. In this exhibit there are over 5000 glass stands, containing exhibits of 37 of California's counties. The California Development Board is to the whole state of California what a live chamber of commerce is to a city. Its purpose is to exploit in a conservative, trustworthy way the resources of the state and to cooperate with civic and commercial organizations and county governments for local and state development. It is also a clearing house for their data and activities.

A CALIFORNIA RICE GROWERS' ASSOCIATION

Editorial Correspondence.

A movement has been started for the promotion of a California Rice Growers' Association.

Rice growing is a comparatively new industry in California but it has become one of great importance, and the growers of this crop, in common with all other producers, are confronted with the problem of how best to handle and market the crop.

The markets of this country are not such that an immense crop of any commodity can be sold and absorbed in a short time after harvest except at heavy loss to the producer. There are not physical facilities for handling the crop, and if there were there would be an economic loss if these should be compelled to remain idle for a large part of the year.

Those in close touch with the rice situation contend that the growers must eventually mill and market their crop and must make arrangements that will permit them to hold a part

of the crop from one harvest season to the next. Warehouses must be provided, and there must be some way to help the grower who is short of money and must realize on his crop as soon as it is harvested.

The Cultivator suggests to those among its readers who are interested in the rice business that the success of the proposition depends upon selecting officers and directors who are not only honest and interested in the future of the industry in a broad way but have a knowledge of the successful conduct of big business affairs.

GARAGE BUMPER SAVES FENDERS

Ever notice the bumpers at the end of a railroad siding? They stop the freight cars when the locomotive gets too ambitious.

Such a device in your garage, barn, or automobile shed will save your fenders and lamps, if you fail to stop quickly enough.

Cut two pieces of inch boards about five inches wide and two feet wide and two feet long, and saw the ends on 45 degree angles.

Nail each securely to an upright scantling as supports for a stout board about eight feet long. Fasten the board so that the lower edge is on the floor or slightly higher.

The tires will strike this board, and either the engine will stop or the car start to climb the board, lifting the fenders and lamps clear of the wall.

A still better plan is to attach a regular bumper to the frame of the car. In case of collision, the springs of the bumper frame help absorb the shock, and the bumper protects the front of the car.—Vertical Farming.

BUILDING MATERIAL CHEAP

HOLMES PRICES ALWAYS RIGHT

Many people ask us why it is we are able to quote such wonderfully low prices ALL THE TIME. The first reason is, Efficient Buying; the second, Slight Overhead Expense; the third, Smaller Profits. Exceptional values and prompt service have given us our reputation. Once you deal with us, you will always be a customer.

We advise you to stock up now if you need any kind of building material. Prices were never lower. Note these:

1x4" kiln-dried Good Pine Flooring.....\$18 M	
Fine Interior Finish, Oregon Pine, dry sand- ed slash, only.....\$35 M

You Know What Intensive Farming Means—

It is intensive tire making that enables Firestone to yield "Most Miles per Dollar"

Intensive farming is the increase of crop yields by specialized science—devoting all knowledge and skill to certain crops exclusively.

THIS is the principle on which Firestone tires are made. The increased tire-yield is "Most Miles per Dollar." Firestone tires are made by America's largest organization devoted exclusively to the manufacture of tires, tubes and rims. Specialists at buying—

specialists at building—specialists at distribution—volume of production—give you Firestone quality, the world's standard at low prices.

Send the name of your dealer and the make of your tires and get our **Cementless Tube Patch Free** Also copy of our new book "Mileage Talks," No. 36

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

APPLE DAY

October 19 is National Apple Day. Rosie Apple, together with Miss R. I. Greening and her Maiden's Blush, Rome Beauty, and many other Pippins and Belles and Duchesses with occasional Jonathans, Alexanders and others will be given due honors.

Now all together: "An Apple a Day Keeps the Doctor Away."

BARLEY

California is the greatest barley producing state in the Union, producing more than one-sixth the entire total of the United States. The October first estimate was that our season's output would be 39,400,000 bushels. This is somewhat under the production of last year, which was 42,060,000 bushels.

LEADING TO COLLEGE

An Eastern paper has remarked that while it is possible for the farmer to lead his son to college, he cannot always make him think; the youngsters are sometimes inclined to consider college a playground. One Eastern educational institution which had trouble with too much joy riding has made a formal ruling forbidding any attendant at that college to keep or use an automobile. Many a family has been deprived of comforts for the sake of sending a boy to college, and this abuse of the great privilege given to him will some day be regretted. The best we can do is perhaps to continue to offer the opportunity in the hope that the youngster may awaken to the chance before him.

AVOCADO GROWERS

The California Avacate Growers' Association will discuss matters of interest to all growers of the avocado in the assembly room of the Hotel Alexandria at Los Angeles, October 23. There will be an all day ses-

sion and addresses will be made by some of the best informed specialists in this line in California. A general invitation is extended.

MORE CALIFORNIA CORN

The last government crop report issued states that California's output of corn will be about 2,440,000 bushels. This is against the 2,160,000 bushels produced last year. At a considerably higher price it indicates more prosperity amongst our corn growers. We hope the time is not far distant when another cipher will be added to the string of figures representing our corn output.

DIVERSIFY

The Texas state department of agriculture is appealing to its cotton and other farm specialists to compel continual prosperity by greater diversification. This matter of specializing too often leads to failure rather than success. Even our orchardists who have not only specialized on fruit, but one particular variety of fruit, are now seeing the promise of greater success in the small dairy connected with the orchard. It is possible the youngsters of California might be given some of the pleasure of the boys of long ago when they took out a couple of lusty yearling steers and "broke them in" to

people of Visalia, at which point the convention will be held, joining in making the arrangements, but representative fruit growers from Porterville, Exeter, Dinuba, Lindsay and Ducor, have joined in local organizations for the purpose of completing plans. The committee of farmers consists of W. P. Bartlett, Porterville; C. F. Collins, Visalia; A. C. Merryman, Exeter; Thos. Jacobs, Visalia; W. E. Sprott, Porterville; J. K. Tuttle, Visalia; Frank Daybell, Ducor; C. K. Towt, Lindsay; C. B. Earhart, Dinuba, and E. Barris, Dinuba. Miss Lillian D. Clark of the University of California will conduct women's sessions in connection with the convention. The date of the convention is November 18-20. Also, preceding the convention there will be held sessions of the state association of the county horticultural commissioners. One of the principal features of the convention will be the consideration of marketing; to this question an entire day will be devoted.

LARGE PRICES

The account of the Sacramento sale of Holstein-Friesian cattle in this issue of the Cultivator will be an eye-opener to the typical old-time farmer. He will naturally ask, "Why should a stock breeder pay \$2500 for a six-months-old bull or \$1500 or \$1600 for

YOU ARE REALLY MEMBERS OF OUR FIRM.

And we want you interested in every department of this paper.

If you have any question to ask the editor or any criticism of any kind, don't hesitate to write.

We want your subscription and we want you to try and interest your friends and neighbors so that they will help us too. The more regular readers we have, the easier it is for us to get advertising, and no farm paper can live without a good volume of advertising.

When you buy merchandise of any kind we ask that you try to patronize the business men who give us their advertising. They are all first class, reliable and square dealing in every respect. The more trade they get from readers of the California Cultivator, the more they will pay us for advertising, and every dollar we get from this source is one dollar more to spend for better editorials, better pictures, better type, better printing and a better paper in every respect.

Don't fail to tell the advertiser you are a reader of the California Cultivator. This may seem unnecessary to you, but, oh! how it helps us.

do some of the farm work. The exercise given to the youngsters was excellent for their bringing-up and did not in any way lower the quality of the beef.

ERADICATION

It is often claimed that insects or pests once fully established are never eradicated. As a bit of encouragement we would like to call attention to the fact that the federal department of agriculture has taken hold of the Texas fever tick and now millions of acres which were formerly under quarantine in this state and many Southern states have been released because most careful inspection failed to discover any infestation whatever. The foot and mouth disease may also be referred to. We would not say that this is entirely eradicated. We believe it will be so far as this country is concerned, though it is possible it may at any time be reintroduced. Let us all observe the greatest care and extend every aid to those whose duty it is to quarantine or give treatment for these pests.

FRUIT GROWERS' CONVENTION

Dr. Cook writes that arrangements for the coming forty-seventh state fruit growers' convention are progressing and that not only are the

a very ordinary looking cow?" And well may he ask it, for these are large sums of money. But we note that the class of people paying these large sums are not sporting people; as a rule they are hard-headed business men and are making an investment which they expect will return big interest. Not one of these purchasers is maintaining "a boarder" in his herd, but they are demanding of every individual in their herds far more than their upkeep, and the only way to secure these wealth producing animals is to secure the blood which flows in the veins of large producers.

As an example of the wisdom of paying a long price for a single animal, we may give the instance of one of the older bulls sold at this sale, which was purchased some years ago for \$1500. At that time he was young and untried. The farm had his services for many years; he added many valuable animals, some of which sold for long prices, and was profitable in every way. At the time of this sale he commanded \$500 more than he brought as a youngster. An indifferent or unprofitable animal would have been a drag during all these years and in addition would have brought nothing from intelligent buyers. Our dairymen must understand the value of good blood.

Agricultural Notes

The Egyptian cotton crop is proving satisfactory.

There is a shortage in the honey crop of England this season.

The hop crop of Bohemia now shows a 50 per cent decrease over last year's.

One thousand counties in 48 states of the Union now have farm advisers.

No molasses can be exported from the Netherlands according to government decree.

The National Poultry, Butter and Egg Association convened in New York, October 4 and 8.

Austria has fixed the maximum price for raw sugar from the coming harvest at 2.85 cents per pound.

Citrus growers of Cuba have had a poor season, prices being very low. Last season their crop was large and prices excellent.

The Satsuma orange is having a boom among growers of Alabama and Mississippi, and large districts have been planted to this fruit.

The United States geological survey has informed the bureau of foreign and domestic commerce that the manufacture of porcelain doll heads has been established in Philadelphia.

Farmers' meetings in the Bermudas are giving special attention to quality of seed potatoes. They have been investigating methods followed by successful growers in Maine and Long Island.

The number of ocean-going vessels passing through the Panama Canal during July was 170, about 65 per cent greater than the average for the preceding months. The tolls collected amounted to \$573,366.

Walnuts from France will be ready to go forward to the United States early in October, as the season is in advance this year by at least 15 days. The voyage to New York via Marseille takes about 17 days.

The Mexican state of Guanajuato has a new trade body in the recently organized national chamber of commerce of Leon. The new chamber plans to have correspondents in every important district in the state.

Florida's orange crop is showing up about ten per cent short of last season's and from ten days to two weeks later in maturity. Unusual activity is manifested in building and overhauling packing houses to make ready for the shipping season.

A partitioned barrel has been patented by a British Columbia fruit man. An ordinary barrel is divided into two equal parts by two partitions so adjusted as to permit the barrel being sawed in two in case a purchaser wishes only half a barrel of apples.

Florida citrus growers are seriously alarmed over the citrus canker situation. Dade county growers are asking that the federal government furnish the money and take charge of the fight against citrus canker in the citrus fruit growing states. It is suggested that \$2,000,000 will be required to insure the eradication of the canker disease. The growers contend that the agricultural department of the federal government took up the fight against the foot and mouth disease in cattle, which broke out in the North last summer and they say that there is just as much reason why it should take up the fight against citrus canker. The state has already expended \$125,000 in the fight.

Agricultural News Notes

of the Pacific Coast

Northern California

A fruit festival will be held at Paradise, Butte County, on Saturday, October 16.

One thousand acres will be planted to rice next season by Eugene Rutherford of Gridley, Butte County.

Home economics demonstrations will be given in Placer County this month by Miss Clark of the state university.

The first special train to carry onions exclusively from Sacramento to the East left Sacramento on October 1. The train was made up of 20 carloads.

Butte County rice growers are searching for an early maturing variety of rice that will escape the fall rains and at the same time yield heavily.

Seven steam tractors are plowing on the great Moreing Ranch in the Natomas district. Practically all of the 25,000 acres in the ranch will be sown to grain.

The Solano County board of supervisors has passed an ordinance regulating the vaccination of hogs against cholera and providing for a quarantine of diseased animals.

Improvements are being made on the roads between Gridley and rice growing sections of Colusa County preparatory to the rice hauling season which will start within a few weeks.

A band of 300 mules, purchased at Lakeview, Oregon, was driven to Red Bluff, Shasta County, for shipment to San Francisco. They were ten days making the journey from Lakeview. They are on their way to Europe.

The California Almond Growers' Exchange has fixed prices as follows: Nonpareil, 14½c; IXL, 13c; Ne Plus, 12c; Drakes, 10½c. Since these varieties represent the major portion of the crop other varieties produced in limited quantities will be sold according to relative values.

At the recent annual meeting of the California Almond Growers' Exchange George W. Pierce of Davis was elected president, A. S. Lasell of Lodi, vice president, and J. B. Wrangham of Antioch, secretary. The exchange during the year lost three members and gained 281. The total membership is now 908.

The high school agricultural clubs of Glenn County are this year engaged in a corn contest. Crops raised by the clubs are about ready for harvest. An incident in the contest includes a display of products selected by the boys as being, in their judgment, most perfect. At both Willows and Orland displays have been made in store windows.

Modoc, Siskiyou, Lassen, Shasta and Trinity Counties have perfected an organization known as the Northern California Counties' Association. The headquarters of the association will be at Redding, Shasta County. D. V. Saeltzer of Redding has been elected president and R. J. Anderson, secretary. Each of the five counties will be represented by a vice-president.

Central California

Fresno Day at the district fair was celebrated by over 15,000 people.

The California Fruit Growers' Convention will assemble in Visalia, November 18-20.

Many Dinuba growers are subscribers in the new Peach Growers' Company.

Many farmers in the Oakdale district of Stanislaus County are planning to put in rice next year.

Orchardists of Hollister, San Benito County, are making large purchases of fruit trees for winter planting.

Cantaloupe shipments from Turlock this season have totaled about 1400 cars, against 519 cars in 1914.

Porterville will hold a chrysanthemum show Wednesday and Thursday, November 10-11, at the pavilion.

The prune crop of Tulare County is practically all gathered. Prices received range from \$22.50 to \$29.00.

The federal government has two experts in Watsonville investigating causes of browning of apples in cold storage.

The California Associated Raisin Company has issued its new schedule of prices becoming effective on September 28.

The Porterville chamber of commerce is laying plans for the chrysanthemum show which will be held November 10-11.

The executive committee of the newly organized California Peach Growers' Company reports subscriptions already received totaling \$100,000.

Beginning September 30 and lasting until December 3 there will be a succession of live stock shows on the grounds of the exposition at San Francisco.

Light fines imposed for raisin stealing are resented by the California Associated Raisin Company's management, which considers jail sentences called for.

Members of the Tulare County Protective Association met at Lindsay last Saturday afternoon to discuss the activities of the association for the coming season.

The week beginning Monday, October 4, was prune week at the Panama-Pacific, and Santa Clara County passed out many packages of fruit to visitors at the California Building.

The Kern County Farm Bureau at its annual meeting on September 1 elected president, F. H. Hall, Bakersfield; vice president, C. H. Stiles, McFarland; secretary-treasurer, K. S. Knowlton, Bakersfield.

The Dickinson Ranch in Stanislaus County has been purchased by Robinson Brothers, cattlemen of Merced. This ranch will be combined with other property belonging to the buyers into a big Hereford pasture.

The Turlock melon season has practically come to a close. This season's shipments total about 1400 carloads. The prediction is made that between 3000 and 4000 acres will be planted to cantaloupes in this section next year.

Southern California

A new cotton compress has just been installed at Imperial.

The orange marmalade factory at Monrovia is almost completed.

Many sales of lima beans have been reported at Oxnard at \$4.12½ cents.

Fillmore, Ventura County, has the promise of a citrus by-products factory.

The Beaumont Fruit Growers' Association will double the size of its present packing house.

The lima bean growers of the Goleta district of Ventura County have formed an association.

The San Gabriel Valley Potato Growers' Association has shipped this year 500 carloads of its summer crop.

Members of the Santa Ana Valley Walnut Growers' Association report crops from a half more than to double last year's.

The Hemet-San Jacinto Valley Growers' Association has been formally incorporated, and it is thought a cooperative cannery is assured.

The Escondido Tomato Growers' Association has made several carload shipments of tomatoes to Denver. The cars are iced in San Bernardino.

Yucaipa Valley will hold its annual apple show November 4-6. Work on the roads into the valley it is expected will be finished before the opening date.

At the recent annual meeting of the Hemet Orange Growers' Association Manager Hamilton reported that the association had packed and shipped 24,852 boxes of oranges.

Residents of the Fairview farm district, southwest of Santa Ana in Orange County, held a booster products fair last Saturday. Cash prizes were given for best exhibits of farm products.

Work has begun on the 5000-foot levee which is to be built at a cost of \$8000 for the Talbert drainage district by the Newbert protection district in a line extending in a northerly direction along the coast from the west bank of the Santa Ana River.

A new lemon and orange peel cleaning machine has been installed at the Kingsbury by-products plant at Redlands. The machine cuts the fruit in half and scours out the juice and pulp, leaving the peel clean, to be packed in barrels, covered with brine and shipped to Chicago, where it is made into candied peel.

Several carloads of walnuts have been shipped from the association packing house in Santa Ana. They were of high quality but not quite up to the high standard of last year's crop. Sunburn during the last hot week of August did more damage than was thought at the time. There will be considerable reduction in the output of merchantable nuts on account of the rigid culling which growers and packers are obliged to practice. The association will take care of the culls of its members by shipping them to the walnut cracker in Los Angeles.

The Coast

The University of Arizona has a splendid new agricultural building.

Farmers' short courses will be given at the University of Arizona college of agriculture January 3-15.

Two thousand head of feeders have been secured in Minnesota to be fattened at Chandler, Arizona.

Large sales of Yavapai, Arizona, range cattle are now being made. The average price is six cents on foot.

The Northwest Shippers' Council, in connection with the growers, is working on a plan to stimulate demand for apples.

The forestry office at Provo, Utah, reports that recent rains in the mountain ranges have brought up good cattle and sheep pasture.

Montana held its 13th annual state fair at Helena September 20-25. An exceptionally large number of entries were made in the agricultural division.

The International Dry Farming Congress, held in Denver, closed on October 4, and the exposition held in connection with it will close on the 10th.

Hop growers near North Yakima, Washington, find this year's tonnage 4000 bales under early estimates. The total yield will not exceed 26,000 bales.

The Northwest Shippers' Council and the North Pacific Fruit Distributors have adjusted their differences and are planning to cooperate in constructive work.

On the 15th of this month the Southern Pacific puts into effect its new freight tariff between interior points in Oregon. The rates will be slightly higher than heretofore.

Estimates of this year's acreage of hops in the four principal hop growing states, California, Oregon, Washington and New York, show a slight net increase of seven-tenths per cent.

The Arizona Poultry Association held its regular monthly meeting at Phoenix October 9. At this meeting a plan was discussed for producing guaranteed eggs backed by the association.

Cattlemen in the vicinity of Roswell, New Mexico, met in that city on October 6 to work out plans for closer cooperation. They also decided to ask the federal government to lease more grazing land.

An egg rancher in the Chandler district of Arizona has developed a good market for eggs in the mining districts. He is now shipping daily to the mining camps eggs secured from nearby ranchers.

Five hundred acres of peat land were burned over near Valley, Washington, the last of September. Sufficient warning was given so that many stacks of hay and grain were removed from the path of the flames.

A meeting of the live stock board of the Western states was held in Kansas City, October 4, to consider the establishing of uniform quarantine measures against all Eastern states affected with the foot and mouth disease.

You'd think it ridiculous to deliberately throw away a good set of harness. Yet when you fail to keep your harness oiled you actually throw away years of its usefulness.

EUREKA HARNESS OIL

Leather is very porous. And unless you keep your harness oiled, sweat, moisture, dust and heat rot the fibre and thus shorten its term of service. Eureka Harness Oil preserves the original life, strength and elasticity of tugs, straps, and breechings—adds years to their life. Get your harness dealer to dip your harness occasionally or apply it yourself by hand. Dealers everywhere.

THE FOOT AND MOUTH DISEASE SITUATION

Written for California Cultivator

R EPORTS from the Middle West indicate that unless there is some new development the last outbreak of foot and mouth disease will soon be cleaned up. The last of the herds in the infected districts are being condemned, killed and burned, and it is to be hoped that the authorities have taken precautions that will prevent further spread of the disease. It seems to be agreed that the last outbreak came from the use of hog cholera serum, infected with foot and mouth disease germs, made at the Chicago stock yards after there was foot and mouth disease there, and the government authorities are being severely criticized for not having destroyed this serum.

In the handling of this and former foot and mouth disease outbreaks in this country the policy of the authorities has been to slaughter and destroy all of the animals in infected herds. Most of the animals so destroyed have been grades and scrubs, and for these there is provision in most states for appraisal and payment by the state and federal government on the basis of a fair market value.

But in the case of registered pure bred animals a stand has been taken by some states and by federal authorities that makes an outbreak in such a herd a severe tax on the unfortunate owner. For the animals appraised a maximum value of only \$300 per head is allowed. This is all right for a great many animals, but decidedly unfair when applied to superior individuals worth from \$300 to \$10,000, as many are now valued. In one state, New York, the owner has recourse to the courts where he may prove his actual damage and recover it.

The fact that many of the best dairy animals in the country were at the National Dairy Show in Chicago at the time of the outbreak and were quarantined and held for several months, many having the disease before they were allowed to be taken home and placed in further quarantine, has led to considerable discussion as to the wisdom of slaughtering all of the animals in infected pure bred herds. Some claim that germs remain concealed about the animal and at some later time reinfect it, causing another outbreak. This is the theory reported to be held by some European students of the situation. A close study has been made of the animals infected at the Dairy Show, and from these careful observations much valuable information on the subject will be recorded.

The California authorities have taken the stand that there is justification in a quarantine so rigid that there will be absolutely no danger of introducing the disease among our herds and flocks. Once established in our foothills and mountain ranges it would probably never be eradicated.

Just now pressure is being brought to bear in the interest of Eastern breeders who want to show cattle, sheep and hogs at the Panama-Pacific International Exposition. The claim is made that it is unfair to shut out herds from districts that have never been infected, as barring everything from east of the Missouri River would do.

There may be some adjustment of the differences between the California authorities and those desiring to make a show, that will be satisfactory to our friends and guests, the Eastern breeders, and will safeguard our live stock industry.

WESTERN NATIONAL DAIRY SHOW POSTPONED

At a meeting of the directors, held on September 6, it was determined to postpone the Western National Dairy Show for one year owing to the facts

that there is a great deal of uncertainty as to the danger from the spread of the foot and mouth disease, the general depressed condition of the industry and the fact that the machinery and dairy manufacturers have centered their entire 1915 appropriation at the San Francisco exposition.

The directors feel certain that the importance of the Western National Dairy Show will be brought home to every man engaged directly or indirectly in the industry, and the plans for a big 1916 show will go on. In the meantime it is up to you as an individual to take this matter up with people who ought to be interested and see that they cooperate, which they no doubt will, if the matter is called to their attention in the right way. The Western National Dairy Show will be incorporated, and plans will be continued for a larger show in 1916 than was contemplated this year.

MORRIS-McALISTER SALE

Continued from Page 363

bought a large number of the best and secured exceptionally good values.

Jas. McGillivray of Sacramento bought heavily of the best ones at good prices, as did Dr. D. M. Faris, Sacramento; W. F. Mitchell, Visalia; T. J. Gilkerson, Visalia, and Thos. J. Cox, of Sacramento.

The Bridgeford Company, breeders of gaited saddle horses and Holsteins at Knightson, bought several.

Among other Sacramento Valley buyers were J. H. Guili, Jr., Chico; W. T. McBride, Los Molinos; S. A. Mealy, Gridley; the McCloud River Lumber Company, J. H. Harlan Company, Woodland; I. G. Zumwalt, Colusa, and J. P. March, Woodland.

F. M. Helm, a prominent dairyman at Fresno, bought several, as did Frankenheimer Brothers, Frank Stark and Geo. F. Starin of Stockton and Ed Tomasi and W. F. Martinelli of Petaluma.

Other buyers were R. F. Fisher of Carlotta; J. H. Williams, Palo Alto; H. Hewins, Calistoga; W. F. Mitchell, Visalia; A. S. Knight, Vallejo; C. A. Miller, Ripon; F. E. Heath, Pleasanton; L. Mimi, Vallejo; Geo. Orr, Galt; Geo. Winters, Ione; Chas. Colquhoun, Mills; F. H. Bennett, Verona; D. W. Norman, Wheatland; E. F. Peterson, Hayward; S. G. Gambonino, Petaluma, Wm. Bishop of Chimaicum, Washington, bought some good ones; as did R. F. French for the Kamehameha Schools, Honolulu.

There were a number of buyers, like F. J. Kiesel, for instance, who are men of means and who fully realize the importance of good stock in California. There is a particularly bright future for breeders of this type because they have the business ability and money to make their undertakings a big success.

There was a big crowd in attendance, among them R. M. Hotaling and P. H. Davis, of San Anselmo; Gordon Hall, San Francisco; Manager Canon of Millbrae Dairy, San Francisco; W. H. Saylor, San Francisco; Geo. Smith, Corcoran, Mrs. C. J. Welch, Los Banos, and many others prominent in the dairy world.

The state fair officials provided every convenience for the sale and invite events of this kind for future dates. The cattle were housed in the cattle sheds and sold in the county exhibits building. Secretary Paine understands the importance of such sales and wants to see more of them.

It was a splendid setting for the sale and the weather was perfect.

The benefits conferred upon the dairy industry of California by some of the earlier breeders who had high ideals and discarded inferior individuals regardless of their breeding, men like R. M. Hotaling and P. H. Davis of San Anselmo, and Pierce of Stockton, is apparent in the many splendid animals of their breeding in present day herds in California.

Purebred Registered HOLSTEIN CATTLE

With thirty common cows, each giving 3000 pounds of milk per year, introduce a purebred registered Holstein bull. In two years you will be milking grade Holsteins yielding with first calf 4,000 to 5,000 pounds. In 3 years, you'll have 6,000 pound cows and will need to keep only fifteen cows to get the same amount of milk. In seven years, you'll have 8,000 to 10,000 pound cows and a ten-cow herd will produce as much milk as your thirty cows do now. Quite a saving in labor, feed and equipment to say nothing of the increased value of your cows and calves. Investigate the big "Black-and-Whites."

When writing advertisers, mention the Cultivator.

cial bodies and the general public recognize great events like this sale was clearly brought out in a speech to the breeders at the close of the sale by a representative of the Sacramento chamber of commerce, who stated that this body did not know what the sale meant until it was nearly over, although it had been widely advertised, but that at another sale of this sort the breeders in attendance would be royally welcomed and entertained.

Another Cultivator representative, Mr. C. A. Briggs, adds the following:

Notes
Seventy-five thousand eight hundred and twenty-five dollars is the record total realized from the sale of 166 head of Holstein cattle, ranging from a few months old to mature age, at the Morris-McAlister sale on the state fair grounds at Sacramento on October 6 and 7. The average price also broke all sales records on the Pacific Coast, being \$459 per head for all ages. Three leading cows sold for \$4200, an average of \$1400, a Morris cow leading at \$1550. Five bulls went for \$8150, averaging \$1630. A 6-months-old bull topped the sale for \$2500.

Geo. A. Smith of Corcoran attended the Morris-McAlister first annual Holstein cattle sale at Sacramento on October 6 and 7.

T. L. Gilkerson, breeder of Holstein cattle, was in Sacramento on the 6th and 7th to attend the Morris-McAlister sale.

The Kamehameha Schools of Honolulu, represented by the head of their live stock department, J. D. French, purchased four cows and one bull at the Morris-McAlister sale. Mr. French will also ship to the islands a fine Berkshire boar.

Wm. Bishop of Chimacum, Washington, was one of the out-of-the-state buyers. He runs a large herd and has a creamery and cheese factory on his place.

Buyers for the Anita Baldwin ranch took south with them a full carload of 30 head.

Two thousand dollars was paid by H. E. Cornwell of Modesto for the former senior herd sire of the Morris herd, King Segis Pontiac Emperor.

Lorena Korndyke, a Morris bull of perfect type that has taken first prize at the California state fair for four consecutive years, was sold to McCloud River Lumber Company.

High prices at the sale are as follows: Bulls, \$2500, \$2000, \$1500, \$1150, \$1000; cows, \$1550, \$1500, \$1150.

Two of McAlister & Son's cows went over the thousand dollar mark; Winnie Korndyke Cornucopia De Kol, \$1500 and Uneeda Korndyke Abbie, \$1150, both being sold to T. S. Gibson of Williams.

Following is the list of purchasers with animals bought at this sale:

A. S. Knight. Segis Pontiac Modesto De Kol.

F. W. Kiesel. Molly Korndyke Hengerveld II, Genesto Netherland Walker, Jane Korndyke of Riverside, Helen Nye Skylark, Segis Tarde Maid, Sita De Kol Princess, Salo Pontiac Burke.

F. E. Heath. Newton Juliana, Mona Topsy Pontiac, Topsy Pontiac Homestead, De Kol Fidonna Homestead, Newton Juliana Starlight, King Korndyke Pontiac, Fidonna De Kol, Parthenia Korndyke De Kol II.

Danger for the Great Milker

Queen Schillaard,
No. 83154,
Owned by Dr. Roberts
Year's Butter Record
680 Pounds.

Freshening time is the most critical period in the life of a cow or heifer. No injury or sickness has such disastrous results as failure to properly clean. If blood poisoning does not set in (sometimes causing death), the animal will be ruined as a milk producer for the whole season. Many cows, especially heifers, retain the afterbirth. If allowed to remain, disease and blood poisoning may follow. If you forcibly remove it, some parts of the afterbirth will remain. These parts decompose and are absorbed by the animal, causing a rapid wasting of flesh and loss of milk. Avoid all danger by using

Dr. David Roberts' COW CLEANER AND ANTISEPTO

Cow Cleaner stimulates the circulation in the blood vessels of the genital organs, causing the afterbirth to ripen and come away of its own weight, leaving the organs in a healthy condition. Cleanse the genital organs with Antisepto—it is cooling, soothing and healing, all of which are essential to health. Keep your cows in a healthy breeding condition. Give them the help they need at this trying time.

Cow Tonic Aids digestion, increases appetite, tones and keeps animals in condition.

Breeding Tonic Acts on the genital organs and puts in condition for breeding.

Calf Cholera Remedy Prevents scours and calf cholera. Avoids stunting. Keeps calves growing.

Ask at your drug store also for Dr. Roberts' Calf Meal, Diolice, Badger Balm, Laxotonic and Stokvigor.

There is a Roberts' medicine for every common animal ailment. Over 500,000 copies of the great book (184 pages), "Practical Home Veterinarian," are already in the hands of live stock owners. If you do not have a copy, send 25 cents and copy will be sent postpaid, together with 8-ounce sample of Stokvigor.

Go to your druggist. Buy Dr. Roberts' animal medicines and tonics. Over 3500 drug stores carry them. Take no other. If your druggist hasn't Roberts' goods, write us direct. Give us his name. We will see you are promptly supplied. Look for and insist on getting the package that bears Dr. Roberts' picture.

Special Sample Offer—Stokvigor, 10c

This trial package of Stokvigor will care for one cow or horse two weeks. Get it and see for yourself what a nice stock tonic or stock food you can make. Enclose dime or stamps.

BERKSHIRE PROGRESS

Great progress is being made in the pure bred hog business in California. There are a great many high class herds in the state and to these are constantly being added individuals of outstanding merit.

Butte City Ranch at Butte City in Glenn County recently purchased Schoolmaster Premier 209275 in the sale of W. S. Corsa of Whitehall, Illinois. This is one of the best herds in America.

Schoolmaster Premier is by Schoolmaster 2d, one of the best sons of the famous Masterpiece, and is described as having an extra good head, a deep, long body, good hams, feet and legs, and being very smooth. He combines the blood of the Masterpiece and Lord Premier's Rival families on a Royal Empress foundation. He will be one of five or six herd boars that will be used in this herd this season.

A GREAT HONOR FOR PROFESSOR HERMS

There is a relish for compliments by all mankind, but who would like to have a well-built, stalwart and efficient, even though vivacious, louse named after them?

Those who long for honors should have heart, for who knows but what some great-hearted scientist may sometime name a louse after them, and thus carry their fame through the ages.

Such honor has come to Prof. William Brodbeck Herms, member of the Berkeley board of education and associate professor of parasitology at the University of California.

Prof. Herms didn't particularly need the honor. In fact, he has several other bugs named after him, though perhaps none quite so sprightly of manner and temper. But he is pleased, nevertheless, for scientists are more charitable toward insects than plain people.—L A Times.

CALIFORNIA HOG BOOK

"The California Hog Book," a compilation of information about hogs, applied to California conditions, by W. S. Guilford, director of agriculture for the Sacramento Valley Irrigation Company, published by the Pacific

Rural Press at \$2.00, supplied with a year's subscription to California Cultivator, \$2.75 postpaid.

Years of close observation and experience have fitted Mr. Guilford to write a book on hogs. He has done his work well, and the 252 pages of this book are filled with information which the practical hog man of California will appreciate. That there is occasion for hog men of California to read such a book is shown by the first and third paragraphs of Chapter I.

"There were 877,000 hogs in California in 1915—and about 3,000,000 people—less than a hog per capita. In the entire United States there are now about 4,000,000 hogs—and about 100,000,000 people—more than half a hog per capita.

"There are no figures to show what the annual per capita consumption for California is, but we import over 2,000 carloads of hams, bacon and other pork products from the east, and nearly 1,500 cars of live hogs from Utah, Idaho and other states every year."

We have always urged greater production of pork in California. As Mr. Guilford says:

"The shortage has been caused not by difficulties, but by lack of producers. Hundreds and thousands of hogs are raised on the big grain and stock ranches in the state—and an increasing number on the smaller, more intensively cultivated, diversified, irrigated farms. It is from an increase in the number of successful owners and operators of the type of farm last mentioned that we must look for the production of more and better hogs annually, and everything that is done to encourage the establishment of such places on a sound basis is worthy the attention of the most progressive business men and financiers in the state—to foster such development is to be a factor in the best sort of empire building."

There are 22 chapters in the book, touching upon the industry in general, California conditions, description of hogs, judging and selecting, care, feeds and feeding conditions, buildings and appliances, health and diseases, markets and marketing, and many other most helpful topics.

PRIZE BOY FARMERS TO HOLD CONVENTION

The greatest convention of boys' agricultural clubs ever held in any state is to take place at the university farm at Davis from Thursday afternoon, October 14, to Saturday morning, October 16, to celebrate their achievements in the yearly crop-growing contests which are doing wonders in showing what good farming really means.

There will be 250 boys there to represent 55 out of the 65 boys' clubs organized by the University of California. Nowhere are greater contributions to the prosperity of the community being made by the boys' clubs than in California, for the prize winners and their close competitors are giving to their neighborhoods examples of how to improve the yield and the profit of California farms which often make their elders' eyes stick out of their heads with surprise and admiration.

Florida's orange shipping season began October 1.

Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Eczema

I recently bought a five-year-old mare and she has Texas itch or something of the kind. We have applied sheep dip No. 1 according to directions once a week for five weeks, then used it about four times as strong several times. Still it is not cured. Is there a remedy for it?—Subscriber, Phoenix.

It may be due to something that is more than skin deep. Try Fowler's solution of arsenic; a tablespoon once a day for a month.

Scours in a Goat

I have a fine goat that has the scours and I have tried all the remedies I know of without benefit. Can you send me a remedy?—Subscriber, Santa Cruz.

Give ten grains of tannoform (Merck) morning and evening for a week. If your druggist does not have it then give the following powders: tannic acid one dram, powdered gentian one ounce and soda bicarbonate one ounce. Mix and divide into 10 powders and give one powder morning and evening.

Lung Worms

I have lost several calves about six months old. Finally killed one that was about gone and found its lungs full of white, wire-like worms from one to one and one-half inches long. I now have two more that I fear may have them. What can be done for them and how can I get rid of them? Do they stay in the soil? Please tell me all about them.—Subscriber, Lator.

The history of the lung worm is not well known, but it is supposed to be in damp places in the pasture and to be taken in with the food. We often hear of it affecting young cattle in the summer and fall. The best remedy known is turpentine. Drench the calf with one ounce of turpentine in a cup of milk. For full grown animals double the dose. Repeat this treatment every day or two until cured. A better and quicker way to reach the worms is to use a hypodermic syringe and inject one-fourth the dose of turpentine clear, directly into the windpipe. The needle of the syringe should be passed through the skin about half way down the neck and between the rings of the windpipe. After injecting the medicine hold the calf's head up for a moment until the medicine runs down into the lungs. Two or three treatments of this kind a day or two apart will usually cure.

Sheath Stopped in Hog

Lost a 50-pound male hog a few days ago. Noticed some time ago that his navel or sheath was swollen slightly. One night he did not eat and next morning walked as if weak in back. Lived three days; back weaker each day although he ate and passed from bowels seemed natural. Have fed dry alfalfa hay and separated milk. Gave him physic and he died almost immediately. Opened him and his organs appeared natural except the bladder, which was much enlarged and perfectly black. Can you tell what was the trouble and what to do in case others are affected?—Subscriber, Bravo.

There seems to be a large percentage of lime in the urine of hogs in the Western country and sometimes the lime accumulates in the sheaths of hogs and if not washed out will cause enough irritation to close the passage and the dammed up urine will cause inflammation of the bladder. When you see the sheath swollen wash it out with plenty of warm water with a little soap in it and squeeze out the accumulations that may be there. It is not a disease, only a foul condition.

Poultry for Profit

POULTRY TROUBLES DURING THE FALL SEASON

THE success of the flock during the winter season depends greatly upon how the birds pass through the fall season, which usually finds the flock composed of birds of all ages and all conditions and stages of moult.

The roosting quarters are found scattered all over the place, some roosting on fences, some in the poultry house, some in trees, and some in hovers or jammed into the corner of a house till they are two or three deep during cool nights. The ones roosting in houses and on the floor in the corner of some house are the ones which need attention.

One of the most common troubles noticed in the fall and early winter is colds and roup. A cold is usually the first stage or stepping stone to roup so that if colds are prevented, roup will be avoided. The two common causes for colds are an unequal heating of the body and the rapid reduction of the temperature. Roosting in a draft will cause a cold according to the first stage, and crowding will cause it by the second.

If a man's temperature gets too high from exercise or extra clothing, nature sends out a perspiration or sweat onto the surface and by evaporation the heat units are taken up and the body is cooled. A hen's temperature is not reduced in this way, for she has no sweat glands in the skin. The moisture with the hen is carried out through the breath, so for this reason if a hen is very warm she will have her mouth open bellowsing the air in and out to take out the moisture and not to get an extra supply of oxygen into her lungs. If the chickens are crowded at night till they are very warm, then come out into a cold, frosty morning, the breathing organs are so chilled that a cold is the result, which paves the way for roup.

Many cases of roup attributed to the winter season had their real origin in the fall season. A hen's temperature is 106½ degrees. She is covered with a coat of feathers for protection. Therefore hens should not be expected to live under conditions which are comfortable for man. More birds are injured by housing too closely and crowding than by the opposite.

While we do not believe in a "balm for all ills," yet we find the following a good preventive and treatment for roup, canker, chicken pox, etc.: Magnesium sulphate, 10 ounces; magnesium oxide, 1 ounce; sulphate of iron, 2 ounces; ground ginger, 2 ounces; sulphur, 3 ounces.

Give one tablespoon in moist mash to 12 birds each morning for three mornings and discontinue till needed.

The magnesium sulphate acts on the intestines, the magnesium oxide on the kidneys, sulphate of iron acts on the blood, the ground ginger stimulates all organs, and the sulphur is a general antiseptic. This is therefore a good system treatment or tonic for the fowls. For severe cases the dose mentioned above should be increased.

No one, however, should ever try to control a disease without first removing the cause. If your birds have a cold, first remove the cause, then administer treatment.

During the fall season all grains, weed seeds, etc., ripen, so that if the birds have free range they have an abundant supply of food, but the ration is often unbalanced for the ration usually contains too much fat producing elements with not enough tissue forming elements. If the birds have range on clover, alfalfa, cowpeas, etc., the ration is more apt to be balanced, but if they range in a corn field, the hens should be fed protein in some other form, for without it, the hens will get very fat but produce no eggs.

Get all pullets to laying before cold weather. If you do not, it will be hard to get them to lay during the winter. Pullets which lay in the fall make bet-

ter breeders in the spring than those which wait till spring to begin laying. —Missouri Poultry Experiment Station, Mountain Grove.

NATIONAL EGG LAYING CONTEST

There is much interest in the national egg laying contest being conducted by the Missouri state poultry experiment station at Mountain Grove.

The ten highest pens for the eleven months in the national contest are as follows:

Pen 21, S. C. White Leghorns, England, 882 eggs.

Pen 1, S. C. White Leghorns, Pennsylvania, 806 eggs.

Pen 19, S. C. White Leghorns, England, 805 eggs.

Pen 75, Rhode Island Whites, Illinois, 786 eggs.

Pen 74, S. C. Reds, Pennsylvania, 745 eggs.

Pen 3, S. C. White Leghorns, Pennsylvania, 736 eggs.

Pen 29, Black Leghorns, Georgia, 733 eggs.

Pen 43, White Orpingtons, Wisconsin, 722 eggs.

Pen 76, Rhode Island Whites, New Jersey, 721 eggs.

Pen 8, S. C. White Leghorns, Kentucky, 708 eggs.

The five hens which have the high-

VEGETINE Makes Bank Balances

We can save you from ten to twenty five per cent on your feed bills. This means the difference between success and failure in the chicken business.

We have a wonderful new poultry food that contains more protein than Bran, which sells at a price thirty-five to fifty per cent cheaper than Bran. Write for circular "Food for Thought and Feed for Chickens," which tell all about this great money saver.

Mr. Kline of Burbank, Cal., one of the most successful poultrymen of Southern California, says:

"I have been using VEGETINE for the past four months on my whole flock and as far as I am able to determine at this time I am fully convinced that it is a saving in food price. We have gotten up to and above normal egg yield during the time at an appreciably lower cost."

MACHINERY

USED RANCH MACHINERY.

Ranchers, attention! Following prices just to give you line on how much we can save you, with 15 years' experience. You will find our prices absolutely cheapest good material can be produced for and guaranteed.

USED WINDMILLS—WINDMILLS NEW 8-ft. steel aeromotor, steel tower, complete, \$30; 10-ft. steel direct mill, \$18; 10-ft. wood mill, fine, \$10; 10-ft. steel stir, \$25; 12-ft. steel mills, \$39. How's this? 8-ft. aeromotor tower, piping, 3000 tank and stand, complete, at \$58, or \$68 on cars.

USED TANKS—TANKS NEW Speaking of tanks; our books show we have sold over 6000 in the last 15 years. This experience should be worth something to you.

FEW PRICES.

Redwood, 1000, \$13; 2000, \$19.50; 3000, \$25; 4000, \$29; 5000, \$35; 10,000, nearly new, \$55. 25,000, with 20-ft. stand, \$75; 35,000 redwood, 3-inch material, 40 ft. stand, finest in Los Angeles, \$130; 50,000 with stand, \$250. Wouldn't this be fine for irrigation subdivision or fire protection for small town? Be quick, as these big tanks won't last at these prices. The last one quoted cost \$980 and is as good as new now. We manufacture new galvanized tanks—1000, \$19.50; 2000, \$29.50; also wagon tanks, irrigating pipe.

ENGINES—ENGINES

1½-h., \$23; 2-h. Fairbanks, with jack, \$55; 3-h. R. & V., \$55; 6-h. Olds, \$68; 6-h. auto engine, \$25; 12-h. Stover, \$175; 11-h. White & Middleton, \$175; 28-h. Lambert, \$275; 50-h. Lambert, \$600.

PUMPS—PUMPS—PUMPS

2-inch horizontal, new, \$25; 3-inch, \$29; 4-inch, \$39; 2-stage, 5 horizontal, nearly new, cost \$300, sell for \$125; 8-inch single, \$90; 10-inch, \$90; 2½, new, \$35; No. 3, 2-stage, \$35 4, \$40; two 5-inch Krogh verticals, choice, \$48. How's this? No. 6 centrifugal pump with 45 ft. shaft, bearings, complete, \$90; 7-inch vertical Krogh, nearly new, \$95. Two-stage verticals 3-inch and 5-inch. New, 6-inch rotary, \$50. Why pay three times these prices for new ones when these pumps are right? Did you ever stop to think your new pump you buy will be "second-hand" in few months, but not necessarily worn out?

USED RANCH MACHINERY

Mowers, \$15 to \$25; mouldboard and disc riding plows, \$17 to \$29; fine hay rakes, \$15 to \$18; 6 gang disc for tractor, ½ price; beet seeder, \$29; \$160 Superior grain drill, \$75; 12 disc cultivator, \$19.50; \$40 clod crusher and roller, \$19; 3 gang 3-in. mouldboard plow, \$17.50; balers, headers, scrapers. Anything, everything ranchers need.

BOILERS, PIPE, FITTINGS, ETC. Notice—Have every article we advertise or customer's name sold to. We do no fake advertising. Why not trade us what you don't want for what you need? If we haven't what you want, can find it for you quicker and cheaper than you can. We buy first-class used machinery, if price is right. No junk or stolen machinery wanted. DEMMITT CO., 120 N. LIVE STOCK

Big Type Poland Chinas—I have an extra good lot of strictly high class young boars from three months to one year old that are fit to head any herd anywhere. Visitors say they are the best they have seen. They have the large size, the good hams and shoulders, the strong arched backs, great length and depth of body, plenty of smoothness, mellowness and quality—in fact, they have two good ends and a good middle, are good lookers and money makers. Their dams are either from Illinois, Iowa or Missouri, or they are from dams whose sire or dam are from these states. These boars are sired by Iowa Wonder who will weigh over 1000 pounds in show condition. He is a son of a WONDER, the greatest Poland China boar living or dead. These young boars carry the stamp of their sire and will sire pigs that will please you. Satisfaction guaranteed in every particular. I am overstocked. I have boars galore. I will sell them at extremely low bargain prices. No females for sale at present. The book on "THE HOG SUPREME—THE POLAND CHINA" will be sent to you free for the asking.

Yours for the BIG TYPE—the kind that grow faster and larger and have more pigs. Geo. A. Smith, Corcoran, Cal.

Billiken Herd—Pure bred, pedigreed O. I. C. Swine; the big white kind. Ready for immediate shipment; weaned pigs of both sexes; pairs and trios; mated not akin. All these pigs are from big type stock, of extra heavy bone; weight, with early maturing quality. Immunized against hog cholera; crated and registered free. Write for descriptive circular and price list. C. B. Cunningham, Mills, Sacramento County, California.

Del Dayo Farm (Old Haggin Bottom Ranch) Registered Berkshires, both sexes and from weanlings to one year old. Now ready a few choice Gilts safe in pig and some very choice 10 mos. old Boars and every sale absolutely guaranteed satisfaction. Stephen S. Day, Sacramento, Cal.

Wanted—Holstein cows; 5 to 25 well-bred, heavy producing, carrying first to third calf. Must be fine dairy type, marked like purebreds and bargains for cash. Want for Tulare County ranch. R. H. Whitten, R. D. 5, Box 646, Los Angeles.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Breeding. BERKSHIRE HOGS. Finest herd in the state. All ages for sale. A. B. Humphrey, proprietor, Mayhews, Sacramento Co., California.

Cattle Instruments of every description at the right price to be had at O. J. Weber Co., manufacturers and importers of Machinery, Saws and Appliances for the Dairy and Creamery, 759 So. Los Angeles St., Los Angeles, Cal.

Thoroughbred Poland China Boars of large type for sale. Buy at home and save express. Prices reasonable. For further particulars write to Maywood Colony Nursery, Corning, Cal.

Blue Ribbon Herd Duroc-Jersey Hogs. Service Boars and Bred Gilts a specialty; also boar and two sows, not related. Meet me in S. F., 1915, prices. John P. Dagg, Modesto, California.

DUROC JERSEY BOARS

Trios of boar and sows not akin of the best blood lines at reasonable prices. Write me. L. L. DeYoung, Sheldon, Ia.

est records for the eleven months are as follows:

Hen 129, Pen 21, S. C. White Leghorns, England, 214 eggs.

Hen 2, Pen 1, S. C. White Leghorns, Pennsylvania, 206 eggs.

Hen 277, Pen 43, White Orpington, Wisconsin, 200 eggs.

Hen 131, Pen 21, S. C. White Leghorn, England, 196 eggs.

Hen 73, Pen 13, S. C. White Leghorn, Pennsylvania, 194 eggs.

The five highest pens for September are as follows:

Pen 74, S. C. Reds, Pennsylvania, 94 eggs.

Pen 76, Rhode Island Whites, New Jersey, 91 eggs.

Pen 73, S. C. Reds, Missouri, 86 eggs.

Pen 35, Anconas, New Jersey, 80 eggs.

Pen 21, S. C. White Leghorns, England, 79 eggs.

The total number of eggs laid in this contest for September was 2871.

The cup was won by Pen 73, with a record of 94 eggs.

DUCK NOTES

"Don't keep two or three different kinds of ducks. Choose one variety and breed for quality.

"Don't try to raise ducklings on whole wheat, cracked corn, or commercial chick feeds. If used at all these feeds should be well cooked for ordinarily ducks do not consume enough grit to grind dry grain.

"Don't try, by mixing it with their food, to force ducks to eat more grit than they want.

"Don't omit fresh vegetables and green stuff from their diet.

"Don't be afraid of overloading. Ducks should be fed four or five times daily.

"Don't allow the feed to stand from one meal to the next and expect ducks to be satisfied with it.

"Don't give ducks sour feed, as it is likely to cause convulsions.

"Don't forget plenty of clean, fresh, water, and give them a chance to rest in the shade."

Questions and Answers

THE EDITOR

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Not Squash Bugs

I send two bugs, one rather small, steel blue with red spot in middle of back, the other somewhat like the ordinary squash bug with orange colored band around edge. What are they?—Subscriber, Manhattan.

These were referred to Prof. H. J. Quayle, entomologist with the citrus experiment station, Riverside, and he replies: "The larger insect which you thought might be the so-called squash bug is known as the red bug and has the scientific name of *Largus succinctus*. This is one of the species of the family pyrrhocoridae. It is not therefore a member of the squash bug family, or Coreidae. There are a number of different species, as you infer, of the squash bug family. The smaller specimen of steel blue color with a red spot on the back is the young or nymph of the insect named above. The two families mentioned are closely related and some of the species of one very much resemble those of the other. The insect which you enclose is of no very great economic consequence."

Stick Tight Fleas

Please inform me how best to rid hens of stick tight fleas. We have sprayed the houses with the refuse from our acetylene generator. I think the only live fleas are on the hens.—Subscriber, East San Diego.

The stick tight flea is one of the most persistent of the flea tribe and can only be gotten rid of by the most radical measures. As the fleas make their home in the soil, the soil as well as the houses and birds must be treated. I would try spraying well with strong salt water, or you might scatter quantities of salt, and then turn the hose on it, spraying till every bit of salt is dissolved and the ground soaked. Clean the nest boxes thoroughly with the salt water, and paint them and the roosts with corrosive sublimate.

To remove the fleas which are on the bodies of the fowls touch each flea with corrosive sublimate diluted with alcohol. You can use a feather, or, better still, a child's paint brush, for the purpose, but be very careful not to get any into the chicken's eyes or your own or into their mouths. It is a very deadly drug, but is sure destruction to every flea it touches.—J. K. A.

Purchase of Water

A makes agreement to sell to B so many days run of water from his pumping plant each month. How long must such arrangement continue before B acquires a water right? What steps should A take to prevent B acquiring said water right?—Subscriber, Wasco.

B would not acquire a water right, as his contract is merely one of purchase and by the purchase he acknowledges the superior right of A.

Keeping Old Hens

I have about 40 hens, from 17 months to two and one-half years old. They have all been good layers. A few have their new feathers; others

are just getting them. I get from eight to 11 eggs now. Would you advise me to keep them or sell them? I hear that old hens will not lay until spring.—Subscriber, Santa Rosa.

If the hens have been good layers it is probable that many of the yearlings are worth keeping. As to hens past two years of age there is a good deal of doubt. An occasional individual is a profitable layer after the second year, but as a rule they may safely be culled out. If your hens are Leghorns you might try the color test. Pick out those with bright yellow legs and creamy ear-lobes and put them by themselves. These are the hens that are not laying. Then pick out those with the palest legs and ear-lobes and put them by themselves. They are your best layers, and are the hens that are latest to molt. You will then have three lots, but the hens with the pale legs are the only ones you can be sure are worth keeping. You might at the same time try the pelvic bone test. The hens whose pelvic bones are stiff and so close together that you can put but one finger between them are the hens that are not laying, and a Leghorn that is not laying by the first of November is more than likely not to lay till January or February. A 25 per cent egg yield in October is not bad for old hens, but you can improve it by judicious culling.—J. A. K.

Slow Feathering and Foot Trouble

The query here answered has been lost but doubtless the inquirer will see the answer.—Edit.

Slow feathering shows that these birds have not the strong vitality they ought to have. The trouble in the feet may be rheumatism from running in the wet grass or from damp coops or runs, or it may be bumblefoot, which is caused by a bruise on the bottom of the foot or by splinters, bits of broken glass or some other substance that has punctured the foot and caused infection. The first thing to do is to look over the range and houses and find out the cause. If, on examining the foot, you find an abscess containing pus, it will need to be opened and washed out with peroxide. If there is no abscess, but simply soreness and swelling, try soaking the foot twice a day in hot witch-hazel. When you have soaked it as long as you care to, rub the swelling with carbolated vaseline and wrap in a bandage to keep from becoming dry. If many of the flock are affected you can hardly take time for individual treatment and will have to depend on the removal of the cause. See that the birds are in dry, sunny coops, and if possible confine them in a dry, clean run until they have recovered.—J. A. K.

"Waxing" Oranges

I am told that California orange packers use a wax solution as a wash and then polish the fruit. Please give me the formula, also tell me where the machine for doing the polishing may be secured.—Subscriber, Frost Proof, Florida.

Our Florida subscriber has been misinformed regarding the waxing proposition. The natural bloom of the California orange gives to it its attractiveness.

"The Children's Hour"

Protect the children from the draughts. Keep the damp and chill away with a good oil heater.

Inexpensive to operate — easily carried from room to room. Smokeless and odorless. Dealers everywhere.

For best results use Pearl Oil

Standard Oil Company
(California)
Los Angeles

Perfection Oil Heater

The "S-B-U" High-Pressure Power Sprayer

Built along advices of Horticultural Experts and prominent growers, to do "high pressure" work with wonderful results after fog-sprays and fumigation had failed.

Own your own High Pressure Spray Rig and be in a position to SPRAY WHEN YOU SHOULD. The right time to spray is at period of incubation or hatching of Tree Pests, don't compel yourself to rely on hired spraying or fumigation. Write for Circulars "S No. 2".

The Household Department

YOU CAN HAVE 'EM

Oh, other skies are fair, no doubt,
And other seas of dimpled blue
Their silver pennants gayly flout,
And glad the days are, through
and through!

In other far, sweet spots the dew
Imprints its kiss upon the flowers
And linnets sing the way to woo,
But I prefer this burg o' ours!

From other shores low hills arise,
With templed sides and greening
crest,

In other harbors, fair of guise,
White wings of ships find place to
rest.

But somehow these don't meet the
test,
These other havens, rockbound, sheer,
One spot of all to me is best—
I'm sort of glad I live right here!

THE END OF THE CHASE

The notebook of a New York man whose business takes him through the rural districts of the West and South contains this transcript from real life:

"We heard the deep baying of a dog soon after we left the turnpike. He seemed to be following a trail through the dense woods on the hills beyond the ravine which extended far to the north in a line parallel with the narrow road. The short, quick yelps made little impression upon me, for I was a poor sportsman, but Si Bailey, after pausing to make sure that the sounds from the dog were familiar, urged the horse into a more rapid trot.

"That's Lije," said he, bringing his hand down vigorously on his knee and leaning forward in his excitement. "He's on a good scent this time. I c'n tell by the way he barks."

"Who is Lije?" I asked.

"Lije is my dog," he answered proudly, "an' the best coonhunter in this part of Indiana, if I do say it myself. If you've got time to stop off a little while, say an hour or such a matter, I shouldn't wonder if I'd be able to show you some fun. It won't be long now till Lije'll have him treed."

"He urged the horse into a still swifter pace, but the mud was deep and the wagon infirm, and at best our progress was slow. We jolted along through ridges of soft, yielding clay and hollows of water and slush till the second milestone had been passed. The wagon had been creaking and groaning dismally throughout the last mile, and just as we crossed the fourth large rut that had been washed out at right angles to the highway the crisis of its agony was reached, and it collapsed with many a lamentation from axle, spring and shaft, Si and I extricated ourselves from the ruins, which were already pretty well imbedded in the mud, and looked around over the leaden landscape.

"We're in for it now," said Si. "We can't go any further till this wagon is mended. I don't mind the breakdown, nor the work, an' I don't suppose you'll be much put out, but I do hate to miss that coon. That's my house yonder. Come on. I'll send one of the boys down for the horse and wagon, while I go after Lije."

"Si lived just across the heavy swell in the twenty-acre meadow which extended from the roadway back to the ravine. His house was visible from the highway. It was a small, unpainted house, and it stood in the middle

of a muddy, littered yard. The picket fence surrounding it was broken here and there, and the gate hung dejectedly on one hinge. The only live thing visible around the dreary habitation was a little girl, who was gathering up broken pieces of railing from the remains of a woodpile at the rear of the smokehouse. She saw us as we passed through the gateway and hurried toward us, leaving a trail of wood as she came. She was a very little girl the plainness of her countenance being accentuated by traces of much weeping.

"Oh, pap," she cried, her grief breaking out anew; "I'm so glad you've come. Mother's had another spell."

"Si passed his heavy hand over his face.

"She has?" he said. "Who's with 'er now?"

"Mis' Johnson. Mr. Johnson's gone for the doctor."

"I must go in an' see 'er," he said. "Come on in, Sir. I'll be ready in a minute."

"Si went around to the kitchen door, and I followed him. Another little girl sat on the doorstep, tying together pieces of coarse strings in heavy shoes. I sat down beside her, and Si went through the kitchen into the next room, where his wife lay. It was one of those warm, oppressive days that come now and then in the middle of March, and through the open doors I could see the woman plainly. It needed only one glance to tell me what the 'spell' had been, for consumption was written in every line of her emaciated face.

"Si went up to the bed and took her thin hand in his.

"How're you feelin', Sary?" he asked.

"She was very weak, and her only reply was a look of tenderness that overspread her homely features and transformed them, for the moment, into something beautiful. He stroked her black hair and leaned forward as if about to kiss her, but just then there came the sound of excited voices and the tramping of heavy feet on the boards outside, and he straightened up and looked around guiltily.

"Si, Si," some one called, and Si hastened to the door.

"Lije's baying was still heard in the woods, and a delegation of three stalwart young fellows had been sent over to bring Si to the scene.

"Get your gun, Si," they shouted. "Lije's got 'im."

"Si's nostrils dilated with sudden energy and his eyes flashed.

"All right," he said. "I'll be there in less 'n no time."

"His wife watched him silently as he took down his gun from its place in the corner, but when he started out she rallied her waning strength and called him back.

"Si," she said faintly, "you mustn't go. I'm very low—I ain't apt to last the day out. Don't go, Si."

"Si Bailey paused and looked at his wife wonderingly.

"Why, Sary," he said, kindly, "I'll be back in half an hour. You'll be all right. You're a little down today, I guess. Lije wouldn't know what had

HOME MADE ACETYLENE

Safest Light and Cooking Fuel

Insurance Records Prove It

Insurance records show that the misuse and abuse of city gas, kerosene and gasoline caused over 100,000 fires in six months. While the misuse and abuse of acetylene caused but four fires during the same period. And there are over a quarter of a million Country-Home-Acetylene-Plants in use. A mighty fine showing for acetylene.

A hundred feet of acetylene makes more light than a thousand feet of city gas. For this reason acetylene burners have small openings—so small that not enough gas could escape from an open burner—in a whole day—to do any harm whatever.

Also acetylene gas is not poisonous to breathe—you would suffer no harm in sleeping under an open unlighted burner.

Also, acetylene burns with no odor whatever—but acetylene from an unlighted burner has a strong pungent odor which immediately attracts attention.

Also, acetylene lights are permanently fastened to walls and ceilings—they cannot be tipped over.

Also, the acetylene producing stone, Union Carbide, won't burn and can't explode.

For these reasons insurance authorities have pronounced acetylene safer than illuminants it is displacing.

Our advertising literature tells all about the best way to make acetylene for country home use, and how it is used extensively for cooking as well as lighting. Just address

happened if I wasn't there to see him catch that coon.'

"Si started out in hot pursuit of the three men, who were already half way across the field. In lieu of something better to do I ran along after him.

"We did not get back in half an hour. The tree in which the coon had taken refuge was large and knotty, and the task of felling it not easy; besides, the coon was strong and fierce when brought to bay, and there was a long and bitter struggle before Lije was victor.

"It was two hours later when we reached Si Bailey's house again, and the shadows of the sombre March evening were gathering thick around us. A single light gleamed in the kitchen window, and through the gloom I could see a horse and buggy standing just outside the gate. The men who had participated in the sport had accompanied us home, and the boisterous, noisy crowd filed into the yard in advance of Si, who stopped every little while to pat Lije affectionately on the head.

"The little girl with the broken shoestrings came out to meet us.

"Oh, pap," she moaned, 'mother's gone!'

"Si dropped the coon, which he had carried home, and staggered back.

"Gone!" he repeated.

"Dead," she sobbed. 'She left a goodbye for you.'

The light from the kitchen window fell athwart Si's white face as he stood there, gaunt and motionless. His lips twitched, but he made no sound.

"The voices of the men were hushed. Lije sniffed at the enemy he had vanquished. The little girl cried softly. Within the house all was very still."—New York Times.

IDEAS FOR THE COOK

Written for the California Cultivator
By Isabel Cottle

Breakfast

Farina with Cream and Bananas
Friszled Beef Corn Muffins
Preserved Pears Coffee

Lunch or Supper

Vegetable Soup
Baked Rice with Cheese
Creamed Spinach
Apple Dumplings Tea

Dinner

Oyster Pie Carrots
Spiced Beans Hot Rolls
Mocha Cake Fresh Fruit
Coffee

Yankee Oyster Pie

Put one pint oysters, with their liquor, into deep baking dish; add one and one half tablespoons butter, and heat enough to melt butter. Stir in one tablespoon corn starch dissolved in one half cup cold water, salt and pepper to taste, and a dash of cayenne, also a tablespoon of lemon juice. Have ready a rather rich biscuit dough. Pat to half inch thickness the size of baking dish and lay on top of oysters. Bake until crust is done and lightly browned.

Mint-Glazed Carrots

Wash and scrape three carrots and cut in one-fourth inch slices. Parboil for ten or fifteen minutes, drain, put into a saucepan with one third cupful of chopped mint leaves. Cook very slowly until glazed, and perfectly tender. Serve hot as a border surrounding a mound of green peas.

Spiced Beans

One quart of green beans, half cup vinegar, three-quarters of a cup of brown sugar, one teaspoon salt, one stick of cinnamon, 12 cloves, a small piece of fresh horseradish.

Remove strings from beans, leaving them whole. Cook in salted water until tender. Put sugar, vinegar and spices into a saucepan. Let come to a boil, cover and stand aside for half an hour. Add beans and boil for about three to five minutes, then let them stand for about half an hour before serving. They may be kept warm and served hot.

Prize Mocha Cake

Cream together three-quarters cup of sugar, one-quarter cup of butter, the beaten yolk of one egg and one-half saltspoon of salt; add one cup of flour (sifted) to which has been added two teaspoons of baking powder, then last add one cup of milk, one tablespoon cocoa and beaten white of one egg. Bake in two shallow pans.

The Modern Idea

Get in touch with the world. Farm telephones help business, help farm life—save time and money. A few men in your neighborhood can get together and easily build a local telephone farm line.

**The line is simple, easy to build
The telephone is easy to install
The cost is not excessive
The upkeep is small**

Especially are these things true, when reliable, made-to-last telephones are used. Each man can buy his own telephone, then decide upon the cost of wire, poles and supplies. We will tell you the approximate cost, what material is needed and show you how to put up the line free.

Co-operative farm lines are not a new idea. They are being operated in many parts of the world now. Very many thousands of Kellogg telephones are installed today—many in service for eight or ten years in all parts of the United States.

Kellogg Telephones

Kellogg farm telephones save you money because they are practical and well built, do not get out of order easily, give unexcelled transmission which means that the bells ring properly, that you can hear and be heard clearly and distinctly.

Ask our practical telephone men at San Francisco for our illustrated bulletins that tell in a plain, understandable way how our telephones operate and why they save money.

We will send you these bulletins and help you build your line in any way that we can. Tell us what you want and the conditions under which you will build your line. Write for bulletin 24.

HAY

Under date of October 9, 1915, Seott, Wagner & Miller says:
Receipts for the past week were 2038 tons, the preceding week 2863 tons. The market is firm and has advanced throughout the entire lire during the week and although we quote the top of the market at \$17.00 occasional sales have been made as high as \$18.00, showing that choicer grades are in good demand and prices well maintained. Fancy red oat s seldom seen, No. 1 grade being the best that is offered. The usual export demand continues with occasional inquiries for large quantities for outside points. De-

Citrus Fruit Market

LOS ANGELES, October 13, 1915.

The orange market is a bit easier, owing in part to very heavy receipts of Jamaicas and Porto Ricos and rather liberal shipments from California. All told there are near to 300 cars weekly going forward. Prices are from 25 to perhaps 35 cents lower than a week ago.

Lemons are going forward under ventilation, regular 300 size is holding up to full quotations but 360s and other off sizes are being shaded somewhat.

NEW YORK, Oct. 11.—Eighteen cars Valencia, four cars lemons sold. Market unchanged on oranges; lemons slightly higher on both 300s and 360s. Weather fair.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115 1/2 N. Broadway, Los Angeles.

Inheritance Tax

Do the laws of this state governing inheritance tax exempt property willed by husband to wife or reverse? If not, what is the rate of taxation? If part of the mortgage notes are held by wife and part by husband would all of them be considered property of the husband in case of his death? Does property, real estate, bank account, mortgages, come under the California inheritance tax law when held in other states if testator at time of her death is living in this state? If within a year previous to her death she has deeded property to her son will that be included in the taxable list?—Subscriber, San Diego.

In case of widow \$24,000 is exempt from taxation; in the case of the widower \$10,000. Up to \$25,000 the tax is one per cent in both cases and then gradually increases in percentage. If a mortgage was made out payable to the wife it certainly would not be a part of her husband's estate unless afterwards proven to be. When a transfer is by will or by the laws of succession in this state tax is imposed upon any resident dying possessed of property while a resident of the state. When a transfer of property is made by a resident or non-resident, when such non-resident's property is within this state, without valuable consideration in contemplation of death or intent to take effect after death, such property is subject to the tax as though transfer had not been made.

Naturalization

I am a Frenchman, 38 years of age and have been in California for over a year, and wish to settle in this country and become an American citizen. Would you tell me how I am to set about it? How long must I remain in America before I become a citizen?—Subscriber, Porterville.

In order to become naturalized the applicant must first make an oath before the clerk of the court that he has an intention to be a citizen of the United States and that he desires to renounce allegiance to the state of which he was a citizen. Blanks are provided for the purpose of filling out the details in the office of the clerk of the superior court of any county wherein you may be located or in the office of the district court of the United States. Not less than two nor more than seven years after such declaration of intention he must file in duplicate a petition duly verified, stating a number of details as to his previous life and further that it is his intention to reside permanently within the United States. This petition must also be accompanied by affidavits of two witnesses or citizens of the United States. This petition must show that these witnesses have personally known the applicant to be a resident of the United States continuously for at least five years and of the district in which the affidavit is made at least one year, immediately preceding the filing of the petition and further that the petitioner is of good moral character. A certificate must also be obtained from the department of commerce and labor, if a petitioner has arrived within the United States subsequent to the 29th day of June, 1906, which certificate must state the date, place and manner of arrival in the United States and also the date of filing of the declaration of intention to become a citizen. Thereafter the applicant appears in open court and declares upon oath that he will support the constitution of the United States and absolutely renounce his allegiance to the foreign state. At that time in open court he is subject to an examination as to his qualifications for citizenship, and he must have his two witnesses there with him. No alien may be naturalized, who does not believe in organized government, who is an anarchist, who cannot speak the English language or believes in polygamy. At the time of filing the original declaration of intention the clerk is entitled to fee of \$1, upon the petition for admission as citizen; if the certificate of citizenship is granted the clerk is entitled to \$2; also sums must be paid to cover expenses of subpoenaing and paying witnesses. If after having secured a certificate of citizenship the alien goes to any foreign country and takes permanent residence therein, the certificate of citizenship may be cancelled.

Collecting Wages

What can I do to collect wages that are due me for over 15 months, when it is doubtful if I can find anything to attach? Is a commission man committing a criminal offense when he sold a carload of hay for me last spring and received the money for it, but does not pay me but a very small part? He promises to pay. What action would be best for me to take to secure the money?—Subscriber, Aipaugh.

As to the first matter you might take it up with the labor commissioner for your district, but it is doubtful if after waiting for so long you could

obtain anything except civil relief. As to the second point it will probably depend entirely upon the exact circumstances as to whether embezzlement had been committed or not.

Title

Two years after marriage a man deeds his home to his wife. All cash paid out on it after marriage was money she had earned before marriage. Years afterward she leaves him for immoral conduct, taking the only child with her, asking neither alimony nor divorce and making her home with her parents in California. The home in Florida has little value now, but can she sell it without the husband's consent or signature, neither having lived on it for years?—Subscriber.

It is doubtful if under the laws of Florida a deed by the wife alone would be sufficient in itself to convey good title, although under the circumstances, as stated, a judgment could be obtained quieting the title in the property.

Wife's Property

Under California laws, if a woman's father gives her a home here at his death does her husband have any share in it whatever? Can he come and live in it against her will or have any claim on it at her death? Can she give it wholly to her child?—Subscriber.

The home stated would be the separate property of the wife over which she would have absolute control either to sell or will.

Surrendering Receipts

I bought some property on contract, deed to be furnished by selling company when last payment had been made. When all payments had been made and "Receipt in Full" issued, the selling company had the deed made out as per contract but refuse to deliver it until I surrender to them all my receipts for the payments I have made. Part of the receipts are endorsed on the back of my copy of the contract and part are on separate forms. Is it customary to require the purchaser to surrender his receipts? How can I compel them to live up to their part of the agreement and furnish the deed? There is nothing said in the contract as to the surrender of either the receipts or of the copy of contract which I have. Contract was made out in duplicate, each party holding one copy.—Subscriber.

Legally the company undoubtedly has no right to require the return of the receipts, nor is it customary for the purchaser to surrender his receipts. You could bring suit against the company and undoubtedly procure a judgment requiring it to furnish the deed, but I doubt not but that it would be more diplomatic and considerably less expensive to surrender your receipts, at which time you might request a receipt for the receipts surrendered and thus get your deed with no expense or trouble.

ALFALFA COVER CROP

I notice in a recent Cultivator that some recommend planting alfalfa in lieu of other cover crop in orchards. I suggest that this is a dangerous thing to do unless it is fully intended to plow it within a year, for any cover crop that is allowed to remain two or three years will invite the fibrous roots or feeders of the trees to the surface of the ground. When the orchard is plowed these fibers are destroyed, which is necessarily a great shock to the health of the tree. I destroyed an old apple orchard and I have seen a lemon orchard at La Canada killed by this method. We have had reports from others who have greatly injured their orchards by plowing a two or three-year-old sod. This is reasonable and we believe your correspondents who recommend sowing alfalfa for a cover crop should be cautioned not to let it stand too long.—H. L. Musser, Aggeler & Musser Seed Co.

BULBS

The Morris & Snow Seed Company of 439 S. Main Street, Los Angeles, is issuing its catalog of fall bulbs and tuberous-rooted plants. The booklet gives cultural directions for California and is intended as a planting guide as well as a list of bulbs for sale by the seed company. It has a fund of valuable information and we doubt not it will be mailed upon request.

Caution!

Genuine J. H. Hale peach trees can be obtained **only** from Wm. P. Stark Nurseries, Stark City, Mo. Look for trade-marked wooden tag with Mr. Hale's personal signature as below.

Send for Catalog—Read the Whole Story

On July 22, 1915, Mr. Hale packed an ordinary apple barrel full of J. H. Hale peaches in his Fort Valley, Ga. orchards and shipped them to Stark City, Mo. by express. After traveling 1,000 miles, without ice, without ventilation, in the heat of summer, they arrived as firm as when they left the orchard—only two bruised peaches in the lot. A record no other peach has ever equalled. Read full facts in catalog. Mailed Free.

An Amazing Test—J. H. Hale Peaches Shipped in a Barrel!

A Peach So Solid and Firm It Won't "Squash Down"—Yet Fine, Juicy Flesh—Luscious Flavor—Immense Size—Highest Prices for Fresh Fruit—Ideal Canner

Wonderful Keeper

The J. H. Hale is the peach that annihilates distance. Ship it thousands of miles—it keeps for days—the dealer has time to sell without waste. This means more sales, bigger profits. And its size, coloring, quality and flavor bring **double** ordinary peach prices on the market. Hon. Parker Earle, of Pasadena, kept J. H. Hale peaches 12 days after they had traveled 4,000 miles in the temperature of an express car. They have been sent by Parcel Post from Connecticut to California, back to Connecticut and then to Missouri, and arrived in marketable condition.

For Canning

Sold fresh, the J. H. Hale always tops the market. Yet its heavy, dense, sweet flesh, coupled with its large size, make it the superb commercial peach. For canning it gives a clear, brilliant syrup, holds its round shape, doesn't rag out, and retains the delicious natural flavor. You have **all** the most desirable features in the J. H. Hale. That is why it is proving the greatest money-maker ever introduced in peaches.

What California Growers Say

"Harvested my crop of J. H. Hales. They exceed your ad. in quality and color."—P. Jordan, Los Angeles Co. "The J. H. Hale is king of the peach world. Our trees were loaded. We picked as many as 300 peaches off some trees. Fine flavor, many so large I couldn't get them in a jar with a 3¼ inch opening."—F. G. Baker, Los Angeles Co. "The J. H. Hale are just as you represented."—Charles Torrance, Humboldt Co. "When my J. H. Hales were ripe they were a beautiful sight, large, fine, well colored, fine flavor."—J. E. Redden, Los Angeles Co. "All that is claimed for them, firm as a cling, but much better; finer flavor than Crawfords."—L. L. Cronk, San Bernardino Co. "A flavor our California peaches do not have."—Bensel Smythe, Publisher "Western Empire."

Send for New Free Book—Save ⅓ to ½

We save you money on your tree purchases because you do business direct with the nursery. No agents, no canvassers. Our catalog is our only representative. Gives complete J. H. Hale story, all about Early Rose Peach, Delicious apple—also lists all best apple, peach, pear, plum, cherry, grape, bush-fruits, strawberries, roses, ornamentals, etc. Prices in plain figures. Easy to order from. Our trees pass most rigid inspection laws. Safe arrival guaranteed. Write or use coupon today.

William P. Stark Nurseries
Box 633 Stark City, Mo.

\$1420 Per Acre

From one measured acre, Mr. Hale picked 748 bushels of J. H. Hale peaches, over 95% of the fruit being merchantable, selling f. o. b. farm for \$2.00 to \$2.50 per bushel—a return of \$1420. In car-load shipments, the J. H. Hale peaches **netted him \$380 MORE per car** than Elbertas. Why waste time with uncertain profit-producers when you can get a money-maker like this?

Reserve Your Trees Now

This year our increased volume enables us to quote considerably lower prices on J. H. Hale trees. This together with tremendous interest aroused by its performance in every peach section of the country points to an overwhelming demand. Get your order in early. Write for catalog today. Don't wait until our J. H. Hale trees are all gone.

Another Great Peach—"The Early Rose"

The highest quality in early peaches. Rich, rosy red, wonderfully flavored, and with a peachy fragrance that sold the Southern grown Early Rose in New York for \$3.00 to \$3.50 per crate. More profit than any other peach of its season. Fully described in catalog.

Genuine Delicious Apple—Growers Prices

The national dessert apple, delightfully crisp, aromatic flesh, with an alluring flavor, rightly termed "Delicious." The prime favorite on Pacific Coast. Genuine Delicious apple trees, William P. Stark grown, at lowest direct-from-nursery prices.

Hon. Parker Earle of Pasadena and J. H. Hale Peach Tree

With his associates, the Redlands Heights Ranch Co., Mr. Earle has planted 15,000 J. H. Hale trees near Redlands. He says: "The beauty of the J. H. Hale is, after it has developed sugar and quality it will hold that quality twice as long as any other peach I know. It would go to European markets from California if packed right."

Vol. XLV No. 17

LOS ANGELES: THURSDAY, OCTOBER 21, 1915

One Dollar Yearly

Another Lively Auction of Pure Breds

Hanford, Kings County, is the Site of a Sale of Pure Bred Holsteins from Seven Herds in All Parts of California. McAlister Manages and Rhoades Auctions Successful Sale

SIXTEEN fifty I am offered, who will make it \$1700? This is the very best offering of this sale. Gee Whillikens, it's a crime for such an animal to go at such a low price. It's tough luck but the next bid is sure to take her." And it did, for the next bid was \$1700, made by McAlister & Son for the topnotcher at the Hanford sale. The animal was Wisconsin Daisy of Sleepy Hollow, consigned to the sale by C. C. Lester of Gilroy. The

scene was thrilling indeed. The crowd on the bleachers had risen to its feet and when this magnificent cow was brought into the ring the large number of live stock people who attended the sale was immediately at attention. A moment later four descendants of the cow were brought alongside and it was a beautiful sight which called for immediate applause. When the youngsters were taken from the ring the bidding began at \$600. It went to seven hundred dollars, eight, nine, one thousand, eleven hundred, twelve hundred in one-hundred dollar jumps, and almost as quickly as the reader has run over the same figures. Then the bidding was slower and went by fifties, but steadily upward until seventeen hundred was reached and the top notch sale was made. This topped by \$150 the best sale of a female at Sacramento the week preceding. The average of this sale did not reach, however, that of Sacramento, partly because of the large number of calves and young bulls. The total received for this mother and her four offspring—one of them under three weeks of age—was \$5465. Could there be a stronger argument in favor of pure bred productive animals? Had these all been grades or "stronger constitutioned" animals (so called by some) they would perhaps have brought nearer \$546 than \$5465, or an average of over \$1000 apiece.

There were 163 head sold at the two-days' sale. The total for both days was \$48,120, or an average of \$295. The weather was magnificent and the attendance was exceptionally good. The consignments were made by McAlister & Son, of Chino; C. C. Lester, Gilroy; R. F. Guerin, Visalia; Hewitt & Hewitt, Hardwick; Alex Whaley, Tulare; E. O. Fawcett, El Monte; W. J. Higdon, Tulare.

The sale began soon after nine o'clock Thursday morning and closed at 3 p. m. Friday, everybody feeling

that it had been a very successful sale. A dozen or more young bulls selling very cheaply brought down the average which would otherwise have been much larger.

The auctioneer, Col. Ben A. Rhoades, proved his ability to handle a large number of stock in a very short time and at the same time do justice to both sides. The feeling generally prevailed that the sale was one which was very fair to both buyer and seller. The owners of dairies which are stocked with grade cows took advantage of this sale to buy young pure bred bulls for raising the standard of their dairies. This is an opportunity due partly to financial conditions and every dairyman in the country should take advantage of it and make his stock increase in value with every generation.

TREATMENT OF FROST PROTECTION EQUIPMENT

By R. S. Vaile

FOLLOWING the severe freeze of January, 1913, a large amount of money was invested by citrus growers in frost protection equipment of various sorts. This investment varied from \$30 to \$150 per acre for pots alone. Depreciation of these pots figured at ten per cent gives a direct charge of from three dollars to \$15 per acre. In a period like the past year economy is necessary in every business—it would seem natural for every effort to be made to hold depreciation charges at a normal point. This principle has apparently been disregarded in large measure with smudge pots. The writer has seen large numbers of pots in every district that have rusted tremendously during the past two seasons. Examination was made of 100 pots piled along the side of one orchard, among which 35 were found with holes rusted through. These pots were but two years old. There was an actual depreciation of 35 per cent the second year. How large it had been the first year we do not know, but there is no reason to believe it will

not be fully as high the third with the same treatment.

One of the worst features in this connection is the tendency to not replace equipment that has depreciated in this way. We feel that each year should see a larger area protected but at the present rate in another five years the industry will be no better prepared to cope with a severe freeze than it was three years ago.

One important reason for the lack of attention to this equipment seems to be the lack of knowledge of how to go about the matter. Various paints and waterproof materials have been suggested with which the pots might be dipped. We have made observations of large numbers of these materials and find that none of them have given absolute satisfaction. The best thing that we have seen is fortunately one of the cheapest; namely, pure asphalt applied hot. We have in mind one set of smudge pots which were dipped in hot asphalt over three years ago and have not been redipped since, that seem to be in perfect condition. These pots have been left in the orchard during that entire time filled with oil and out of 125, not one has yet leaked. One could not hope for as good results as this in all cases, and even with the asphalt treatment we feel that some re-treatment should be given every season.

The writer recently observed a method of preparing and dipping pots which he believes is worth the attention of citrus growers in general. It consists briefly of the following operations.

Heating to melt the old coating on the pot. This was done by holding the empty pot over a burning pot. A rack was built above the flame for this purpose and tongs were used to turn the pots until all parts were heated.

Wiping the pot to remove the old coating which was melted. This was done with old pieces of burlap. Where necessary, a putty knife or other piece of steel was used to scrape out small rust pockets.

Dipping the bottom and sides of pot in the hot asphalt. For the purpose of melting the asphalt the ordinary stock feed stove, No. 20, which retails for about \$20 was used. Either wood or coal can be burned in such stoves, giving a cheap, safe and convenient method for keeping the asphalt melted.

As the pot is lifted out of the asphalt a full sheet of newspaper is placed on the bottom and the edges turned up along the sides of the pot to hold the asphalt in position until it is dry. In this way the pot can immediately be placed on the ground in position for refilling or stacked away.

The cost of cleaning and dipping the bowl of the pots in the case observed was, for material and labor complete, a little less than four cents a pot. The treatment of the top of the pot can probably be handled more quickly and cheaply by using some good asphalt paint with a brush. The treatment of the tops in this way would probably cost about three cents more.

In the use of smudge pots one should so plan the work whenever pos-

sible, that the pots will never be burned entirely to the bottom. If one pot to each tree is provided it will usually be possible to rotate the use of the pots so that they are never burned lower than within two inches of the bottom. This seems to be a very important feature in the life of the equipment.

RYE STOPS WASHING.

By M. F. Miller,
Missouri College of Agriculture

The heavy rains of the last summer have shown the great injury to land which may be brought about through soil washing. Unfortunately this washing will continue during the fall and winter on all rolling lands which are left bare. Stack fields are especially subject to fall and winter erosion, and there is much of this land every year which is allowed to stand untouched during the fall and winter. Efforts should be made to sow some cover crop on such land where possible. The use of cover crops is one of those principles of soil conservation which farmers on rolling lands must learn to practice.

Rye is undoubtedly the best cover crop for Missouri conditions, as shown by the experience of the Missouri agricultural experiment station. The man who has never used rye to prevent washing will be surprised at the way in which its roots hold the soil. Even half a bushel of rye sown broadcast and harrowed in during September will give striking effects, although a bushel or a bushel and a half is better. The pasture received from such a crop will pay well for the seed and labor, so that the prevention of soil washing costs practically nothing.

Wheat and barley give an effect similar to that of rye, and the pasture secured is practically as good, but for average conditions rye is to be preferred. Rye is somewhat hardier than either wheat or barley and may be sown somewhat later if wanted only for soil binding.

THE BEST ORCHARD INTERCROP

Written for California Cultivator.

One of the biggest problems that confronts the man who is planting a young orchard, or contemplates doing so, is the selection of a crop for planting between the trees during the first three or four years, that will return the greatest possible cash return to help pay the expense of care and cultivation, and one that will, if possible, be a benefit because of its aid in making better physical condition of the soil and that will add nitrogen to the store already available.

Many different crops have been planted this year. These have been the different varieties of beans, corn, alfalfa, Sudan grass, etc.

What has the experience of the season to teach? We would like to hear from our readers who have had experience. What is the best crop?

CALIFORNIA AHUACATE ASSOCIATION

The California Ahuacate Association announces the following program for its meeting on Saturday, October 23, 1915, at the Hotel Alexandria, Los Angeles:

Educating the Public, Judge Chas. Silent, Glendora; News Items, Prof. I. J. Condit, University of California; Food Value of Avocado, Prof. M. E. Jaffa, University of California; Avocado in Florida and Other Lands, Wilson Popenoe, United States department of agriculture; Dr. J. Eliot Coit, University of California; Varieties, F.

Made from the right crude

The Jury of Awards at both San Francisco and San Diego Expositions found an oil made from California asphalt-base crude, highest in lubricating efficiency. That oil was Zerolene. The fact, too, that such unbiased authorities as a U. S. Naval Engineer, engineers of the Packard and Ford Motor Companies, and others, have also gone on record in favor of oils made from asphalt-base crude—in accord with the decision of the Exposition juries—proves that Zerolene is made of the *right* crude, and made *right*.

When writing advertisers, mention The Cultivator.

O. Popenoe, Altadena; Station Work for the Avocado, Dr. H. J. Webber, director citrus experiment station, Riverside; Things to Be Looked Out For, C. P. Taft, Orange; Foreign Contributions to American Avocado Growing, David Fairchild, department of agriculture; Marketing, E. B. Rivers; Marketing from Mexico, J. C. Bosche, Los Angeles; The Association and Its Purposes, Edwin G. Hart, President California Ahuacate Association, Los Angeles.

Experiments on the extraction of commercial oil from the avocado are being conducted by the University of California at Berkeley, and the University of Southern California. The ahuate association in conjunction with the University of California, has shipped different varieties to Washington, D. C., and Chicago, which will be returned in time to be opened at this meeting. There will be general discussion of papers and items of interest after the afternoon session. An invitation to be present is extended to everyone interested in the ahuate.

The committee in charge of arrangements wants to get in touch with every grower and nurseryman who has fruit or trees suitable for exhibition. Address California Ahuate Association, 917-923 Union Oil Building, Los Angeles. Mr. F. O. Popenoe has charge of the exhibits.

AVOCADO-AHUACATE-ALLIGATOR PEAR

Written for the California Cultivator
By Chas. D. Adams

We are at present in the early and formative period of the introduction, propagation and marketing of a fruit product of great value which we believe as it becomes known will come into the same general use among our own people as it has in those countries where it is native and where it has been grown for centuries.

While it is of tropical origin and until recently was thought could only be grown successfully in such countries, we have now discovered to the contrary, not by theory but by actual practice. We are doing it right here and find we can grow this fruit to perfection in Southern California and Southern Florida. We are now starting out in an industry that has every promise of ranking in the future along side the citrus industry in these states. The American market has possibilities that are surely big enough for the growers of both states and if we are wise we will follow the example set for us by the citrus growers and will not disturb ourselves with questions of rivalry, but rather will combine in efforts to work together for the common good. This the citrus growers have done. The California Fruit Growers' Exchange welcomed a large delegation from Florida when they came here to learn about our cooperative methods, gave them all information possible, even letting them take some of our experienced men to Florida to help them organize on similar lines and to the mutual benefit of growers, both here and there, by great reductions of decay in transit and prevention of demoralized markets.

Let us not set out on an opposite course of action in the beginning of a great industry for both these states. Let us not bring in an element of discord in the question of a name by endeavoring on theoretical grounds to antagonize Florida, the American Pomological Society and, as I sincerely believe, the majority of our own growers. If we do, the only result will be, I am

sure from similar past experiences, that we will not be successful in obtaining the general use of either avocado or ahuate, but will be forced to see our beautiful fruit masquerade under the suggestions of alligator, and of pear, to neither of which it is kin.

English speaking people will not adopt and use the word ahuate, which only those who understand Spanish spelling would know how to pronounce. Avocado they can pronounce according to the spelling, whether quite correctly or not does not signify, so long as it is a word they can and will use.

Let us apply here again the experience of our citrus friends. They made a failure in trying to get rid of the name grapefruit in favor of the much more desirable name pomelo. In this case there was a united attempt on the part of the Pomological Society and of growers' associations and nurserymen, but it came too late. The stamping of the name pomelo on boxes and its printing on letter heads and nurserymen's catalogues was kept up for a long time, but was finally abandoned. These and other efforts were of no avail. The public had acquired the use of the first name, and would have no other.

We are at a younger period in our industry and by all interests working together can succeed in obtaining the use of a better name than alligator pear, but otherwise we shall fail as was the case with grapefruit.

If, as is urged, we are to be guided by the Mexican usage, we have authority for avocado, for it is in use there sometimes, though by no means as generally as the other name, and there is still a third word in use for the wild tree.

But practical reasons are the important ones and now, while it is still possible to win its adoption, let us all unite in the use of the name avocado, a musical and spellable word, and let it advocate for us with the American public the use of a delicious and nutritious article of diet.

STOPPING THE CAR

By George Frank Lord

The other day a friend of ours bought a new car. The demonstrator spent several hours showing him how to run it but somehow failed to give him adequate instructions about stopping. He cautiously, but with much elation, drove the car to his home in the country and turned into the circular drive near his house. Just then it dawned upon him that he did not know what to do to stop. So he went 'round and 'round the drive sweating with desperation until he finally decided to throttle down and apply the brakes until he stalled the engine, and that was the way he stopped. Then he telephoned for more explicit instructions against the time when a circular track would not be at hand.

The modern electric starter makes it easy to start a car and it is equally easy to keep it going. But the first and most important thing to learn is how to stop quickly to avoid collision or somersaults into a ditch. Throttling down the gasoline is not sufficient. Any good car will continue to run on level roads with the throttle down to the last notch, as enough gas gets through the carburetor to maintain a speed of four or five miles per hour. Cutting off the spark obviously stops the explosion instantly. It does more, too, because it leaves unexploded gas in the cylinder, the compression of which exerts a back pressure and brakes the car.

When running at slow speed, the best way to stop is to throttle down the gas, cut off the spark and gradually apply the foot brake. Never use the emergency except in emergencies, or to hold the car after stopping on a steep grade. For an emergency stop at high speed, simultaneously, instantly throw out clutch and apply both brakes hard. When going down long grades it is advisable to use either high or intermediate gear, or if very steep, low gear, cut off spark, reduce throttle to save gas, and apply foot and hand brake alternately for short periods of time to avoid burning.

In applying brakes, remember that the greatest and safest brake power is obtained just short of skidding. Notice a locomotive engineer stopping his train. He applies the air brake until the wheels begin to buck and jump. Then he releases the brake and immediately applies it again. He repeats the process four or five times until he finally eases the heavy train to a stop.

It is the same way with an automobile. Abrupt, heavy braking causes skidding and grinds the treads off of tires. It is both dangerous and expensive.

Another good plan for getting a speeding car under control is to release clutch and apply foot brake to reduce to about 15 miles per hour, shift gear lever to second gear, speed up motor and ease in clutch.

This is a good method when you suddenly meet with bad going and want to feel your way. Second gear is best for city streets crowded with traffic, as you can throttle down to a crawl or spurt a hundred feet when you get the chance.—Vertical Farming.

DIRTY IGNITOR POINTS

If your engine has been in use very shortly previous to the time you experience trouble in starting, trouble may be due to dirty or short circuited points. With a contact ignitor test completely without removing the ignitor from engine as follows: First see that all connections in battery and wiring are firm, then loosen the wire from the insulated stationary electrode and, with switch closed, snap wire across other terminal. If a good spark is produced you are sure battery is giving current.

Next turn engine till ignitor trips and try wire on insulated electrode. If a spark is produced here, the points are short circuited inside, probably by water or carbon. If no spark, the points are not short circuited. Now turn engine again, but stop just before ignition trips. Points are then in contact inside. Try wire again on the insulated electrode. If no spark is produced points are dirty. If a spark is produced the ignitor is all right.

If points are dirty or short circuited, the ignitor must be removed and cleaned. Tests are best made in order given above, as it would do no good to test for dirty points if battery is worn out or if points are short circuited.

With a jump spark system the test is not so easy, but the plug can easily be removed, examined and tried while outside the cylinder. Be sure the plug is dry, as a very fine film of moisture, even though it be gasoline, covering point and porcelain will short circuit a plug. Battery is tested by short circuiting plug on outside before removing from cylinder. For this purpose use screw driver or other tool with wood on handle to prevent receiving a shock.—E. R. Gross, Colorado Agricultural College.

The Best and Cheapest Way to

Control Scale and Fungus

on Citrus Trees is to spray with

Citrus Zeno

(The Standard Tree Spray)

Because

It kills the scale as thoroughly as fumigation.

It destroys the black fungus (which fumigation is not even expected to do.)

It cleans and renovates the tree.

It is not a caustic material.

It is easy to mix and apply.

It is a proven material.

It is being used by many of the largest and most progressive growers.

We operate under state license.

We can show you.

And all this for one half the cost of fumigation.

Citrus Zeno sold in 50-gal. bbls. at \$14.00 per bbl., f. o. b., Los Angeles.

For summer and fall spraying dilute at the rate of 1 gal. Citrus Zeno to 30 gals. water.

POUND FOOLISH

THE California Wine Association sold its 1915 raisin crop to J. B. Inderrieden & Co., independent packers, and this act has aroused considerable feeling among officials of the California Associated Raisin Company, the growers' organization, according to the Fresno Republican. The Sun-Maid Herald, the Associated publication, this month publishes copies of a letter and a telegram sent by Wylie M. Giffen, president of the Associated, to officers of the wine association regarding the deal. This correspondence took place before the raisins were sold but after the wine

you expect to sell your raisins on the 25th of this month to the highest bidder. This necessarily means that they go to the independent packers, as we buy only on the regular contract and their price will undoubtedly be a half a cent higher than ours. By the sacrifices of 6500 growers this organization was made possible, and it seems unthinkable that a great organization like yours should be willing to take advantage of their efforts without contributing your share. Our very existence depends upon the support of the growers and the value of not alone your crops, but of every acre of land you own in this valley depends in a large measure upon our existence. The prosperity of at least 150,000 people depends upon this organization, and today their eyes are upon you, and you cannot afford, and we cannot

Community Cooperation

TRADEMARKED-ADVERTISED MERCHANDISE

R. V. Holland

IN an obscure village "way down South", we'll call it Hawkin's Corner for convenience sake, there lives a little woman who makes a livelihood from the sale of eggs and chickens. Not the common, ordinary, every-day, haphazard varieties, but standard eggs and chickens of known quality.

The reason why this progressive little woman has been more successful than the average producer of these commonplace commodities is the fact that consumers in the locality have become convinced that they can at all times absolutely rely upon the quality of every egg and every chicken sold by Mrs. Parmelia Hawkins.

How can prospective purchasers identify Mrs. Hawkins' products? By her name on them, of course; just as you can identify certain makes, or brands, of automobiles, implements, collars, hosiery, talking machines, food products, and the thousand-and-one other articles you buy and use.

Every egg that Mrs. Hawkins offers for sale has plainly stamped upon it the date upon which it was laid and her name. To every chicken marketed, whether alive or dressed, is attached a neat tag stating that it has been properly fed, carefully inspected, and is guaranteed by Mrs. Hawkins to be a clean, healthy fowl.

It is hardly necessary to add that Mrs. Hawkins is never forced, or even called on, to make good her guarantee. Her one most valuable asset, her good name, backed by her reputation, is on every article she sells and serves as a quality pledge to all purchasers.

Disregarding her natural pride in her name, Mrs. Hawkins cannot, purely from the standpoint of good business judgment and policy, afford to let her eggs and chickens fall below the standards she has created and maintained. They simply must come up to every claim she makes for them. She has quite an investment of real money in the reputation of, and consumer confidence in, "Mrs. Hawkins' Eggs & Chickens", and she realizes that any reduction of quality will necessarily impair or destroy that investment.

Of course it is more difficult to produce quality goods than the inferior sort. Production requires closer attention and at times a little extra expense, but when one is endeavoring to build a business or industry and make a reputation for his or her particular line of products, these things are necessary to the end in view.

Weigh this question carefully: Wouldn't you rather have Mrs. Hawkins' eggs and chickens than those of doubtful quality and unknown origin? Then too, don't you think that this little woman, as well as every other individual and firm pursuing her methods, should have the encouragement and support of the consuming public? Don't they deserve it? Not from a sentimental or sympathetic standpoint but purely on the ground of getting value received for the amount of money expended.

Products of the Mrs. Hawkins' variety are obtainable in every village, town and city in this country, and they cost no more than the unknown sort. They include everything you have any possible use for from hooks and eyes to traction engines. They are commonly known and referred to as standard or trademarked-advertised products.

association had announced it would receive bids.

In the same publication, announcement is made by James Madison, vice president and general manager of the Associated, that steps will probably be taken next year to organize the wine grape growers in an effort to get more than six cents a gallon for the wine contained in their grapes.

The telegram and letter sent by Giffen follow:

Fresno, Cal., Sept. 18, 1915.

Mr. B. R. Kittridge,
Care California Wine Association,
4010 West 14th Street,
New York City.

Mr. Beveridge just informs us that

afford, to have you lend your support to interests inimical to ours.

Wylie M. Giffen.

Sept. 18, 1915.

California Wine Association,
108 Townsend Street,
San Francisco, Cal.
Attention Mr. Wetmore.

Gentlemen:—Your Mr. Beveridge informs us that you have decided to sell your raisins to the highest bidder and will accept bids on the 25th of this month. This necessarily means that your crop will go to the independent packers, as we have but one price, which is, as you understand, 3¼c for Muscats, 3c for Sultanas and 3½c for Thompsons at the time of delivery,

with all they bring more than that at the final settlement to be made a year hence.

The independent packers will undoubtedly pay you a higher price. If you take the figures that we pay at time of delivery, their price will seem much higher, but on the seedless varieties there is no question but what our final settlement will come within about a half cent of what they will offer. I wish I could say to you that I felt that our final settlement will equal what they will pay you, but I do not want your crop on anything but a fair basis. As you well know, we are carrying the burden for the whole community, and the independent packers and the growers that support them are getting the advantage of our efforts without contributing a single cent.

You are familiar enough with the fruit industries of this state to know positively that raisins today would not be worth two cents a pound if it were not for this organization. This is made possible by the sacrifices of 6500 growers, who have put up the capital and are selling their crops on the same terms that we offer you. There is not one of these 6500 growers but what could sell for the same high price that you can sell for if they were free to do so and the organization still existed. In other words it is not because you are more capable than the rest of us, but because you are taking advantage of our efforts that you can get the high price that you get.

It seems to me almost unthinkable that a great organization like yours, for the difference of a few thousand dollars, would take advantage of the efforts of thousands of growers that, as compared with you, are but poor men, and I am writing you this letter with the hope that it is not too late and that you still will think better of the matter and deliver your crop to us on the same terms as other growers.

I wish to say, not as a threat, but as a simple statement of facts, that as surely as you let the temptation to get a few dollars extra stand in the way of what you must yourselves know to be the right thing, there will be a day of reckoning that will cost you far more than the temporary gain will be. The raisin growing district has contributed generously to your welfare in the last ten or 15 years, and there is not one per cent of the entire number of raisin growers, or for that matter the entire number of people living in the San Joaquin valley, but what believe in the California Associated Raisin Company, and regardless of your feeling toward either Mr. Madison or the writer, regardless of any differences that we may have had in the past, you owe something to the community that has done so much for you, and this is a debt of honor which is greater than a money debt, and we can better afford to lose your crop than you can afford to repudiate that debt.

Yours sincerely,
Wylie M. Giffen.

THE VALUE OF BIRDS TO MAN

The true lords of the universe are the insects, according to a zoological article in the Smithsonian annual report on the value of birds to men, in which the author, James Buckland, of London, makes the statement that, although man imagines himself the dominant power of the earth, he is nothing of the sort. Although man has attained predominance over the fiercest and most powerful reptiles, he and his works would be of little avail

GARDEN BEAUTIFUL

The Garden Beautiful in California is the title of the California Cultivator's latest "\$ Series", and before another issue of this paper it will be on sale at the book stores. It's "a great book for the price—worth twice" as one admirer has expressed it. It is written by Ernest Branton, for 15 years a writer in the Ornamental Garden Department of the Cultivator.

The book is beautifully illustrated with text figures and 14 full page plates. Fine large type makes easy reading and the binding is so attractive that the book will make a fine Christmas present.

A review and more extended notice in next issue.

before an attack of insects, which include a greater number of species than all other living creatures combined. Some 300,000 species have been described, while possibly twice that number still remain unknown.

The author says that these hordes feed on nearly all living animals and practically all plants, and multiply

into prodigious numbers in an incredibly short time. Computations show that one species, developing 13 generations a year, would, if unchecked to the twelfth generation, multiply to ten sextillions of individuals, while a single pair of the well-known gypsy moths, if unchecked, would produce in eight years enough progeny to de-

stroy all the foliage of the United States. One pair of potato bugs, he states, would develop unchecked 60,000,000 in a single season, at which rate of multiplication the potato plant would not long survive.

According to Mr. Buckland's article, insects are quite as astounding in their consuming qualities as in their rate of increase; a caterpillar eats twice its weight in leaves a day, and in proportion a horse would consume a ton of hay in 24 hours. Certain flesh-eating larvae consume 200 times their original weight in 24 hours; at this rate an infant would devour 1500 pounds of meat during the first day of its life. It is reported by a specialist that the food taken by a silkworm in 36 days equals 86,000 times its original weight.

Reedley is planning for a fall festival. The date is not yet announced.

LATE FALL PLANTING

Written for California Cultivator
By H. Culbertson

The question is frequently asked what can be planted this time of year. The following will be found satisfactory: Cabbage, cauliflower, peas, turnips, onions, beets and lettuce. To get them started make small furrows and irrigate, planting the seed in the furrow immediately after the water disappears. As soon as the seed is covered make another furrow between the rows and run the water until the under soil is wet. Two days later run water in the same furrows for an hour or so on most soils. When in the right condition, cultivate.

The writer adds to the above the soaking of the seed in water 24 hours. After draining off the water sift some fine dust over the seed, stir well and the seed will be dry enough to handle. The plants will appear in about half the usual time in this way and are very sure to come. Where birds are likely to work on the young plants a little wheat or oats planted the same way a short distance from the vegetables makes them less liable to the bird troubles. The grain should be put in two or three days before the vegetables.

For a fair sized family a garden 40 feet each way is ample for the growing of everything in the ordinary vegetable line. One wagon load of manure each year will keep it in good condition. Add to this 100 pounds of some good commercial fertilizer with at least five or six per cent of nitrogen, and there will be a splendid basis for satisfactory return from the vegetables. Plenty of irrigation and cultivation will do the rest.

THE MANGEL WURZEL

Written for California Cultivator
By H. Culbertson.

Keeping a cow without some green and succulent food during the summer is rather an expensive affair. So much so that many do not do it. The important question is what to grow. This depends on what crops are grown on the farm for feeding. If only grain hay is grown the special feeds to be grown should be different from those grown on the farm where alfalfa is raised. Grain hay, oats or wheat, cut just before the grain is in the milk stage, makes fine cow feed, but is short in the amount of protein necessary for a balanced ration. When alfalfa alone is used there is too much protein. In neither case will the stock eat enough to do their best.

Where alfalfa is used as the main feed the mangel wurzel is good to balance the ration and improve the milk supply. The amount for a cow for a season is about one-tenth of an acre. The soil should be good and well cared for. Planting in February is preferable. The rows should be 18 or 20 inches apart. By closing the cultivator and taking off most of the teeth they can be cultivated with the horse cultivator until the tops get too large. The ground, being well shaded by this time, they do well the most of the season without further cultivation. In the warmest weather they need irri-

gation every two weeks on most soils. When the tops get to be about four or five inches high thin to about one foot apart.

Feed the thinnings to the cow and they will be fully appreciated. The writer thins a small amount each day as the cow can use them. In feeding give tops and all. It is not necessary to cut them when large before feeding. The cow soon learns to bite out what she wants.

When the beets are growing fast and are tender they make a good feed for the poultry. To get them started to eating the roots cut them both ways on one side into squares from an eighth to a quarter of an inch across.

Cows will eat 15 to 25 pounds at a feed twice a day. If alfalfa is used as the main feed bran will not be required. One of the advantages in growing this kind of beet for stock feed is that a large part of the beet is above ground and is easily taken up.

THE ORIGIN OF THE TOMATO

No product ministers more delightfully to the palate of the modern epicure than does the tomato, that luscious, succulent, refreshing vegetable-fruit which gratifies the eye with its beauty of color and form, stills hunger with its meat and assuages thirst with its juice.

The name "tomato" seems to be of Aztec origin, given as *tomatl* by some authorities and as *xitomate* by others, and still persists in some few of the older Mexican town names, such as *Tomatlan*, *Tomatepec*, etc., but the general consensus of opinion among botanists seems to be that the plant and its culture for edible purposes originated in Peru whence it spread to other sections of the Americas. It is certain at any rate that it was known and cultivated for its fruit centuries before the Columbian discovery.

That the cultivated tomato was known to some of the European botanists over 360 years ago is evidenced by the fact that two large varieties were described by Matthioli as early as 1554, but for many years it was only in southern Europe that the value of the fruit for use in soups and as a salad was recognized. It was quite generally used in Spain and Italy during the 17th century, but in England and in northern Europe generally the plant was grown only in botanical gardens as a curiosity and for ornamental purposes. It was seldom eaten, being commonly regarded as unhealthful and even poisonous. This belief probably arose because of the close resemblance of the plant

to its relative the nightshade, or belladonna, and had, of course, no foundation in fact. It was not until the early part of the 19th century that the tomato came into general use as a food in northern Europe and even in the United States. Since about 1835, however, the use and cultivation of the vegetable has grown to such an extent that it has now become one of the most important of our garden crops.

When a successful process of canning the fruit was evolved the tomato industry at once assumed large proportions. It was found that for all cooking purposes the canned fruit was as good as that fresh from the vine, and as a result the tomato has become a staple food the year round, and millions of dollars are now invested in canning factories in the United States, whose chief output consists of tomatoes. From statistics compiled by the National Canners' Association for the year 1914 it is learned that among the tomato-producing states Maryland ranked first with a production of 5,850,000 cases of canned tomatoes; Delaware second, with 1,335,000 cases; Indiana third with 1,295,000 cases. The total production for the whole country amounted to 15,222,000 cases of tomatoes and about 5,000,000 cases of tomato pulp (used in making catsup, sauces, soups, etc.). The total was therefore over 20,000,000 cases of 24 two-pound cans each, or an output of 480,000,000 cans, weighing 480,000 tons and having an approximate value of \$28,000,000. These figures deal only with the canned product of factories keeping accurate statistics. When we remember that perhaps twice as many more are eaten raw and canned by the thrifty housewives and girls' canning clubs, we may get some idea of the importance in our national economy of the garden tomato.

Constant mowing is one of the best means of keeping down the weeds in the yard. Where mowing does not eradicate them, hand work is the best remedy for small lawns, and in the case of large lawns it is best to plow up and after thorough cultivation, reseed.

Too many people sow lettuce in beds and do not thin the plants. It is much better to sow in rows a foot apart and then thin the plants to about eight inches.

B A Producer

Macatawa Everbearing Blackberry, originated by Alfred Mitting in 1909 at Holland, Michigan, a cross between Burbank's Giant Himalaya and Early El Dorado, introduced in 1912, the only true ever-bearing Blackberry known to my knowledge. Upright grower, self-branching. The berry is very large and sweet. Oblong, no core, very small seeds, solid, fruits spring, summer and fall, grand canner, dessert, jam and jellies. Crops between 15,000 to 20,000 quarts to the acre. Send for circular and color plate, and how to grow it. One-year-old plants 3 for 50c, 6 for \$1.00, 12 for \$2.00, 25 for \$4.00, 50 for \$7.50, 100 for \$12.00. Prepaid to your city. Order now. Berrydale Gardens, lock box 685, San Jose, Calif.

COMING EVENTS

SEE the great live stock show. Full particulars are given in Mr. Guilford's article on this page. It is essentially a Western show and in this respect different from the real "International" which was anticipated. Foot and mouth disease has completely changed its character. It is, however, a great exposition of live stock. As it is, the participants are all from the herds of live stock men of Arizona, New Mexico, Colorado, Nebraska, Washington, Oregon, Oklahoma, Texas, Nevada and California. These states have sent 162 beef cattle and 592 dairy cattle.

Sheep and swine, the exhibits of which begin November 3, will doubtless suffer from a similar quarantine order, but a big show is being planned for.

Government foresters and lumber experts are holding a great conclave this week, which is termed "forest week." There are discussions on methods of conserving our forests and of increasing the supply.

The American Aberdeen Angus Breeders' Association holds its annual convention in connection with the exposition beginning next week.

The Red Polled Cattle Club of America holds its annual convention

Tuesday, October 26; also, on the same day the Polled Durham Breeders' Association.

The California Creamery Operators' Association holds its annual in connection with the exposition, October 28, 29, 30. L. M. Davis of the university farm, Davis, is secretary.

The American Milch Goat Record Association holds its annual in San Francisco, November 3.

The American Poland China Record Association annual, November 3.

Romney Sheep Breeders' Association, November 4.

Continental Dorset Club, November 5.

National Swine Growers' Association, November 5.

American Rambouillet Sheep Breeders' Association, November 5.

American Southdown Breeders' Association, November 6.

American Hampshire Swine Record Association annual, November 6.

* * *

The great cattle parade takes place Monday, October 25.

The National Fall Flower Day also comes on Monday.

Thursday of next week is Creamery Operators' Day and Friday is Dairy-men's Day.

Saturday, October 30, will be the world's light harness races.

The Great P. P. I. E. Cattle Show

An Exhibition of Pacific Coast Cattle That Every California Farmer Should See During the Next Two Weeks. Written for the California Cultivator by W. S. Guilford

ON Monday, October 18, the World's Fair Cattle Show opened and will continue until November 1.

It is a strictly Western show, the quarantine regulations preventing the exhibition of cattle from east of the Mississippi River. Had it not been for this quarantine there would have been one of the largest shows ever held. About 750 head are now on exhibit, of which nearly 600 are dairy cattle.

There are some wonderful cattle on display, many of the best individuals of the various breeds to be seen anywhere, and every California farmer will be well repaid for a visit to this show which is a demonstration of the fact that there is no better breeding

ground in the world than the Pacific Coast.

The judging began Monday, October 18, and will be practically finished this week. Meetings of the various breed organizations are being held.

There is a great show of dairy cattle, although some of the biggest California breeders are not represented.

Jerseys

The Jersey classes are particularly strong. A representative of the American Jersey Cattle Club has an attractive booth where literature is distributed and the interests of the breed in general are looked after. W. H. Locke of Lockeford and Guy H. Miller of Modesto have big shows, and Clifford Reed, of Portland, Oregon; Clark H. Embree, Monmouth, Oregon; Ed Carey, Lafayette, Oregon; J. Lynn, Amity, Oregon, are on hand with winners from the shows in the Northwest.

The judging is being done by Thos. Dempsey, of Westerville, Ohio.

There are many high producing in-

Make Your Land Yield Its Full Richness

THERE'S no longer any reason for your being satisfied with the foot-deep yield of the plow. You can easily utilize that wealth of virgin plant food four or five feet below the surface.

You can get bigger, better crops; you can get bigger profits, by subsoiling your land.

Subsoiling breaks up the tight or hardpan soil and encourages long vigorous roots that quickly reach down to the fresh mineral plant food.

Subsoiling aerates the soil and fosters the helpful nitrate-producing bacteria.

Subsoiling gives perfect drainage that helps to keep crops flourishing. Progressive farmers are doing their subsoiling easily, quickly and inexpensively by means of

HERCULES DYNAMITE

In the orchard as well as the field they are profitably using this great agricultural power; all the benefits derived from subsoil blasting for crops, also apply to tree-planting.

Holes made in this manner leave the subsoil shattered and capable of storing more water than would otherwise be possible. The roots are given a more open material through which they can send down their feeders. As a result trees planted in blasted holes develop more rapidly and bear earlier than those in spade-dug holes.

But subsoiling and tree-planting are only two of the many uses for Hercules dynamite on the farm. These and other ways in which it can make your farm more productive are clearly explained in our

VALUABLE FREE BOOK

No matter whether your farm is large or small or what you raise, you should read *Progressive Cultivation*. On request we will forward you a copy without charge or obligation.

GLENN COUNTY FARM BUREAU ANNUAL MEETING

Written for California Cultivator
By Sacramento Valley Contributor

THE first annual meeting of the Glenn County farm bureau was held in Willows Saturday, October 9.

Those most deeply interested in the farm adviser or farm agent movement have been looking forward to this meeting with a great deal of interest, for it was believed that it would be an indication of the success and popularity of the proposition and that from it the future could be forecasted with some degree of accuracy.

The hopes of the most optimistic were more than realized. It was estimated that never before at one time were more of the substantial, representative citizens of the county in attendance at a meeting in the county seat. The leaders in the agricultural development of Glenn are heartily in favor of the farm adviser and the farm bureau centers and are supporting the movement in every possible way. Farm Adviser W. H. Heileman has made a place for himself in Glenn County. He has already done much effective work and is now in position to follow up the things that have been started and be of greater value from year to year.

There was a big meeting in the court house at 10 o'clock in the morning, a "big feed" provided by the ladies, the "associate members" of the various bureaus, at noon, and a bigger meeting at the new Gem theatre in the afternoon. Over 400 people were 'fed' at the Maple Hall of the big new Masonic Temple at noon, and more than twice that number were in attendance at the meetings.

D. C. Cowan of the Bayliss district was re-elected president and S. C. Davis of the Ord district was elected vice president, both by unanimous vote and without other nominations. Four directors-at-large were elected: G. W. Troxel of the Larkin district, W. W. Foster of Codora, S. S. Havenor of Jacinto and A. E. Lindstrom of Ordland. The directors from the farm bureau centers are the various presidents, and are elected in January. These now are Chris Mayhre of Ordland, Wm. C. Saxton of Ord; Henry Giller, Bayliss; N. W. Belleville, Jacinto; O. L. Raper, Larkin; F. L. Burke, Codora.

The afternoon meeting was addressed by Elwood Mead and Harris Weinstock on rural credits and land colonization, and all were urged to not only vote for the rural credits amendment to the constitution, but to see that all their neighbors do. Mr. Mead told of the success of land settlement in Australia where there were the same difficulties and many similar conditions. The turning point in the success or failure of many who buy land in projects comes at the time when the money brought to the country is exhausted and before his development work has progressed sufficiently to make a satisfactory income possible. If some financial aid is available at that time, the money and time already spent will be safeguarded and success

is sure, but if this help is not obtained a proposition that would otherwise be a success may fail. Such help as was given by the state in Australia it is the purpose of the rural credits amendment to make possible here.

While many do not realize it, the percentage of successful intensively cultivated farms on the Sacramento Valley irrigation project and the Ordland project in Glenn County is probably greater than on any other irrigation projects in the United States where the length of time the people have been on the land is considered.

Some have failed on both projects, either from lack of ability or capital or both, and it is natural that more should be heard of these about the community than of the man who stays at home and works his land and cares for his stock and is busy from morn-

ing to night. The only way to find out about the successes on an irrigation project is to go out and hunt them up on the land where they are at work. The failures and "near failures" are always to be found in town talking about their troubles—or on the road.

The same factors tend to make success in the Sacramento Valley as in Australia, and the same type of settler who failed there is a failure here. Those who have sufficient capital, know the farming business, read good farm papers, and will work—succeed—and those lacking these qualifications do not.

Great things for the development of California are to be expected from the leadership and work of Elwood Mead, who is now in charge of the department of Rural Institutions in the University of California.

Some of the things that the Glenn County farm bureau is at work on are: cow testing associations, swine growers' protective association, more and better corn campaign, silos, test of bean varieties, Sudan grass, investigation of marketing grain in bulk instead of sacks, better distribution of telephone and power facilities. The California Cultivator is recognized as a powerful influence in the upbuilding of California agriculture and its interest in the farm adviser movement is greatly appreciated.

AUTO FOR POWER

A subscriber recently requested information as to methods of using the auto to generate power for use on the farm. We asked for suggestions. The following is from H. F. Burbank: "Your question in your last issue of how to draw power from an auto for ranch work suggests the following sketch but I do not know if it would be satisfactory or not.

"This outfit could be set at floor level or a little above and then use an inclined plane to back up onto it. I believe the friction of the tires and pulley would develop a lot of power, the weight of the car giving the friction which would be no harder on the tire than ordinary road work, if as hard. I too, wish to use an auto to run a small feed cutter and so submit this and beg suggestions or any information on the subject of using an auto for farm power.

In addition to the above a Los Angeles subscriber, Mr. A. B. Shaw, submits the following which he has clipped from a daily paper: After driving a 1912 touring car more than 20,000 miles over the rough roads of Saskatchewan, A. W. Bell, a native of Saskatoon, conceived the idea of putting it to work on his farm. His theory was that if the car could stand three years of traveling over the so-called roads of that section of the country, it could go a step better and do the practical work.

The auto was converted into a tractor by the simple arrangement of putting in an extra axle under the frame two feet in front of the rear axle of the car, on which were placed two

binder wheels. After removing the rear wheels of his car Bell replaced them with small sprocket wheels which were connected with large sprockets on the drive wheels by a chain. This reduced the speed of the car and gave it more power.

Bell states he was able to seed 30 acres a day or harrow from 60 to 70 acres with automobile. By drawing the 12-inch bushers, he managed to break five acres of soil a day, or the equivalent of the work done by six or eight horses.

The car consumed just 70 gallons of gasoline to put in the crop, while the cost of horse feed alone would have more than doubled the expenditure. The saving in time and labor was another important item.

It took less than an hour to change the rigging of the car, so that at any time when its owner desired to make the trip to town all that was necessary was to take off the farm equipment and transform the machine into a touring car.

AN AUTO POWER THRESHER

Written for the California Cultivator

Necessity may be the mother of invention, but ingenuity must also be given some credit.

I saw an outfit at work in Yolo county the other day that is surely entitled to a prize for making the best of the conveniences at hand.

A small threshing outfit was being operated by two men. A lot of tangled grain that had been cut by a mower and bunched was being threshed. The crop was on rich land and there was evidently a heavy crop.

And the thresher was being run by automobile power! A pulley had been fastened to one hind wheel, the wheel jacked up, a belt connected to the

pulley on the auto wheel and the drive pulley of the thresher—and there you are.

Everything seemed to be working well and a good job was being done.

BLACK EYE BEANS

We often have requests for information as to where the most of our black eye peas or beans are sold, especially in view of the fact that but few are consumed in California. We note the following which appeared in a recent Florida Times Union:

"The black eye pea, or black-eyed pea, as the dictionary has it, is unknown in the North, but used in great quantities in the South. So large is the demand in Florida that the three distributing points of Jacksonville, Tampa and Pensacola receive about 25,000 bags a year on an average at a valuation of \$4 a bag, the supply coming principally from California.

"It is a favorite food among the negroes in turpentine and logging camps, preferred by them in fact to any other staple article of food; particularly when mixed with rice in a dish known by the singular name of 'hopping John.' It has been found invaluable for conferring energy and enabling the laborers to sustain protracted effort. It is also found on hundreds of tables among the white population.

"Why though should \$100,000 or so be sent to California every year for an article that could be grown in great profusion in Florida? The answer is that the California black-eyed pea will keep as long at least as a year in storage, dry and free from weevils; the Florida product is attacked by weevils soon after it is gathered and in a short time is alive with the insect.

"Evidently, if it could be preserved from the weevil this pea would be a great 'money crop' for this state. It is a tropical vine and the climate of Florida is exactly suited to it. The California article is said to be rather larger than that of this state, but that is mainly a matter of seed selection. There is demand for it in other parts of this section, but no Southern state is able to compete with California in its production—at least, the weevil attacks the crop of every Southern state.

"Some five or seven years ago only a few carloads of these peas were imported from California into Florida. They were then quoted at one dollar a bag less than the price for Lima beans or pea beans. Now Florida alone receives from the Pacific coast about fifty carloads of 500 bags each a year, and they sell for \$1 a bag more than the other leguminous foods mentioned. It was soon discovered in the trade that the Pacific Coast product is weevil-proof and there has been considerable speculation as to how this immunity was secured. Investigation has developed the fact that black-eyed peas are subjected to a temperature of 125 degrees for eight or ten hours, or of 140 to 150 degrees for a shorter time, all the eggs, larvae and adults of the weevil will be destroyed, provided the process is properly carried out. If through a chamber heated to 180 degrees on a belt conveyer a temperature fatal to the weevil in all its stages will be reached throughout the mass in from twenty to thirty minutes, provided the peas are not deeper than three or four inches, or the depth may be greater if they are in trays provided with wire netting bottoms."

RAPID INCREASE IN RICE GROWING

Approximately 34,350 acres were sown to rice in California in 1915 according to government estimates. This is more than double the acreage of last year and is a remarkable increase in the three years since 1912, when the industry began in a modest way with the planting of 1400 acres on adobe soil near Biggs in the Sacramento valley.

At present the greater part of the California rice crop is grown on black adobe soil, which is approximately 50 per cent clay and very close and compact. The Sacramento silt loam, found over large areas in the eastern part of Colusa county, is well adapted to the crop, which has also been successfully grown on the Willows clay and on the Alamo clay-loam adobe. In general it may be said that rice requires a clay soil with an impervious subsoil, lying in level tracts and capable of good drainage. Shallow soils are preferable because less water is needed to submerge them.

In 1913 the average yield from the 6000 acres in rice was 3200 pounds an acre. In estimating the cost of producing rice, however, the government estimators have taken as a basis a yield of 3500 pounds. On this basis the average cost per acre is placed at \$36.25.

To secure good results water must be applied continuously and at a uni-

form depth for many days. The land therefore should be level and underlain by an impervious subsoil. Level land is less expensive to prepare for irrigation and the cost of maintenance is also less because fewer levees are needed.

Good drainage is as essential as abundant irrigation; otherwise the ground cannot be put quickly into condition for harvesting and the result is loss of grain.

It is therefore as necessary to provide for the removal as for the supplying of the water—a fact which is frequently overlooked. The solution of the problem is to be found in community cooperation in the creation of drainage districts and careful attention to the drainage ditches after they have been constructed. Where the drainage is insufficient the ground becomes waterlogged and there is a harmful accumulation of alkali.

Waterbure is the variety of rice grown for the most part in California at present and will probably continue to be so for some time. It is late in maturing and the seed should therefore never be sown after May 1. April 1 is perhaps the safest date to recommend for sowing in California. On black adobe soil 90 pounds of seed to the acre will be sufficient, but if the ground is weedy the quantity should be greatly increased.

In order to secure germination irrigation is necessary in the majority

of cases, but the water should not be allowed to remain in the fields longer than one or two days after each irrigation. On the other hand, the soil should never be allowed to dry out. After the plants come up experiments indicate that the fields should be submerged to a depth of from five to six inches for approximately thirty days. The amount of water required for this irrigation will depend largely upon the excellence of the construction of the outside levees and upon the care bestowed upon its application. In the experiments already conducted from 4.65 to 8 acre-feet have been used. The location of contour lines, the construction of the levees and the leveling should be done, it is estimated, for about \$9 an acre for permanent wide levees and for \$2.60 for temporary ones.

HIS GRATITUDE

A friend in a near-by suburb has a sign where the water comes through the wall of her house: "Water Your Horses Here." Many a teamster stops, glad for the spirit that invites him to use the privilege. This friend told us the other day that the driver of a coal team stopped and watered his horses. Then he sponged off their hot faces and shoulders. While doing this one of the horses reached out and licked his face. It seemed the only way he could show his appreciation.—F. H. R. in Our Dumb Animals.

"Every Day is Bargain Day" to the Man who Buys BUILDING MATERIAL from WHITING MEAD'S Big CATALOG! 1915 Edition is FREE to you—Saves 20% to 40%

\$50 Complete Bathroom Outfit for \$36.50

Consists of:
One Lavatory with Nickel Plated China Index Compression Basin Cocks, marked hot and cold, and Nickel Plated Adjustable P Trap and Rubber Stop.
One Heavy Cast Iron Porcelain Enamel Bath Tub, 5 ft. with 3-in. roll rim, including No. 4 1/2 Nickel Plated Fuller Bath Cock, offset supply pipes, connected waste and overflow, and slip joint nuts.
One High Tank, 6-gallon, Zinc-Lined Toilet Combination, complete with valve. Finished either in Natural or Golden Oak.
We guarantee this outfit in every respect—if you are not thoroughly satisfied with it, return it and we will refund your money.
This outfit was never before sold under \$50.00 retail, and is accompanied by our liberal money-back guarantee.
Shipping weight of outfit, complete, 500 lbs. First-class freight.

Shovels—At Wholesale Cost—Shovels

—You may go a life time before you get such an opportunity again. These shovels are in A-1 order but have been slightly smoked by means of a fire while in transit.
—Every one in perfect working condition, all styles and sizes; note the prices:
Long Handle, Round Point Shovels, per doz. \$4.85 or 50c each
Long Handle, Square Point Shovels, per doz. \$4.85 or 50c each
D Handle, Round Point Shovels, per doz. \$4.15 or 50c each
D Handle, Square Point Shovels, per doz. \$4.15 or 50c each
Long Handle Spades, per dozen \$3.75 or 40c each
D Handle Spades, per dozen \$3.75 or 40c each
D Handle Scoops, per dozen \$3.50 or 40c each

"Air Tight" Drum Heaters \$1.10 and \$1.25

—These splendid little heaters have never been equaled for giving quick, intense heat with a very little fuel.
—Burn wood, papers or coal with equally satisfactory results. Nothing better in a stove heater. Usually sold for much more but offered by us at \$1.10 and \$1.25.

\$15 to \$18 Front Doors \$10 Veneered Oak With Plate Glass

—A typical value from our Sash and Door Dept., finest quality veneered oak doors with plate glass panels at top. Secured by special purchases recently and not mentioned in our catalog. All standard sizes and styles. Write for further details.

"Standard" Roofing Paper

—A splendid quality of roofing paper that most firms would sell 20 to 40 per cent higher. Each roll complete with necessary cement, nails, etc., ready to lay.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

RURAL CREDITS

That there are many men of many minds is being amply shown by the hearings held in various parts of the state by the recently appointed rural credits commission. As has been announced in the Cultivator this commission consists of Col. Harris Weinstock, Dr. Elwood Mead, Dr. David P. Barrows, Mortimer Fleischacker and Senator Wm. E. Brown. Hearings have been held at Sacramento and Stockton, in Los Angeles and several sections of the Imperial Valley, and these hearings will be continued at other points in the state where there is sufficient interest. We venture that the interest will be intense and will keep the commission busy for some time to come. The investigation is following the line of the needs of this state for a better system of credits, especially for the rural classes, and in addition, as really a part of the greater question, information is being gathered as to land settlement or colonization on lands which may be purchased by the state and resold to settlers on exceedingly small payments at a low rate of interest, with a long term of years for completing sale, and as to marketing of farm produce. The commission drew a distinct line between rural credits and land colonization; the one is for the farmer now on his own land, or possibly for the tenant farmer who has the opportunity of farming if he can get proper equipment, while the land colonization plan has to do only with development of lands. The land colonization plan as carried out in Australia, and suggested as practicable for California, contemplated the purchase by the state of lands now idle or at least only partially productive, fitting these for

irrigation or for producing to their highest, with necessary equipment, on the payment or from one to five per cent of its valuation with quarterly or annual payments for a period of years. Rural credits contemplates the loaning to present owners of farm lands not to exceed 50 per cent of the value of the land and appurtenances for a period of 30 or more years on the amortization plan, the interest to be four or five or six per cent as may be necessary, the money to be advanced by the state from funds secured through sale of bonds for this purpose.

If it is deemed unwise to recommend state support then the question the commission is investigating is whether it is possible to secure the cooperation of farmers or of farmers and capitalists which will bring together a private fund sufficient to finance the farming interests. As a rule the feeling seemed to prevail at the hearings that this latter plan which is being worked most successfully in Germany would not be satisfactory in this country.

PATERNALISM

It is to be noted that the bankers of Southern California as a rule feel that disaster may follow a system of rural credits backed by the state to a greater extent than do the bankers of the northern end of the state. Several testifying before the commission in Los Angeles were emphatic in the belief that it would be disastrous or at least that such a plan smacked of paternalism or even of charity to one class of producers.

One witness before the commission expressed himself on this particular point, saying that he could not see why those who feared paternalism so much when it aided the producer to secure capital did not fear any ill effects from the paternalism of protective tariff. He could see no difference in the protection of an infant industry, which is believed in by the great majority of the people of the United States, and the protection and encouragement of the oldest industry which has been unjustly discriminated against.

The commissioners read extracts from hearings at Sacramento and Stockton at which some of the larger bankers expressed the belief that a wise system of rural credits would greatly increase the business of the banks. It would encourage better equipment and bring greater profit to the farmer, which would mean bigger deposits and greater prosperity to the banks of every section of the state. Hence they are working for the enactment of an amendment to the constitution which will permit the state legislature to pass a law which will increase the farmer's opportunities. Mr. Fleischacker of the commission is a banker interested in the larger commercial institutions of San Francisco and he is giving of his time to bring about rural credits.

One point made in this connection is that the banks are not as a rule seeking business in the field that rural credits would enter. Again the Southern California bankers saw possible danger in that politicians might secure jobs which should be filled only by financiers, and that a short time before an election officials who decided on the values of land would be tempted to loan far beyond real values in order to curry favor with those who are influential with the electorate.

In responding to this criticism Commissioner Weinstock called attention to the result of the plan in other countries and to the work in this country of the industrial accident insurance which has not only saved 25 per cent to the insurers, but in addition has accumulated a surplus which will give stability to state insurance. It was felt that this was one proof that state efficiency was fully as great as private. As one of the factors in state insurance the point was mentioned that every investment which is made

from its reserve fund must have the OK of a number of experts.

While no promise is made as to what safeguards will be thrown around rural credits it is to be presumed that the same careful consideration will be given to these points as has been given to the administration of the state insurance, and that no one man can play favorites, for to no one man is left entire discretion in handling the funds. Any one of the many may possibly be dishonest, but it is hardly to be presumed that all of them will be. Also any indication of favoritism to individuals may quickly be controlled through the referendum. In this connection it was announced that England had secured funds through sale of bonds to advance to Ireland in excess of \$3,000,000,000 through a period of many years and as yet not one penny had been lost. The system has been in effect in Australia for 20 years and not only has there been no loss to the state savings banks, which handle this matter, but they have accumulated a surplus.

If the buyer makes his payments for the first few years he is improving his security.

FARMERS NOT SUCCEEDING

In the northern hearings it was stated that in the last few years 90 per cent of the farmers have been unable to meet interest and principal and see nothing but ruin staring them in the face.

While on the richest land in California, probably the richest in the world, the so-called delta lands of the San Joaquin and Sacramento, 75 per cent of the lands are farmed by tenants and of the tenant farmers 75 per cent are Orientals, is there not a demand in the best interests of our state that these rich lands be placed in the hands of home makers and home owners who will mean far more to the prosperity of the state than the Oriental tenants?

True, it may be said that these lands are low and as at present handled not attractive to the best element of white farming, but these conditions may quickly be remedied once the state takes hold. The richest lands in all Europe are farmed by intelligent and well-to-do white people, and the conditions there as to altitude and healthfulness are no better, if as good, as those which can be secured in the delta lands of this state.

PRIVATE CAPITAL

Reference was made to large aggregations of private capital under the direction of mortgage guaranty companies, which operate by selling mortgages direct or using them as collateral. Such a concern has been organized in the city of Los Angeles with a capital of two and a half million, which proposes to loan money on ten and 20 years' time, the interest to be at the usual commercial rates. Many feel that concerns of this kind, together with savings banks, by making certain modifications in their regulations may meet the needs of the farmers and that it is unnecessary to use the credit of the state.

Replying to the question as to whether private capital had ever shown any desire to go to rural districts, bankers usually testified that in the past they had not; there were usually sufficient opportunities to loan money nearer home. The majority of the city money is used in the city; when there is a surplus, then the city banks begin to reach out to the country and the more remote districts.

MARKETING

It is true that greater production, which it is reasonably sure will be secured by rural credits, is not the crying need of California farmers so much as that a living price be secured for what is produced. This point was especially dwelt upon by those who are not friendly to the rural credits movement. Frequent reference was made to this year's conditions when the peaches already produced have not sold for enough to cover the cost of picking. Olives, apricots, alfalfa, nearly all products were referred to

as giving strength to this argument, and all agree that there is pressing need for action in the matter of marketing. And the commission seems to give as much attention to questions touching upon marketing as to rural credits. All told, it is a many sided question, and men with large minds are on this commission, and we believe it will evolve a scheme which will tend to make far more successful the farming operations of this state. But it and the legislature together will be powerless to act unless Amendment 17, Number 5 on the ballot is voted on favorably at the election which is to be held October 26.

Agricultural Notes

The Louisiana citrus crop this season is estimated at about 300,000 boxes. Mandarins form the bulk of the output.

The 1915 wheat crop of France this year is announced by the minister of agriculture as more than 1,000,000 tons less than in 1914.

An American chamber of commerce for Brazil has been organized at Rio de Janeiro to further the development of commerce between the United States and Brazil.

"The Culture of Rice in California" is the title of Farmers Bulletin No. 688 just issued by the bureau of plant industry of the United States department of agriculture. The text is mainly based on experimental work conducted at the rice field station at Biggs, Butte County.

On October 5-8 the sixth annual citrus seminar of Florida was held at Gainesville, Florida. The first day's program was devoted to fertilizers and grove management, the second to citrus canker, the third to other citrus diseases and pests. The last day was given exclusively to marketing.

The reason for the stronger tendencies and record buying of low-grade apples in the Pacific Northwest recently was made known in the fact that practically all the recent purchases were for shipment to Europe, states a Portland, Oregon, press report. Conservative estimates of the orders place the total at almost 500 carloads.

The fruit branch of the Dominion department of agriculture has now begun an educational advertising campaign to promote the consumption of peaches and other fruits in Canada. In this advertising matter the superior quality of Canadian fruits and the hygienic benefits of eating good fruit freely are emphasized. It is urged that fruit which can not be consumed at once should be canned or preserved. The advertisement says, "More fruit and less meat should be the rule this winter. It would mean better health and greater economy. * * * Eat plenty of Canadian fruit—lock the medicine chest and lose the key."

Rapidly augmenting prices of meat in Italy have caused a number of stock farmers' conferences to be held under the initiative of the national agrarian committee. To supply 2,000,000 troops it is estimated that in six months of war an additional 250,000 head of cattle would be necessary, or, in other words, Italy must provide for an increase in the number of cattle slaughtered of more than 40,000 head a month. Obviously, after subtracting the numbers needed for milch and draft animals, the cattle supply of Italy can not respond to these increased demands on it without outside help. There must be an importation of live cattle or an importation of preserved, canned, refrigerated, or frozen meat. Canada and Brazil are looked to as the chief sources for supplying the present need.

Next Tuesday Vote No. 5 "Yes" on the Ballot---"Rural Credits, Senate Constitutional Amendment 17"

Agricultural News Notes

of the Pacific Coast

Northern California

Esparto, Yolo County, observed October 9 as rice day.

Wine grape growers are generally selling at \$12 per ton.

Olive pickling plants at Oroville are busily preparing for the season's run.

The Santa Rosa Republican reports hop sales slow. Most of the sales made are at 12 cents.

The orange crop of Oroville, Butte County, is now estimated at about 75 per cent of last year's.

The boys' agricultural clubs of the state met at the university farm at Davis October 14 to 16.

There will be a poultry show in connection with the Marysville Rice Carnival to be held October 25-31.

The Butte County Orange League is still protesting against the standard of maturity fixed by the federal government.

The railroad commission has decided that the present freight rate on paddy rice must stand, that rice does not come under the grain rate.

Marysville, Yuba County, will hold its rice carnival the week of October 25 to 31. A comprehensive publicity campaign has been launched.

Northern California counties released from the sheep scabies quarantine are Butte, Yuba, Sacramento, Yolo, Solano, Contra Costa, Alameda and San Francisco.

Subscriptions are being solicited in the Eel River Valley to secure funds for gathering data on the Eel River irrigation project in order that the matter may be properly presented to congress.

Farmers who are members of the Humboldt County farm bureau are now securing lime at \$5.75 delivered. This matter is handled by the Humboldt County farm bureau business agent.

Thousands of acres of timber land in the Moraga Valley in Alameda and Contra Costa Counties was destroyed by fire the first of the month. The blaze was supposed to have started from a camp fire.

The California Creamery Operator's Association will convene at the Panama-Pacific exposition for three days, beginning October 29. One of the features of the convention will be the butter-scoring contest.

Orange men of Butte County, who are protesting against the maturity test for oranges imposed by the federal government, are discussing the advisability of sending a representative to Washington to state their case.

At the last monthly meeting of the Humboldt County Dairymen's Association at Ferndale it was decided to invite the California Creamery Operators' Association to hold its annual convention in the fall of 1916 at Ferndale.

Figures now available show that the total hop production in the Sacramento Valley Counties is approximately 67,231 bales. This is about eight per cent short of the total yield in 1914. Sacramento County is the heaviest producer, her yield being practically half the output of the valley.

Central California

The peach growers' organization is still campaigning for new members.

A new packing house has just been completed at Lindsay, Tulare County.

Lemon Cove, Tulare County, has shipped out about 600 carloads of oranges.

Reports from Fresno indicate that between 800 and 900 cars of grapes remain yet to be shipped.

There is talk of forming a cow testing association in Stanislaus County under direction of the farm bureau.

A larger campaign than ever is being planned by the organizers of the California Peach Growers' Company.

Peach growers of Oleander, Fresno County, have already subscribed \$1280 toward the Peach Growers' Association.

The West Coast Potato Association met at Stockton Saturday, October 2. The attendance was disappointingly small.

The annual meeting of the Kern County farm bureau will be held on November 27 at the county high school.

Raisins are in good shape in the vineyards around Hanford. The packing houses are rushed with the incoming fruit.

The delivery of raisins to the California Associated Raisin Company is very heavy. It is now averaging 1000 tons per day.

The Watsonville Apple Distributors have taken up the question of the advisability of securing a farm adviser for Monterey County.

The Tulare County Growers' Protective Association has unanimously decided to maintain the government standard for maturity of oranges.

J. L. Taylor of Three Rivers, Tulare County, is in San Francisco attending the exposition. Mr. Taylor has been a subscriber of the Cultivator for 15 years.

The state railroad commission has requested shippers to load and unload freight cars with the utmost expedition in order that car shortage may be avoided.

Modesto alfalfa fields are still being "barbered." Modesto's slogan, "Water, Wealth, Contentment, Health," might be made to read "Soil, Water, Alfalfa, Cows, Fat Bank Accounts."

The country "seen from the car windows" between Hanford and Sacramento looks prosperous. The fine dry fall weather is appreciated by all workers of the soil and the crops are well in hand.

Lindsay orange growers are planning to exhibit at the National Orange Show at San Bernardino February 17-24, 1916. Lindsay this year carried off the sweepstakes at this show and the growers have no notion of taking second place next year.

A campaign against the red spider, which is working destruction to the prune crop of the Santa Clara Valley, has begun. It is under the supervision of H. H. Taylor of the state university. A liquid lime sulphur spray is to be used during the winter, followed by a sulphur spray in the summer.

Southern California

There will be a flower show in Los Angeles October 23-30.

Orange County's fair showed a splendid variety of exhibits.

Banning is to hold a flower show at a date soon to be announced.

More than 3000 sacks of sugar are being made daily at the Chino factory.

The famous 101 Ranch, south of Brawley, is to be subdivided into 40-acre plots.

The citrus fruit juice factory in Cucamonga is making a trial run on black grapes.

Orange County is holding its county fair at Santa Ana this week, from the 12th to the 16th.

An increase of nearly 1500 acres in new plantings of apricots is reported from the Hemet Valley.

California's ripening citrus crop is estimated at approximately 48,000 cars by the Santa Fe railroad.

Estimates by bean men of Orange County place their income from this year's crop at about a million and a half.

The first Antelope Valley Fair was held at Lancaster Friday and Saturday, October 8-9. There were many agricultural exhibits.

That fully 100,000 acres will be planted in cotton in the Imperial Valley next year is predicted by several valley growers.

Yuicapa's apple show will be held November 4, 5, 6. Growers of the Oakglens and Beaumont districts will exhibit their fruit.

The walnut crop for California this season is estimated at 12,500. The price on No. Ones has been fixed at 13.6 cents per pound.

The Ventura County Cured Fruit Association will soon distribute to its members \$26,000 as first payment on apricots delivered to the warehouse.

The counties' convention of the California Development Board will convene at San Diego November 12 and 13 to discuss better market methods.

The Hemet-San Jacinto Growers' Association is making arrangements to pack its own olives, although machinery cannot be installed to handle this year's pack.

The horticultural commissioner of Santa Barbara County reports lima bean yields in several sections at least 50 per cent higher than on the same fields last year.

A marketing expert of the United States department of commerce is stationed in El Centro to work with the Long Staple Cotton Growers' Association in marketing the Durango crop.

The Fairview Farms' Products' fair held on October 2 brought out a very satisfactory exhibit of farm products. The exhibits will be displayed at the Orange County fair being held in Santa Ana this week.

The Arlington Heights Citrus Exchange has passed a resolution deprecating the patenting of the Chase orange separator by a manufacturer. Mr. Chase perfected the separator and offered it freely for the use of all citrus growers.

The Coast

Owners of Angora goats in Arizona are just finishing their fall clip.

Bellingham, Washington, reports an apple crop only 50 per cent of normal.

Wheat buying for Eastern shipment is reported heavy again at Portland, Oregon.

Wenatchee, Washington, holds the palm for shipments of apples this season from the state.

Apple packing will be in full swing in the Spokane Valley of Washington until Christmas time.

Portland, Oregon, reports buying of wheat very slow but the farmers getting the prices they ask.

The Oregon agricultural college has installed an instructor in the use and care of farm machinery.

The Idaho state fair at Caldwell the last week of September had more live stock entries than any previous state fair.

To meet the increasing demand for an alfalfa meal mill four new mills have been built in Colorado and another four in Montana.

Twelve thousand sacks of wheat were disposed of in one sale at Pullman, Washington, recently. The price paid was about 70 cents.

The management of the Arizona state fair is now distributing official premium lists. The fair will be held at Phoenix, November 15-20.

The Seattle market last year received about 100,000 boxes of Japanese oranges. This year there seems to be little demand for the fruit.

The Oregon hop crop, it is estimated, will this year bring to growers more than \$2,000,000. The price has averaged only about ten cents per pound.

The Walla Walla Valley Cow Testing Association has been organized at Walla Walla, Washington. The state penitentiary has entered its cows for testing.

The Santa Fe Railway Company has contributed funds to the agricultural extension service of Arizona to help defray expenses of a farm adviser in Navajo and Apache Counties.

Apple grading rules of the Yakima Valley of Washington this year exclude worm-stung apples; the only disposition that can be made of this fruit is to the by-products plant.

The Arizona Wool Growers' Association, through its secretary, L. F. Verkamp, is making a vigorous fight against the order of the state tax commission raising the valuation of sheep from \$3.50 to \$4 per head.

Three hundred and fifty head of cattle were entered this year at the Utah state fair. This was the largest number of cattle ever exhibited at the state fair. The value of the live stock was estimated at from a half to three quarters of a million dollars.

The University of Arizona agricultural extension service announces that a special school of instruction for dairy farmers will be held in connection with the fourth annual farmers' short course at the college of agriculture January 3 to 15, inclusive.

Making a Silo Pay

is an easy matter if you have the right kind.

THE UNIVERSITY FARM at Davis, Calif., last year bought an

Ideal Green Feed Silo

and tried it out in actual use beside others, including a home-made one they built.

THEY RECENTLY PURCHASED ANOTHER Ideal Green Feed Silo, which is the best evidence needed of their judgment of its quality and efficiency.

THESE TWO IDEAL GREEN FEED SILOS are used to help make a profit in their farm operations and were purchased out of their farm income.

THE MEN IN CHARGE ARE BUSINESS MEN and know a good thing when they see it.

WHY NOT PROFIT BY THEIR EXPERIENCE and order your Ideal Green Feed Silo now?

BIG CORN CROP IN THE SACRAMENTO VALLEY

Written for The California Cultivator
By Sacramento Valley Contributor.

THE biggest corn crop ever grown in the Sacramento valley is being harvested. The continual subdivision of large acreages, the constant increase in the number of intensively cultivated farms, the greater use of irrigation water, and a realization that more live stock and more stock feed are required for the best agricultural development of the section; are some of the reasons for the planting of more corn.

Many kinds and varieties have been planted, including a number of the sorghums. Among these are brown and white Egyptian corn, milo, feterita, Egyptian wheat, white and yellow dent Indian corn, pop corn and sweet corn.

Corn has been planted on all kinds of soil, from the sandy loams in the river bottoms to the heavy clay and adobe types on the plains and in the foothills, and it has been planted both with and without irrigation.

The yields will vary from 50 to 60 sacks per acre down to nothing. Moisture, rather than fertility, is the limiting factor, although the cultivation required to conserve moisture undoubtedly renders fertility more readily available. Practically all Sacramento valley soils are rich enough to produce big crops of corn if they are properly worked at the right time to make a good seed bed and a sufficient supply of moisture is available.

There are many low yields where the soil was plowed shallow and the crop not cultivated after planting. In many cases, the land was plowed once, harrowed once or twice, the corn planted—and "that's all." The winds evaporated most of the moisture from the soil either before or shortly after the crop was planted, leaving sufficient for only a very small growth of stalk with few, if any, heads.

Along the Sacramento river there are fields that are plowed early in the spring, then replowed and disked and harrowed many times, sometimes eight or ten, during April and May, and the corn planted late in May or early in June. The moisture is held by the mulch created by this cultivating, and all of the weed seeds in the soil are germinated and the weed plants killed before the corn crop is planted. These fields make heavy yields every year, and the varieties grown are generally brown or white Egyptian corn or milo.

Where irrigation is available large crops of Egyptian corn and similar crops are grown as a second crop. Barley or wheat sown in the fall is harvested for hay in May, the land thoroughly irrigated, a seed bed made and corn planted late in May or in June. It is sometimes planted in July and a good crop matured.

The best Indian corn is generally that planted quite early, in April or early in May at the latest. One of the most successful growers of Indian corn in the valley is W. G. Stimmel, superintendent of the Vina Ranch of Stanford University, and he insists

that very early planting is one of the essentials in successful Indian corn growing.

There is opportunity for a far greater increase in the corn acreage of California and with it an increase in the number of animals fed and fattened.

NEW AGRICULTURAL DIRECTOR

Mr. E. B. Balis has succeeded to the position of manager of the agricultural department of the Whittier state school, made vacant by the resignation in August of Mr. W. H. Taylor, who assumed general conduct of the large stock farm of Mrs. Anita Baldwin.

Mr. Balis brings some experience to this work which gives him rather peculiar fitness for the work assigned to him. His boyhood was spent on his father's ranches, which numbered thousands of acres. After a course at the University of California college of agriculture, he acted for the university for a year and a half in testing cows for the advanced registry of the Holstein Friesian Association of America. In the course of this work Mr. Balis has come into direct contact with the breeders and owners of nearly all the purebred Holstein Friesian cattle in this state; and not only the owners and breeders, but the individual animals themselves, have come under his close scrutiny. Thus he is in a position to know accurately the value of different strains now present in the state and can readily decide what individuals in the school herd to retain as promising and what to discard.

It is the intention of the trustees and Superintendent Nelles to bring the herd still more into prominence as one of the strongest herds in the state. This will be done by reserving only cows which have been successful in passing the A. R. O. tests. These tests have been conducted by Mr. Balis during nearly a year, and at this time there is not a single animal in the herd which is not purebred and registered. This, however, is not enough; and within perhaps another 12 months we may see a herd without one member who has not made her A. R. O. standing.

Mr. Balis will by no means confine his attention to the herd, which with the purebred Berkshire hogs will be under the care of two experienced stock men, assisted by a crew of boys. The other features of the farm will receive equal care. Just now walnut picking is about to commence; the Johnson grass is being attacked with persistent vigor; new pipe lines are being laid; and the entire farm, including the floral department and the vegetable garden, is looking up.

The presence of a university man who is also a practical farmer of years of experience in California, is expected to place the school farm still higher as a money maker than it has shown itself to be during the past few years.

NO REDUCTION IN FEE

Secretary Gow of the American Jersey Cattle Club writes that "on the 9th of July last a proposition to reduce the membership fee to \$50 was submitted for a vote by mail of the club members, as provided for in the con-

stitution for its amendment. The result is as follows: Votes against the reduction of fee, 219; votes in favor of reduction of fee, 145; number of members not voting, 190. A change in the constitution requires the written consent of three-fourths of the members of the club voting. As only 145 of the 364 who voted favor the amendment, it has not been adopted, and the club membership fee remains at \$100."

HOGS AND LICE

Written for the California Cultivator
By W. S. Guilford

If every raiser of hogs would make a little investigation of his business and try to determine what per cent of the feed his hogs consume was used to make hog and what part went to the lice and ticks living on the blood of his animals, there would be a tremendous increase in the sale of Kreso and other dips and of crude oil for use around hog lots.

It is doubtful if any one would arrive at anything very definite in the way of percentages, but hundreds of growers would see enough to make them wonder why they had not made the "lice and ticks cleanup" before.

In this country the lice and tick problem is a continuous one. Infestation is apparently everywhere and constant warfare must be waged. This does not mean that the job is a hopeless one or even a very expensive proposition. It is rather a matter of careful attention and keeping everlastingly at it. If there is a dipping vat the hogs should be run through it frequently. If the hogs are to be put in a close pen and sprayed this must be attended to with regularity, and oil and disinfectant must be used in pens and sleeping quarters and on rubbing posts constantly.

DANISH EXPERIENCE WITH FOOT AND MOUTH DISEASE

The Danish outbreak started at about the same time the disease was discovered in this country; it was handled by the isolation, or quarantine, method; the disease has apparently been more virulent in that country and the present status of the disease is not as encouraging in Denmark as it is in the United States.

From the statements made it would appear that Dr. Melvin and the Bureau of Animal Industry are upheld in their contention as to the losses which may be anticipated as a result of this plague and that our present experience in this country is not sufficient to form the basis of a final judgment. Perhaps the United States may have to come to the isolation policy and accept the disease as indigenous to the country, yet Denmark's experience warns us that the wisest policy for us to follow, at the present time, is to slaughter and bury the contagion. Their experience shows how difficult it is to control the disease by quarantine. It should be noted also that after nine or ten months trying to stop the spread of the disease there are still 63 fresh outbreaks weekly. While we have not been able to stamp out the disease entirely, yet we have it under control and no one fears a general outbreak again.

Further, the farmers in Denmark, or where the isolation system is followed bear the entire expense of the disease, but in this country, where the slaughtering system is followed, every taxpayer helps share the loss.

It is the desire of all that the foot and mouth disease be stamped out in this country, but there are varying opinions as to the best method of ac-

completing this. Those who have felt that the government has been wrong in slaughtering cattle and hogs affected with foot and mouth disease should read carefully Dr. Bang's statements and reflect upon what the disease is costing the farmers in Denmark and also upon the final results. —Hoard's Dairyman.

CARE OF THE WORK HORSE

Horses at work on the farm should be given the best of care, and the work should not be too severe or continued for too long time without giving the horse a rest and change of diet. Collars should be examined frequently to see that they conform to changes in the size of the neck as fat changes to muscles, and the hames should be kept perfectly adjusted to the collar. The mane should be kept from under the collar and the shoulders should be washed at meal times, preferably with a little salt in the water. Oats is the standard grain where available, and mixed clover and timothy is one of the best hays. A little hay may be given at noon, all the animals will eat up cleanly over night, and none in the morning. Water should be given three times a day before feeding, and it should be clean enough for the owner to drink.—O. A. C. Bulletin.

SILO SEALING SUGGESTIONS

There is always some loss on the top of the silage unless feeding is begun as soon as the silo is filled. Where the silage is to stand for some time before feeding, it is customary to run in three or four loads of cornstalks from which the ears have been removed. This material is packed thoroughly; then a liberal supply of water is added which will help to seal the silo and only a very small amount of waste will result. Some farmers use oat straw as a covering; others soak the top of the silage with water and sow oats which, when they germinate, form a dense mass which shuts out the air and keeps the silage from spoiling.—J. G. Watson, Missouri College of Agriculture.

COST OF SILO FILLING

No definite cost can be given for silo filling, as it depends on many variable factors, such as the distance from field to silo; weather conditions, it being more expensive during wet weather than clear weather; the efficiency of the machinery and of the men. The cost has been estimated as low as 40 cents, and as high as \$1 per ton. Seventy-five cents would probably be a fair average.—Agricultural Experiment Station, Columbia, Mo.

CATTLE PAPER

One of the hardest problems livestock growers and feeders have had to solve is that of obtaining money at a reasonable rate for a reasonable length of time. To the uninitiated this may look like a simple problem in arithmetic, but many a stockman knows from bitter experience that a high rate of interest piles up a big item on the cost side of the ledger. He knows that many a profit has gone glimmering because a banker would not allow an extension of time sufficient to put the proper finish on the cattle or hogs.

What is needed is a thorough understanding between bankers and farmers. The farmers' feed yards should be as familiar to the country banker as the bank is to the farmer. Better understanding will result in more just treatment of the individual.—Country Gentleman.

HOG CHOLERA

Farmers themselves can do much toward preventing the spread of hog cholera, thus placing swine raising and feeding on a firmer and more profitable basis. To this end the following suggestions are offered:

To Keep Hog Cholera From Reaching Your Herd

Locate your hog lots and pastures away from streams and public highways, and do not allow the hogs to run free on range or permit access to canals or irrigation ditches.

Do not visit your neighbor or allow him to visit you, if either of you have hog cholera on your premises.

Do not drive into hog lots when returning from market or after driving on public highways.

Do not use hog lots for yarding wagons and farm implements.

Do not place newly purchased stock, stock secured or loaned for breeding purposes, or stock exhibited at county fairs, with your herd. Keep such stock quarantined by keeping them in separate pens for at least two weeks, and use care to prevent carrying infection from these to other pens in feeding and attending stock.

Burn to ashes or cover with quicklime and bury under four feet of earth all dead animals and the viscera removed from animals at butchering time because they attract the attention of buzzards, dogs, etc., which are liable to carry hog cholera infection.

Confine your dogs and do not keep pigeons unless you confine them.

It is preferable to secure the water supply from wells.

If Hog Cholera Appears in Your Herd

Treat your hogs immediately with anti-hog-cholera serum, after which they should be kept on a light diet and pure drinking water, and confined to limited quarters that may be cleaned daily and sprayed three times a week with one part of compound cresol solution to thirty parts of water, until the disease is abated in the herd.

To Rid Premises of Infection

Remove all manure and saturate with quicklime.

Burn all litter, rubbish and old hog troughs.

After the premises are thoroughly cleaned, spray walls, floors and other surfaces with disinfectant, one part compound cresol solution to 30 parts water. Where hog houses are small turn them over, exposing interior to sunlight.

Wallow holes and cesspools should be filled in, drained, or fenced off.

All runs underneath buildings should be cleaned and disinfected and then boarded up to keep hogs out.

Destroy hogs that do not fully recover, as they may be carriers of cholera infection.

For information regarding hog cholera see your farm adviser or address Dr. B. J. Cady, United States Veterinary Field Agent, Agricultural Experiment Station, Berkeley, California.

SILAGE GOOD AT ONCE

"Save waste by feeding silage as soon as the silo is filled if you want to," says J. G. Watson, of the Missouri College of Agriculture. "It is not silage, but only green corn, finely cut, until heating and fermentation have proceeded for a few days, but the animals like it. Such early feeding makes use of a top layer that is usually allowed to spoil. If it is allowed to rot, put it where no farm animals can reach it or trouble may result."

Milk begins to sour within a few minutes after it is taken from the cow if it is not cooled. The bacteria that cause souring do not thrive in cold milk. Therefore, to keep your milk or cream sweet, cool it without delay.

Veterinary Queries

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit \$1.00. In writing questions give full symptoms or particulars of injury of animal.

Vaccinating for Black Leg

Last winter I lost some calves with black leg. I have vaccinated my young calves this summer. Is it necessary to vaccinate them again?—Subscriber, Yermo.

Vaccinating against black leg is said to last from six months to one year in young calves. It will be safest to vaccinate again just before the time you had the outbreak last year.

Cancer

What, in your opinion, is the trouble with a cow with a sort that started with a swelling under the left eye and from that there seem to be raw looking little growths something like warts that appear wherever it is open? At present there are three of these growths in the large swelling and one in the corner of the eye on the eyeball, and the eyeball is losing its natural color and is turning greenish. The cow seems to be in good condition otherwise and in good flesh. Would you consider the milk good for family use? What can be done for the cow?—Subscriber, Alpaugh.

It is probably a cancer and incurable. Do not know whether it would affect the milk or not but think not. If it has not gone too far it would not affect the parts used for meat.

Bony Tumor

I have a seven-months-old colt that has a sore under its jaw where the halter strap goes, the size of a quarter. There is a scab on it that matters some. When I feel of it there seems to be a lump two inches in diameter on the bone. It does not seem to hurt the colt and is not very noticeable.

What shall I do for it?—Subscriber, Orland.

It may be due to irritation from a tight halter, an injury or an ulcerating tooth. Change the halter so it will not touch the parts and rub on a good

Several Imperial Valley ranchers have made test plantings of rice this year.

liniment once a day. If it grows larger it is probably due to an ulcerating tooth and that will require the services of a veterinarian. If it is only due to irritation from the halter it will soon disappear.

Tuberculosis

I have a Holstein heifer with first calf that has recently developed a very hard lump on her throat. It is about the size of a large orange and is extremely hard to the touch. She does not seem to be affected by it either in appetite or milk production. Can you state what it may be and suggest a remedy?—Subscriber, Anaheim.

Probably it is a tubercular abscess. First have her tested for tuberculosis by a good veterinarian. If there is reaction he will advise you what to do with her. If there is no reaction then have the tumor removed by dissecting it out. The veterinarian who does it will give you a lotion to heal the wound.

THE GREAT CATTLE SHOW

Continued from Page 393

dividuals of the beautiful and refined "Island" type and others that have been bred with butter production as the first requirement and finish and trueness to this type second. The Jersey show alone is worth coming a long way to see.

Guernseys

There is a big show of Guernsey cattle, an exhibit that is an indication of the growing popularity of this breed on the Coast. There are cows in the show that have made big official records and others that have been winners of important prizes not only in this country but in the Island of Guernsey. Much time can be profitably spent in the study of dairy perfection and quality among the Guernsey herds.

Many California breeders are represented.

W. H. Saylor, editor of the Pacific Dairy Review, San Francisco, and a great dairy authority, has a splendid exhibit from his famous herd, and attention is called to the great bull at the head of his herd and his get. It is a great lesson in the value of a high class sire.

W. H. Dupee of San Diego has maintained a herd of excellent animals on display at the exposition in the interests of the breed for some time; these are now entered in the show.

The Lathrop herd from Palo Alto, which has been exhibited for years at the state fair is here, as are splendid representatives of A. B. Humphrey's herd at Mayhews.

The Northwest is represented by D. H. Looney of Jefferson, Oregon; A. L. Gile of Chinook, Washington, and the Oregon Agricultural College at Corvallis.

The university farm at Davis has a few good Guernseys in the show, and there are representatives from the herds of J. Smith and Dr. J. H. Henderson of Berkeley and L. H. Albertson of Santa Clara.

Secretary W. H. Caldwell of the American Guernsey Cattle Club is in attendance, and the cattle are being judged by Chas. L. Hill of Rosendale, Wisconsin, one of the great constructive breeders of dairy cattle of the world and the foremost Guernsey authority in America. Those who have an opportunity to follow his work will be particularly fortunate.

Holsteins

In point of numbers the show of Holsteins is not representative of the strength of this breed in California and on the Pacific Coast, but there are many individuals of superior quality on exhibit.

The herd of the Carnation Stock Farms, Seattle, Washington, is installed in the beautifully decorated barn in which the Shire horses of the Blackhawk Stock Farm, San Mateo, have been stabled all summer.

The Panama-Pacific Dairy Company, of Sutter Creek, has a nice display, and the Pacific Northwest is well represented by Wm. Bishop, Chimacum, Washington, and J. L. Smith of Spokane, Washington. Holsteins are being judged by W. H. Standish, Lyons, Ohio.

Ayrshires

One of the attractions of the show is the exhibit of Ayrshires. Over 100 head of this hardy Scotch dairy breed are being shown by W. J. Domes, Crescent Hill Farm, McCoy, Oregon; E. B. McFarland, San Mateo; J. W. Clise, Seattle, and the Oregon Agricultural College, Corvallis. Hugh Van Pelt, Waterloo, Iowa, is placing the awards.

"Why do you breed Ayrshires?" was asked Mr. Domes, and he replied: "They are the best rustlers I know of and will stand more grief in our cold, raw, rainy winter weather in the Willamette Valley. And that they are proving popular in the hill lands of California is shown by my sales here. In January of this year I sent 14 bulls to California and from my herd of about 100 breeding animals I have sold 68 this year."

Dutch Belted—Swiss—Red Polled

There is a big show of Dutch Belted cattle from the Strader herd at Ceres.

One herd of Brown Swiss is represented, that of B. P. Inman, Junction City, Oregon.

There are two good herds of Red Polled cattle on exhibition, those of R. R. Cartwright, Angels Camp, Calaveras County, and F. J. Porter, Halsey, Oregon. Secretary Harley A. Martin, Gotham, Wisconsin, of the Red Polled Cattle Club, is in attendance and the judging is being done by Elliot Davis, Lincoln, Nebraska.

Beef Cattle

It is a great disappointment that more beef cattle are not shown. There is a big future in California for the producer of high class beef, and a big show would have been of benefit and a source of encouragement.

Shorthorns

Had it not been for the quarantine over 300 Shorthorns would have been shown. There are only about 50 here now.

The Hopland Stock Farm of Hopland has a big show of good individuals in charge of Wm. Sim, a very capable feeder and fitter. The Allen Cattle Company of Colorado Springs, Colorado, is represented by a good show, and bears the distinction of being the "farthest East" herd on exhibit. There are a few animals in the Shorthorn herd from Nebraska and Oklahoma but no full herds are here from east of Colorado.

A. Chalmers of Forest Grove, Oregon, has a herd of dairy Shorthorns. On a big banner he announces that he requires no nurse cows to assist in the raising of the calves from his cows and that they are Shorthorns, not Durhams or Shorthorn Durhams or Bull Durhams.

The judging is being done by Captain Robson of Canada, and the American Shorthorn Breeders' Association is represented by Secretary Frank Harding. This is one of the strongest breed organizations in the world, and is doing splendid work in the interests of both new and old breeders. Representatives will advise with any who wish to buy registered Shorthorns and assist them in buying what they want. This service is free. Secretary Harding has just returned from a trip to South America. We need more good Shorthorns on the Pacific Coast.

Herefords—Aberdeen—Angus

Hereford cattle are shown by the Kern County Land and Cattle Company of Bakersfield and Geo. Chandler, Baker, Oregon.

Some of the best beef animals in the show are the Herefords and Aberdeen-Angus shown by the Davis Farm of the University of California. Great credit is due to Prof. G. H. True, Prof. J. I. Thompson and others of the animal husbandry department for the breeding, selection and finishing of these superior animals, and the state is fortunate in having the live stock affairs of its great educational institution in charge of such capable and efficient men. The Davis farm steers are among the sensations of the show.

LARROWE'S DRIED BEET PULP

It is no longer necessary to buy high priced mill feeds for your dairy cows. A ration composed solely of ALFALFA AND LARROWE'S DRIED BEET PULP furnishes just the right proportions of protein and carbohydrates, together with sufficient bulk and an abundance of succulence. Dairy cows will do their best on this ration and yield 1 to 5 lbs. more milk per cow a day shortly after putting them on it.

A. W. Morris & Sons (breeders of the world's champion cow—Tilly Alcartra) say "Larrowe's Dried Beet Pulp increases the milk flow, strengthens and improves the physical condition of the cow."

McAllister & Son (well known and very successful Holstein-Friesian breeders) feed alfalfa and Larrowe's Dried Beet Pulp exclusively and say that they "know of no grain its equal and couldn't get along without dried beet pulp."

Thousands of feeders will tell you of the splendid results they are getting from this healthful, succulent vegetable feed. It is excellent for fattening; also for horses, hogs, sheep, etc.

—is clean, wholesome, appetizing; aids digestion; contains five times as much nutriment as silage, with as great or greater succulence—swelling to fully six times its original bulk when moistened. It is put up in convenient 100-lb. bags and may be had either plain or with molasses.

GO TO YOUR FEED DEALER TODAY and order a single 100 lb. sack of either the plain or molasses dried beet pulp. Ask for Larrowe's. Test it on one cow whose milk record you know—and watch results.

FREE! Our Booklet "Profitable Feeding."
—containing valuable information on feeds and feeding. Should be in the hands of every dairyman. Write for a copy—today.

Poultry for Profit

THAT ELUSIVE FALL EGG

Written for the California Cultivator
By Jean A. Koethen.

THE producer of fall eggs, it is now generally conceded, must be a pullet. An older hen may lay, and she may not, but you cannot say "must" to her. We have tried the experiment of hurrying the hens through their annual dressmaking in hopes of inducing them to shell out October and November eggs only to find that while it is easy to force the molt it is by no means so easy to force laying after the molt.

You can give a hen new feathers,
But you cannot make her lay.

With the pullet the case is precisely the opposite. Given proper breeding, well-timed hatching, and careful feeding and exercise, she simply must lay, that is all there is about it. A pullet that doesn't lay when she is "ripe" is an anomaly.

Breeding, hatching, feeding, it sounds as simple as A, B, C, and yet there is never a fall that the same old wail doesn't rise, "Pullets don't lay." If they do not, there is a reason somewhere, and every poultry keeper must find out for himself where the hitch is.

The other day a lady who has kept hens many years showed me a lot of Leghorn pullets. All but one had red combs, and most of them were laying. "What do you suppose is the matter with that one?" she asked, pointing to the combless one. "She is just the age of the others. Why doesn't she lay?" The pullet she pointed out was a plain runt, undersized, no comb development at all, one of those backward birds that are to be found in every flock. The only thing to do with them is to eat them, for a Leghorn pullet that at six months looks like a half-grown chicken will never be worth her salt. Just why this is, so is not so easily explained except by saying that the bird is lacking in vigor or she would have made a better growth. These immature pullets should be removed from the flock the first of October and fattened for market.

Selection Necessary

A neighbor who usually has a productive flock of Rhode Island Red pullets, though she does not breed them, complained last winter: "My pullets are not laying as they did last year. I bought my eggs from the same party, too." The explanation is obvious. Her pullets of the year before were hatched from eggs laid by bred-to-lay hens and fertilized by a male bird that was the son of a prolific layer. There was no reason, of course, why the hatching eggs of the following year should not have been laid and fertilized by the same sort of stock, but they evidently were not. Probably the selection of the breeding stock both years was a matter of chance, but in the one case the lot fell on the wrong birds, while in the other they happened to be good breeders. It costs some care and trouble to know just which are the best layers in a flock, and which males are

sons of these layers, but bands are cheap, and they may be had in several patterns and colors, so there is no reason for not knowing all you want to know about your flock. It is well to mark the pullets that lay earliest and the hens that molt latest. An averaging up of these two kinds of bands gives a pretty fair idea of which hens are the proper mothers for next year's flock, and a setting of eggs from the best one or two of those hatched under one hen and either toe-marked or kept by themselves till they are ready for bands, will provide the cockerels for next spring's breeders.

Pullets from stock that has not been bred to lay may lay at the proper age, but they will not lay as many eggs as the bred-to-lay pullets and will usually not lay so early.

Hatch Early

When must pullets be hatched to assure their laying by the first of November? There is a difference in breeds, though not so great a difference as we are sometimes led to believe. Leghorns often begin laying at five months and always by six, if they are properly bred. The heavy breeds are generally a little later, but many of them begin at five months or a little past. My Orpington pullets, hatched the fifteenth of February, began laying in August, and one or two of them ten days before they were six months old. I have had them lay even earlier, but this is not desirable.

In choosing the best time for hatching, the poultryman has to steer between the Scylla of fall immaturity and the Charbydis of fall molting. February is a splendid month for hatching the heavy breeds in California, but February pullets are more likely than not to molt in October and November. Mine have not dropped a feather yet, but I am holding my breath. If they do not molt, I shall lay it to their having roosted in trees all summer. They were never under a roof until they were placed in the laying house the first of October.

In March pullets the fall molt is believed to be induced either by too heavy feeding or by roosting in crowded or overheated quarters. This overheating helps to loosen the feathers, and then refeathering is a necessity. Experts are investigating this matter of the fall molt, and these are their findings so far. It is a question, however, which every poultry keeper can investigate for himself. Try letting your March pullets roost out of doors and see whether they molt or not. If you cannot provide trees, you can let more air into their houses. Pullets hatched after the middle of March rarely molt in the fall, and those hatched earlier should not.

April is believed by many to be the very best month for hatching Leghorns, but I doubt if it is as good a time in California as March. We have to consider the depressing heat of June and July, not everywhere, but in many districts, and the shortage of green feed where water is scarce. March chicks have a bracing natal month and unlimited green food, if they are on range, for three months. This gives them a start which later chicks often fail to get.

Feed Abundantly

The pullet that is to be brought to laying maturity at the right time must be well fed, not with forcing feeds, lest she lay before she has attained her growth, but with plenty of good grain and a mash not too rich in protein. My pullets this summer had a great deal of steamed rolled barley and mated well on it. This was usually given in the morning after steaming all night. Sometimes, instead of the barley, I gave the moist, warm mash in the morning more frequently. The composition of the mash was the same as that of the mash given to the molting hens, and differs from that of the laying pullets only in quantity of beef or fish scrap. The mash I am now feeding both pullets and hens consists of (by measure) 2 parts bran, 1 part ground oats, 1 part alfalfa meal, 1 part middlings, and about 1/2 part of fine beef scrap. The amount of beef scrap is varied according to the condition of the droppings. If they look like molasses I know I am using too much beef scrap and immediately cut down the amount. During the summer I used barley meal instead of ground oats.

A moist mash, rich in vegetables, does push the pullets along, and though it may be a little too forcing for us in the summer, is fine for fall. When once the pullets have begun to lay it may be given daily.

Green cut bone is one of the best of forcing feeds. I have found that my hens lay well without it, but I believe its use regularly twice a week would increase the egg yield considerably.

It is not necessary, I am sure, to remind those who are fortunate enough to have sour milk for their hens that there is nothing better. For some reason, the sour, clabbered milk is better than either sweet, skim or thin sour milk. It is better to use it for moistening the mash than to set it before the hens in a pen. When it is set out in this way, it soon becomes foul, the feathers of the hens are smeared, and, if any is spilled upon the ground it makes a breeding place for worms. Mix your dry mash with the clabbered milk, chop in a little lettuce or cabbage, and see how the hens sing and talk as they crowd around.

Exercise Develops Egg Organs

It is too late, when it is time for eggs, to begin to talk about exercise. The pullet that is to do her share in filling the November egg basket should have been exercising all through the months from the day she left the shell. She should have had free range as a baby chick, and all possible room as a growing pullet. The custom which prevails among many eastern breeders of farming out their chicks, that is, sending them to farms to be raised on free range, is one that cannot be too highly commended, and one that many California specialists would do well to follow. The pullet that is raised in confinement may prove a good layer this fall, but her daughters, if they, too, are raised in confinement, will deteriorate somewhat in vigor, and if new, range-raised blood is not introduced it is only a question of time till the whole flock is run-down and unprofitable.

It does not pay to sell thrifty, early pullets at any price as broilers if there is any place to keep them for fall and winter layers. This is a good time, however, to begin culling. Discard all that are not right up to the mark in vitality and size, keeping only those that show strong vigor and rapid growth. These are the ones that will develop into early layers.

VEGETINE

Makes
Bank Balances

We can save you from ten to twenty-five per cent on your feed bills. This means the difference between success and failure in the chicken business.

We have a wonderful new poultry food that contains more protein than Bran, which sells at a price thirty-five to fifty per cent cheaper than Bran. Write for circular "Food for Thought and Feed for Chickens," which tell all about this great money saver.

Mr. Kline of Burbank, Cal., one of the most successful poultrymen of Southern California, says:

"I have been using VEGETINE for the past four months on my whole flock and as far as I am able to determine at this time I am fully convinced that it is a saving in food price. We have gotten up to and above normal egg yield during the time at an appreciably lower cost."

Redwood, 1000, \$13; 2000, \$19.50; 3000, \$25; 4000, \$29; 5000, \$35; 10,000, nearly new, \$55. 25,000, with 20-ft. stand, \$75; 35,000, 40-ft. stand, \$190; 50,000 with stand, \$250. We manufacture new galvanized tanks—1000 gal., \$19.50; 2000, \$29.50; wagon tanks, irrigating pipe.

ENGINES—ENGINES
1½-h., \$29; 2-h. Fairbanks, \$39, or with jack, \$55; 3-h. R. & V., \$55; 6-h. Olds, \$68; 6-h. auto engine, \$25; 12-h. Stover, \$175; 11-h. White & Middleton, \$175; 28-h. Lambert, \$275; 50-h. Lambert, \$600.

PUMPS—PUMPS—PUMPS
2-inch hor., new, \$25; 3-inch, \$35; 4-inch, \$45; 2-stage, 5 hor., cost \$300, for \$125; 8-inch, \$90; 10-inch, \$90; 2½, new, \$35; 2-stage, \$35; 4, \$45; two 5-inch Krogh verticals, choice, \$48. 6 centrifugal pump with 45 ft. shaft, bearings, complete, \$90; 7-inch vertical Krogh, \$95. Two-stage verticals 3-inch and 5-inch. New, 6-inch rotary, \$50.

USED RANCH MACHINERY
Mowers, \$15 to \$25; mouldboard, disc riding plows, \$17 to \$29; hay rakes, \$15 to \$18; 6 gang disc for tractor, ½ price; beet seeder, \$29; \$160 Superior grain drill, \$75; 12 disc cultivator, \$19.50; \$40 clod crusher and roller, \$19; 3 gang 8-in. mouldboard plow, \$17.50; balers, headers, scrapers. Anything, everything ranchers need.

BOILERS, PIPE, FITTINGS, ETC.
Notice—Have every article we advertise or customer's name sold to. We do no fake advertising. Why not trade us what you don't want for what you need? If we haven't what you want, can find it for you quicker and cheaper than you can. We buy first-class used machinery, if price is right. No junk or stolen machinery wanted. DEMMITT, Co., 120 N. Main, Los Angeles. A5191, Bdwy. 3550.

For Sale—Used and new Gas Engines, 2 H. P. up, rebuilt and fitted with modern equipment. 22 years' experience enables us to repair and rebuild Gas Engines correctly. Get prices. Lloyd, 806-808 N. Main St., Los Angeles. F7020—Broadway 4103.

For Sale—Windmills, engines, tanks, pipe, horses, wagons, harness. We install your outfit. Will buy anything you have. Ranchers' Exchange, 1630 So. Main St., Los Angeles.

Machinery of Every Description Bought and Sold—Buttress & McClellan, 205-207 N. Los Angeles street, Los Angeles. Broadway 8098; A5473.

TREES

Chase Walnut Trees, grafted on black walnut root. First-class stock. They will make you money. Write for circular and price. Also seedling trees grown from the original CHASE tree. Magnolia Nursery, Whittier, Cal.

Choice Lot of One-year-old Apple Trees; first-class stock, 4 to 6 feet; \$5.00 per 100. Full line of nursery stock at equally low prices. Catalogue and price list on request. Wirt Nursery, R. F. D. No. 1, Portland, Oregon.

For Acacias, Avocados, Budded Loquats, Citrus trees, Evergreens, Feijoa, Palms, Roses and all kinds of trees, shrubs, vines, etc. Write for our new catalogue. Robertson Nurseries, Fullerton, Cal.

The "Chappelow" Avocado is the richest grown—over 29 per cent fat. Buys from the parent trees \$5 per 100 by mail or express prepaid. Address Wm. Chappelow, Route 1, Box 104, Monrovia, Calif.

Walnut Trees—Eureka and El Monte varieties a specialty; also Franquette and Placencia. Write for prices and description of stock. Personal inspection invited. Eureka Walnut Nursery, Montebello, Cal.

Extra Choice Avocado Trees. Seedlings and some fine budded stock for sale cheap. H. S. Miles, 314 So. First St., Alhambra, Cal.

Fig Trees. 25,000 two-year-old trees from 2 to 6 ft. high. Seventeen varieties. Write for price list. C. C. Terbush, R. F. D. 2, San Gabriel, Cal.

Nurserymen—Pot grown conifers, palms, shrubs and ferns for lining out or potting. Ballou's Nursery, Pasadena, Cal.

Citrus Nurseries, Murphy Oil Company, East Whittier, California. Selected stock for sale; inspection invited.

Budded Avocados—All varieties. Write for descriptive catalogue. Newbery Sherlock, R. F. D. No. 2, Pasadena, Cal.

SEEDS AND PLANTS

Strawberry Plants of the following varieties: Gold Dollar (extra early), fine, our leader.) New Oregon, "Morse", and the famous Ettersburgs No. 80, and No. 112, price 75c (postpaid) per 100, \$3.50 per 1000. Foreman Bros., Corning, Cal.

Burbank Spineless Cactus—Hardest varieties, "Melrose" and "Special." Strong, matured slabs, \$8.50 per 100; \$50 per 1000. Labranza Ranch, Athlone, Merced Co., Cal.

For Sale—First class re-cleaned alfalfa seed that has been inspected in the field by the Horticultural Commissioner, and is free from noxious weeds. Also choice Peruvian seed. O. C. Nordahl, Bard, Cal.

Fifty tons of choice white Egyptian corn for sale at \$30.00 per ton f. o. b. Lemoore, also a few tons of choice feather at same price. C. R. Flory, Lemoore, Cal.

Peruvian Alfalfa Seed—Hairy varieties, also Algerian wheat. S. P. Huss, Yuma, Arizona.

For Sale—Salway peach seed. M. N. Geller, Pomona, Cal. Phone 8456.

MISCELLANEOUS

"Smith's Pay the Freight"—To reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St., San Francisco.

LIVE STOCK

Big Type Poland Chinas—I have an extra good lot of strictly high class young boars from three months to one year old that are fit to head any herd anywhere. Visitors say they are the best they have seen. They have the large size, the good hams and shoulders, the strong arched backs, great length and depth of body, plenty of smoothness, mellowness and quality—in fact, they have two good ends and a good middle, are good lookers and money makers. Their dams are either from Illinois, Iowa or Missouri, or they are from dams whose sire or dam are from these states. These boars are sired by Iowa Wonder, who will weigh over 1000 pounds in show condition. He is a son of A WONDER, the greatest Poland China boar living or dead. These young boars carry the stamp of their sire and will sire pigs that will please you. Satisfaction guaranteed in every particular. I am overstocked. I have boars galore. I will sell them at extremely low bargain prices. No females for sale at present. The book on "THE HOG SUPREME—THE POLAND CHINA" will be sent to you free for the asking.

Yours for the BIG TYPE—the kind that grow faster and larger and have more pigs. Geo. A. Smith, Corcoran, Cal.

Billiken Herd—Pure bred, pedigreed O. I. C. Swine; the big white kind. Ready for immediate shipment; weaned pigs of both sexes; pairs and trios; mated not akin. All these pigs are from big type stock, of extra heavy bone; weight, with early maturing quality. Immunized against hog cholera; crated and registered free. Write for descriptive circular and price list. C. B. Cunningham, Mills, Sacramento County, California.

Del Dayo Farm (Old Haggin Bottom Ranch) Registered Berkshires, both sexes and from weanlings to one year old. Now ready a few choice Gilts safe in pig and some very choice 10 mos. old Boars and every sale absolutely guaranteed satisfaction. Stephen S. Day, Sacramento, Cal.

Grape Wild Farm Thoroughbreds—Guernsey Bulls of A. R. Breeding. BERKSHIRE HOGS. Finest herd in the state. All ages for sale. A. B. Humphrey, proprietor, Mayhews, Sacramento Co., California.

Cattle Instruments of every description at the right price to be had at O. J. Weber Co., manufacturers and importers of Machinery, Silos and Appliances for the Dairy and Creamery, 759 So. Los Angeles St., Los Angeles, Cal.

Thoroughbred Poland China Boars or large type for sale. Buy at home and save express. Prices reasonable. For further particulars write to Maywood Colony Nursery, Corning, Cal.

Blue Ribbon Herd Duroc-Jersey Hogs, Service Boars and Bred Gilts a specialty; also boar and two sows, not related. Meet me in S. F., 1915, prices. John P. Daggs, Modesto, California.

DUROC JERSEY BOARS
Trio of boar and sows not akin of the best blood lines at reasonable prices. Write me. L. L. DeYoung, Sheldon, Ia.

For Sale—At all times, Jacks and Stallions, driving and saddle horses. Price and stock guaranteed. Phillips and Kingsbury, 2318 G Street, Sacramento.

Milch Goats—Young Nubian Swiss does from heavy milking stock. For prices, etc., write Miss E. Stocker, 587 N. Broad St., San Luis Obispo, Cal.

Poland Chinas—200 head fine individuals, weanlings to eight months. Satisfaction or money refunded. Geo. V. Beckman, Lodi, Cal.

Berkshires—Pedigreed Boars ready for service. Bred sows, weanling pigs, both grade and thoroughbred, finest stock. C. H. Thompson, Navato, Cal.

Calves Raised Without Milk—Cost less than half as much as the milk raised calves. Write for free book to Coulson Co., Petaluma, Cal.

Registered Thoroughbred Berkshires of all ages; Cholera Immune; large boned. Ricconi Bros., Mountain View, Cal.

Poland Chinas—Young Stock; either sex. Write for pedigree. Reasonable prices. Edw. A. Hall, Watsonville, Cal.

Glenview Poland China—Stock for sale. Chas. R. Hanna, R. F. D. No. 3, Riverside, Cal.

Berkshires—Boar pigs for sale. Butte City Ranch, Butte City, Glenn Co., California.

N. H. Locke Co., Lockeford, Cal.—Choice young Jersey bulls for sale.

WANTED

Wanted—Experienced farmer to manage 82 acres alfalfa, hogs, garden truck, Whittier Boulevard, five miles Los Angeles; income \$10,000 to \$12,000 year; free irrigation water. Want man who will buy divided or undivided half interest; \$5000 cash, balance crops. Write owner Eugene Chilberg, Rivera, Cal.

Wanted—To hear from breeder of White Wyandottes who can supply fertile eggs in January. Bellows Bros., Lakeside, Cal.

Wanted to hear from owner of Farm or Fruit Ranch for sale. O. O. Mattson, Minneapolis, Minn.

Wanted—To hear direct from owner of good farm or unimproved land for sale. C. C. Buckingham, Houston, Texas.

DUCKS

For Sale—Thoroughbred Imperial White Pekin ducklings of all ages, and young breeders from first-class selected stock. Santa Cruz Pekin Duck Farm, Santa Cruz, Calif.

TURKEYS

Turkey Eggs for Hatching—Eggs from fine Mammoth Bronze Turkeys, guaranteed fertile. \$1.00 per dozen, also some fine young stock for sale, \$15.00 a trio. Address, John Hayes, R. F. D., Hynes, Calif.

Mammoth White Holland Turkeys—H. McKusick, Calexico, Calif.

POULTRY

Just Out—The Cultivator Poultry Book, "Poultry for Profit," by Jean A. Koethen. Published by the Cultivator Publishing Co. Highly endorsed by experts. Over 200 pages, 50 illustrations. Contains simple methods of avoiding and overcoming difficulties. A guide to poultry success under Western conditions—it tells what to do, why to do it, and how to do it. Nicely bound in cloth. Price \$1.00 postpaid, or with Cultivator one year, \$1.75. Send orders to Cultivator Publishing Co., 115-117 North Broadway, Los Angeles, Cal.

Baby Chicks, White Leghorns and Rhode Island Reds. Buy chicks of an expert incubator man. I am located at Gardena, a suburb of Los Angeles, among a number of large poultry ranchers who are making money selling eggs to the market. They have large, fine laying, healthy hens; I have no hens of my own, but buy my eggs for hatching from these ranches. I will guarantee the safe arrival by express of a full count, strong, vigorous, lively chicks properly hatched. J. W. Lyon, Gardena, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. National Poultry Co., 607 E. Third St., Los Angeles, Cal.

S. C. Rhode Island Reds, Lester Tompkins and Winslow strains eggs for hatching. Day old chicks. Prices on application. Raines Court Poultry Ranch, Zelzah, Calif.

White Leghorn Cockerels of highest utility breeding. Order early. Breeding from our Cockerels will increase vigor and egg yield. J. S. E. Blackshaw, M.D., San Jacinto, Calif.

First Class Chix—White, Brown Leghorns, R. I. Reds, B. P. Rocks, Buff Orpingtons for September and later. Stock guaranteed. Hawkeye Hatchery, Turlock, Cal.

Day-old Chicks—Barron Rocks, R. I. Reds, Lt. Brahmas, Buff and White Orpingtons, also breeding cockerels. Enoch Crews, Santa Cruz, Cal.

FARM LANDS FOR SALE

ALMOND LAND ALMOND LAND. FAMOUS ARBUCKLE ALMOND DISTRICT—20 acres of 6-year-old trees; orchard in first-class condition; located 1 mile from town; land adjoining it nearly all developed; price \$300 per acre, one-half cash and nothing to pay on the balance for 4 years, only the interest. The crops will more than pay out the balance. There is nothing wrong with this orchard only the price.

10 acres of 2-year-old almonds, 4½ miles from town. Located in the heart of a 3,000-acre subdivision, where there is 1,250 acres planted to almonds. A small, new house and a good well with gasoline engine and pump. Price \$1,700, \$1,000 cash, balance \$15 per mo. No interest or taxes on deferred payments. Write for literature on our subdivision.

NELSON REALTY CO., Pioneer Dealers in Almond Land, Arbutle, California.

Carlsbad Irrigated Farm Land—Bordering ocean; on state paved highway and Santa Fe Ry.; 80 miles south of Los Angeles; government records show Carlsbad warmest in winter, coolest in summer of any spot in Cal.; deep sandy loam, model water system; low rates; lemons mature in summer when price is highest; immense profits in fruits and berries adaptable to coast territory; winter vegetables without competition; minimum temperature 1914 was 41 degrees; tomatoes, chili, peas, beans, eggplant, rhubarb, etc., bring \$150 to \$400 per acre; easy purchase terms. South Coast Land Co., G. Buxton, Sales Agt., Carlsbad, Cal.

FARMERS WANTED

VICTORIA, AUSTRALIA, offers special inducements. Government land, water, railways, free schools, 31½ years to pay for farms adapted to alfalfa, corn, sugar beets, fruit, etc. Climate like California. Ample markets. Reduced passages for approved settlers. Free particulars from F. T. A. Fricke, Government Representative from Victoria, 687 Market St., San Francisco, Cal., Box X.

School Land Now For Sale—600,000 acres to select from. Lists, particulars, SCHOOL-LAND MAP, \$2.50. Also County Section Maps, showing GOVERNMENT LAND, \$2.50, any county. Order today. "Land Reporter," now, until 1917, \$2.50. Subscribe at once. JOSEPH CLARK, Sacramento.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

FOR LEASE

Fruit Ranch For Lease—High class apricot and grape ranch, located in the Imperial Valley, for rent on share basis to good man who can finance the labor needed. Produces the earliest apricots and grapes in the United States, so commands fancy prices. A high class proposition for an experienced fruit man with a little money. The American Nile Company, El Centro, Cal.

SCHOOLS AND COLLEGES

Wanted—About seventy-five young men and women to enter THE WESTERN NORMAL on August 30th, to prepare for teaching. Western Normal graduates secure and hold good positions. We assist graduates to secure good positions and promotion. We save you time and money. For information, address, WESTERN NORMAL, J. R. Humphreys, Principal, Stockton, Cal., 634 E. Main St.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade. The live stock and poultry industries are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

RABBITS

Caldwell's Royal Red New Zealanda scored and sold on merit. Catalog free. Caldwell Bros., Box 613R, Los Angeles.

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Acknowledgment of Contract

Is it necessary in an agreement of sale of property for it to be acknowledged before a notary?—Subscriber, Santa Barbara.

An agreement of sale is perfectly valid between the parties without being acknowledged; acknowledgment is only necessary to entitle the instrument to be recorded.

Workmen's Compensation

I own a small piece of land which I am improving for a home and on which I am raising a lemon grove. I wish to dig a well and build a house with basement. Some boulders must be blown up with dynamite and the granite in the well must be loosened with powder, also a carpenter might be injured by a fall. Would I be liable for damages in case of accident to any of the workmen, or being a rancher am I exempt?—Subscriber.

The workmen's compensation act excludes from its operation any person whose employment is casual and not in the usual course of the trade, business, profession or occupation of the employer. It also excludes any employee engaged in farm, dairy, agricultural, viticultural, or horticultural labor, stock or poultry raising or household domestic service, hence under both of these exclusions there will be no liability under the workmen's compensation act, but that does not mean that there is no liability for damages in the ordinary civil action, grounded upon negligence.

THE BURDEN

There is a story of an old man who toiled wearily along the dusty highway, with a cumbersome sack thrown over his shoulder. His face was wrinkled and seamed, and his voice, as he complained to every chance traveler of his burden, was querulous and unhappy.

An angel, passing by, stopped to listen to him.

"What do you carry in your sack, brother?" he asked kindly.

"My troubles," answered the old man.

"Let me look at them?" asked the angel.

The old man dropped his sack to the ground and, leaning over it, he painfully untied the cord which was bound around it. They both stooped over and looked in.

"Why!" said the angel, "there is nothing there!"

"That's queer," said the old man. "I had two burdens so heavy that I could scarcely stagger along under their weight."

"What were they?" asked the angel.

"One was a burden of yesterday," replied the old man. "I guess I must have dropped it awhile back, but I didn't know it until just now."

"And the other?" said the angel.

"That was a burden of tomorrow," explained the man. "I don't know what's become of it. I certainly thought it was there!"

"How about today's burdens?" asked the angel.

"Oh, I can always get along with what happens right at the time. Nothing has ever come to me that I could not endure for the moment. Well, I guess I might as well leave my sack here, seeing it is empty."

With a light step and a cheery whistle the old man went on his way. It was no longer dusty, but blossoming with flowers.—Grand Traverse Herald.

Questions and Answers

THE EDITOR

AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Cover Crop

Your article on cover crops in the September 30th issue interested me, particularly that part touching upon *Melilotus indica*, which I take to be the yellow clover. I have an orange grove and desire to try it, but I do not see how it can be plowed under much before a year after it is sown unless its habit of growth is different from that of the ordinary red clover. Would like to know whether it can be sown, say in November, or shortly after the crop has been picked, and will it grow fast enough to plow it under before the first irrigation is required? If this clover was permitted to grow for a whole season would it hamper the work of irrigation (we irrigate by furrows)? It would be almost impossible to draw the furrows while the clover was standing in the orchard.—Subscriber, Oroville.

Where the crop is picked as early as it is in Butte County perhaps it would be impossible to get *melilotus* thoroughly established before the tramping might injure the young plants. Certainly if planted this late that would be the case. For this year we would suggest the immediate planting of the *melilotus* in each alternate "middle" leaving the other section to drive in to gather the fruit, urging pickers to protect so far as possible the section where the *melilotus* is planted. Another year plant the entire orchard a month or six weeks earlier than this. After the cover crop is drilled in, or broadcasted as the case may be, then lay the furrows for irrigating before the seed starts. Then if a dry season comes the cover crop may still be encouraged by winter irrigation, also the ground is in condition for irrigating so as to aid in plowing under in case of no late spring rain. Unless there is an abundance of water for summer irrigation it would not be safe to try and carry the crop through the summer. To wait until after the crop is picked, even if it is shipped out in November, would be to secure almost no winter growth.

Laying Out Orchard

Please give information as to method of laying out walnut orchard.—Subscriber, Alhambra.

Some planters prefer 30 feet, far more 40, and a very few 50 feet apart, and trees set square. At 30 feet apart you will need 48 trees, 40 feet apart 27 trees, 50 feet 17 trees

Protecting Small Trees from Frost

Last spring I planted some orange, olive and fig trees for home use, and as they often freeze in the winter in this locality I would be pleased to have information how best to protect them, especially the orange trees.—Subscriber, Kingsburg.

The most common method of protection from frost for young citrus trees is through the use of cornstalks. Stalks having considerable foliage are set immediately around the trunk of

the tree and tied so that the top of the corn comes up and to a certain extent forms a funnel-shape around the top. The dirt is then raked around the bottom and packed so as to give additional protection. Of course in case of severe frost some of the tips may be frozen but this protects the trunk and the main part of the branches. Where only a very few trees are to be protected the setting over them of barrels or large boxes from which both ends have been removed is good. We have seen a barrel set over a citrus tree, the upper end of which came within a few inches of the top of the small tree projecting through the barrel and a severe frost took off almost the entire top on a level with the barrel. All within the barrel was protected and started nicely the coming spring. Four light stakes are sometimes set in the ground, each say about one by two inches, and high enough to come well above the trees, braced so as to support each other and covered with burlap. It is well to leave the top unprotected, or at least have covering that can be removed when there is no danger of freezing. Even where frost protection with orchard heaters is to be undertaken this precaution with young trees is advisable in exposed sections.

Rust on Snapdragons

One of our readers writes that she finds some kind of leaf rust on snapdragons that were sent from the East and wishes to know what to do for them as she fears some are dying.

There is no remedy possible whereby one may keep the plants and every plant is endangered by the presence of the disease. Pull up and burn at once all plants showing rust and watch the remainder and at the first sign of disease, destroy every infested plant, being careful to pick up every fallen leaf. This is a most serious trouble in many parts of the country, and only the greatest care and immediate destruction will stamp it out of the garden.

Black vs. White Hogs

Can you tell me why the preference in California, where there is practically eight months of warm weather, runs to black hogs or black with only a little white? Black is known to absorb the heat and one would naturally suppose that a white pig would stand the heat better. Can hogs be grown profitably without green alfalfa? Have only a ten-inch stream of water, which would not be sufficient for alfalfa but could grow such crops as corn or other green fodder.—G. L. Waring, Santa Monica.

We do not question but that our subscriber would be able to raise white hogs successfully in a section with a climate like Santa Monica, but in the warmer interior valleys greater care must be exercised to prevent blistering and various skin diseases. However, even in the warmer valleys there are some who maintain that the white hog has a great future. Whether there is a material reason why the black hog is more popular in

California than the white we cannot say. Sure it is there are many more blacks than whites. We are told the whites are, however increasing in number in this state. We think without question hogs may be profitably grown without alfalfa. However, in this state under proper conditions alfalfa can be produced cheaper than any other feed. The best way of handling the small stream on alfalfa would be by the use of a reservoir and then supply in larger heads.

Enlarged Crop

There are a number of persons in this district whose turkeys are suffering from a distention of the crop. A number of the birds die. The symptoms are a gradual enlargement of the crop until in many cases it touches the ground. We have opened some of the crops and there has been discharged therefrom a pint or more of liquid of a nauseating odor. This discharge relieves the bird for a time but in a few days the crop begins to fill again and becomes as bad as before.—Subscriber, Pond.

Enlarged or pendulous crop is due to irregular feeding or to overfilling or too slow emptying of the crop. Robinson says: "If a fowl is fed heavily, and from any cause, as indigestion, the crop remains full and distended too long, though this condition may in time be relieved in the natural way without interference of the keeper, the effect on the crop is the same as if the overloading had occurred because of irregular feeding. If this condition is repeated several times the walls of the crop become in some degree permanently distended." Turkeys, which are unable to digest the quantity of food chickens can take care of, seem especially susceptible to this trouble. This condition is sometimes relieved by

bandaging the crop with a firm, soft bandage, taking care that it is loose enough to allow a partial filling of the crop. If the crop hangs too low for bandaging the only remedy is an operation. Cut out of the enlarged portion of the crop a diamond or oval shaped piece of tissue about two inches long and one inch wide. Sew the edges together with white silk, making each stitch by itself and tying a knot that will not slip. The inner tissue and the outer skin should be sewed separately. Keep the bird by itself for a week, feeding soft food. Unless the birds are very valuable it would be better to market them than to attempt this operation. Salicylic acid, one grain to an ounce of water, is recommended for correcting the acidity of the contents of the crop. Salmon recommends two grains of subnitrate of bismuth and one half grain of baking soda in a teaspoon of water.—J. A. K.

Ticks on Dogs

What shall I do for ticks on dogs and cats? They are kept clean and given baths but the pests persist in remaining. Also, how can I keep fleas away?—Subscriber, Escondido.

Any pest as large as the tick should be picked off and dropped into the stove, then the kennel should be thoroughly treated with bichloride of mercury solution and the animals' bedding should be burned. As to fleas, lice and other mites insect powder is the safest to use around the animals' eyes and ears. Good fresh buhach will work if used persistently. Where fleas and lice have secured a foothold absolute cleanliness, or rather ridance, of all dust-laden places, with liberal use of the insect powder and the bichloride of mercury solution, or even of boiling water, works wonders. The use of carbolated vaseline is also effective.

The Oakley Paint and Varnish Factory with record for high-class material and fair dealing, can save you on any of your purchases of Paint Material. Write for Price List. Best Outside Paint \$1.60 in 5's.

Poultry Profitable

The new book, "Poultry for Profit," by Jean A. Koethen, gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. Through its guidance obstacles are overcome before it is too late.

PACIFIC POULTRY CRAFT SAYS:

A brand new book on poultry published by that old reliable Cultivator Publishing Co., Los Angeles. The author, Jean A. Koethen, has really written a poultry book worth while. The different subjects are treated with a directness that is refreshing, after reading so many books that say so much and mean so little. The book is intended for the beginner and farmer, but we commend it most heartily to anyone interested in poultry; whether for pleasure or profit; it is full of good things from cover to cover.

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe, at the price of one dollar post-paid.

\$1.00 Postpaid to any address.

\$1.75 with the California Cultivator, weekly, one year.

The Household Department

HAD I MY CHOICE

By Elsie V. H. Baldwin

Had I my choice these are the things I'd ask:

A little leisure for a well-loved task;
A quiet hill, where Space unfolds her wings
And winds are fresh and breathe of far-off things,
Where winter snows fall crisply on the sod,
White and unspoiled just as they come from God,
Where summer heat descends with life, not death,
Because untainted by the city's breath;
A little house, where friends may come and sit;
An open gate whereon this motto's writ:
"Good friend, behold beneath these trees
A gate that loves a guest;
Here he who walks may wait at ease
And he who runs may rest!"

THE HOUSEHOLD CONTEST

NO request comes to us more often than does the one that we ask for suggestions for school children's lunches. This is a subject that has been much discussed, but if our subscribers want more school lunches, more school lunches we will have.

Two dollars in cash will be given for best suggestions, \$1 for second best. All those published will entitle sender to three months' extension of subscription to the California Cultivator if such extension has not already been given this year. With suggestions send name and address of member of family now subscribing for the Cultivator that the three months' extension may be properly credited. Or it may, of course, start a new subscription.

All suggestions should be in this office by the morning of Thursday, November 18. Please use one side of paper only.

We are always open to suggestions for future contests.

Prize Winners

First prize, Mrs. M. L. Bernéike, Santa Ana; second prize, Mrs. D. D. Dettweiler, Alta Loma.

USE OF DRIED FRUITS

Written for California Cultivator
By M. Louise Bernéike, Santa Ana

Do not stew dried fruits. Save time, fuel and fruit flavor by the following method of preparation:

For fruits that have been sulphured, as peaches, apricots, apples and pears, wash thoroughly and let the last washing be on a sieve so that no particle of sand shall remain. Next cover the fruit with three or four times its own bulk of water, in which let it soak for at least 12 hours, or until it has reached the bulk which it had before drying. Now pour off and throw away the unabsorbed water and drain the fruit thoroughly on a colander, thus getting rid of most of the sulphur compounds and excess of acid. Meanwhile, prepare sufficient syrup of sugar and water to cover the fruit. Place the drained fruit in a dish and over it pour this bubbling, boiling hot syrup. Let stand till cold and it is ready for the table.

The amount of sugar used in the syrup must necessarily vary with the acidity of the fruit and the taste of the consumer. For apricots two parts of sugar to one of water is usually satisfactory. If a very rich syrup is used you will have preserves.

For making pies and puddings the drained fruit is used precisely as if it were fresh fruit. No stewing is necessary.

For such fruits as raisins and prunes, which have not been sulphured, it is not necessary to discard the water in which they have been soaked. It may preferably be used in preparing

the boiling syrup to pour over the fruit.

Walnut-Fruit Butter

Grind one teacup of walnut kernels fine and follow by one soda cracker. Mash one cup of pulp of dried fruit prepared as above for the table and mix thoroughly with the ground walnuts and cracker. If not sufficiently moist add a little of the syrup until the mixture has the consistency of jam. This is particularly fine when made of apples, raisins, figs or prunes. Sandwiches filled with this are fine for the school or picnic lunch. Fresh fruits may be used when in season, in which case sugar must be added to suit the taste.

DRIED FRUIT RECIPES

Dried Peach Butter

Stew dried peaches thoroughly, mash and put through sieve. Add one third as much sugar as fruit. Add spices to taste.—Mrs. C. W. Opple, Orosi.

Mock Cherry Pie

Where fresh fruits of all kinds are so plentiful and easily obtainable as in Southern California dried fruits are to some extent at a discount. There are many ways of using these, either alone or in combination, that give variety and add to the healthfulness of the diet. All dried fruits require soaking and very slow careful cooking. A little salt added while cooking serves to restore original flavor. Prunes may be soaked and cooked very slowly then sweetened slightly. To many tastes they are sufficiently sweet. Then add whipped cream and you have a fine dessert.

One cup cranberries, one cup sugar, half cup seeded raisins, chopped, a little water. Bake in deep pie pan.—Mrs. Geo. F. Herrick, Riverside.

Dried Peach Pie

Cook dried peaches until tender, chop fine, sweeten to taste, add a teaspoon of nutmeg to each pie. Bake with strips across top instead of upper crust.—Mrs. J. W. Brown, Goshen.

Dried Apple Cake

Soak two cups of dried apples overnight. Drain and chop fine and boil two hours in three cups of molasses. Let the mixture cool, then add two cups of seeded raisins, cloves, cinnamon and allspice to taste. Mix with cake batter made of one and a half cup brown sugar, one half cup of melted butter, four eggs, four and a half cups of flour, two and one half teaspoons of soda and bake.—Miss Mary J. Harvey, Santa Rosa.

Prune Whip

Stew 24 prunes until soft, let cool, mince very fine, beat the whites of six eggs until very dry, as you would for angel food; then add six tablespoons of powdered sugar. Now stir in very carefully the minced prunes. Bake 45 minutes in a pudding dish set in a pan of hot water. Serve with whipped cream.—Mrs. F. O. Roberts, Kerman.

Prune Whip

One third cup prunes, whites of five eggs, half cup sugar, half tablespoon lemon juice. Pick over and wash prunes, then soak several hours in cold water or until soft. Remove stones and rub prunes through a sieve. Add sugar and cook five minutes. The mixture should be of the consistency of marmalade. Beat the whites of eggs until stiff, add prune mixture gradually. When cool add lemon juice and pile lightly on a buttered pudding dish. Bake 20 minutes in a slow oven. Serve with boiled custard sauce or whipped cream.—Mrs. E. J. Pearson, El Centro.

Dried Apricots with Dumplings

Select about 30 halves of dried apricots, wash well and soak in cold

water. When soaked so as to look quite like the fresh fruit cover well with water and add sugar and cinnamon to suit taste. Put on to cook and when boiling well drop in dumplings made of one coffee cup of flour, one heaping teaspoon of baking powder, pinch of salt and enough milk to make thick enough to drop nicely from the spoon. Cover and boil about 20 minutes but be very careful they do not scorch. Serve warm with cream or a sauce made of whole milk, sugar and spice. This recipe will serve six people. A favorite with farm hands.—Mrs. B. B. Barnes, Laton.

Dried Peach Shortcake

Pour boiling water over one pound (or less) dried peaches; allow to stand a few minutes, then the skins will slip off easily. Boil peaches with one cup of sugar, and water to cover, until tender, then mash. They should not be too juicy. Make a rich biscuit dough. Roll out in two equal parts to fit an oblong dripping pan. Put in one layer (one-half inch thick) grease top, place second layer on first, bake. When ready to serve, remove shortcake from pan, lift off top layer, butter, spread peaches between layers and on top. Cut in squares and serve with whipped cream, plain sweet cream, or a sauce made as follows:

One and one half cups brown sugar, one tablespoon corn starch, add two cups boiling water, add one half teaspoon cinnamon, and a little allspice, cloves and nutmeg. Cook until slightly thick. This makes a very substantial dessert.—Mrs. O. H. Payne, Goshen.

Prune Shortcake

Remove pits from stewed prunes and mash smooth. Sweeten and flavor with allspice. Bake two layers of shortcake. When cool spread the prunes between the layers and on top. Top with frosting. Do not spread the prunes on until time to serve.—Mrs. B. W. Hays, Patterson.

California Raisin Pie

To one pound of seedless raisins add one half cup sugar and one pint water. Stew until done. Add strained juice of two lemons and two beaten eggs. Thicken with dry bread crumbs. Bake with one crust. When done cover with whipped cream or meringue.—Mrs. Clara Brons, Fresno.

Delicious Filled Cookies

Two cups sugar, one cup shortening, one cup milk, two eggs, seven cups flour, four level teaspoons baking powder. Flavor to taste. Roll thin, put a tablespoon of filling on one cookie, place another on top and lightly press edges together.

Filling: Two cups chopped raisins, two cups chopped walnuts, two cups sugar, four level tablespoons flour, two cups boiling water. Let come to a boil, add juice of a lemon, cool and spread.—Mrs. Annie Martin, Campbell.

Fruit Rolls

Two cups flour, two teaspoons baking powder, half teaspoon salt, sifted together. Add two tablespoons butter and two thirds cup milk. Knead well and roll to quarter inch thickness. Brush with melted butter and sprinkle with sugar and cinnamon, half cup raisins and two tablespoons citron chopped fine. Roll like a jelly roll and cut into pieces about three inches long and bake in a hot oven about 20 minutes.—Mrs. C. A. Jenks, Hanford.

Raisin Fritters

One cup of yeast or bread sponge, half cup warm milk, salt to taste, three eggs. Beat all together and add flour to make a thick batter. When light add one cup seeded or seedless raisins. Let rise again and fry in hot lard, using a tablespoon to take the batter up with and cutting or scraping it with a knife to give a smooth oblong shape (the fritters should be about the size of an egg when done). Serve warm. Those left over may be heated in the oven and rolled in powdered sugar, but we think they are good enough without it.—Mrs. A. J. Regier, Wasco.

Stuffed Spare Ribs

Place one side or one half the desired amount of spare ribs in a baking pan hollow side up and fill center with a mixture of three cups of dried apples and one cup of raisins, soaked and cooked soft, then drained. Lay the other half of ribs, hollow side

down over this. Sprinkle salt and pepper to taste over top, put enough water in pan to keep from burning and bake in a rather hot oven about one hour or until done, according to thickness of meat.—Mrs. A. H. Stockdale, Pasadena.

Jellied Prune Ring

Soak one-third of a pound of prunes over night in cold water. In the morning simmer slowly until soft, stone them and cut in pieces. To the prune juice add enough boiling water to make two cups of liquid. Pour it over two and one half tablespoons of gelatine dissolved in a half cup of water, then add one cup of sugar and four tablespoons of lemon juice. Strain, add the cut prunes and pour in a ring mould. Turn out when thoroughly chilled, fill the center with whipped cream sweetened and flavored with vanilla. Garnish the base of the dish with well plumped cooked prunes and whipped cream squeezed through a pastry tube.—Mrs. D. D. Dettweiler, Alta Loma.

IDEAS FOR THE COOK

Written for California Cultivator
By Isabel Cottle

Breakfast

Oatmeal, Cream
Country Sausage Fried Apples
Johnny Cake, Maple Syrup
Coffee

Lunch or Supper

Cream of Vegetable Soup
Tuna Salad Nut Bread
Apple Pie Cheese
Tea

Dinner

Hamburger Steak Baked Potatoes
Egg Plant, Creole
Lettuce, French Dressing
Prune Roll Coffee

Egg Plant, Creole

Pare and cut a large egg plant in slices, then cut the slices to cubes half an inch or less in diameter. Pour boiling water over the cubes and let cook until tender (about 20 minutes). Melt two tablespoons of butter in a saucepan, add two onions, peeled and chopped fine, half a green pepper, chopped; stir and cook until the onions are softened and yellowed slightly, add the cubes of egg plant, drained, a cup and a half of soft bread crumbs, half a teaspoon of salt, a dash of paprika and about a cup and a half of fresh or canned tomato, cut in pieces; stir until thoroughly hot, turn into a buttered baking dish, cover with three-fourths cup of cracker crumbs mixed with three tablespoons melted butter and let cook in the oven 15 or 20 minutes.

Cream of Vegetable Soup

Wash, pare and dice about three medium sized potatoes, two small onions, also cut up sufficient celery to make one cup and two or three peeled tomatoes. Pour over boiling water and cook until thoroughly tender, then remove from stove and add a small pinch of soda. Add the contents of a small can of condensed cream or one cup of rich milk. Reheat, but do not boil, and serve at once.

Fried Johnny Cake

Sift together a scant half teaspoon of salt and two cups of cornmeal. Pour on just enough boiling water to scald the meal without making it sloppy. Let stand about 15 minutes, then stir in enough rich sweet milk to make a stiff batter. Drop in tablespoonfuls on a hot, greasy frying pan, let brown on one side, then turn and brown on the other.

Prune Roll

Prepare a good biscuit dough, using say two cups of flour to four level teaspoons of baking powder, a pinch of salt and a teaspoon of sugar. Sift these together, then with the finger tips work in about one third cup of shortening. Add sufficient milk to make a dough that will roll nicely. Roll about one half inch thick and spread with pitted, stewed prunes, then roll up, the same as for jelly roll, moisten edges and press together. Place in baking pan and pour around it some of the juice from the stewed prunes, sprinkling over a little sugar,

and bake until brown and well done through. Serve with whipped or thick cream.

HOUSEHOLD QUERIES

Home Made Vinegar

Please tell how to make or start "mother" for vinegar; also how to make vinegar from watermelons.—Subscriber, Clovis.

For ordinary household use an excellent quality of vinegar may be most economically made by saving fruit juices, odds and ends of jelly, washed parings of various acid fruits, adding now and then a bit of cold tea or some rain water. These should be put in a stone jar with a clean cloth tied securely over the top and set where the rays of the sun will strike it. To this should be added a small quantity of vinegar or some "mother". Where one is unable to obtain "mother" a bit of brown paper will answer the purpose. As soon as the vinegar becomes strong enough drain off into clean vessels and continue to fill up the jar with fresh juices, etc. Though we have never tried using watermelons no doubt if crushed and used the same as fruit parings they would form vinegar.

Vinegar Without Cider: Take a gallon of cornmeal and boil in water until it is soft; put it into a ten-gallon barrel and fill with strong molasses and water. Two gallons of molasses will be about the right quantity. Leave the bung out and tack a piece of cloth over the hole. In a short time it will be good vinegar. If it should be too weak, more molasses and water can be added or the washings of vessels

Quick—Which Line is Longest,

A OR B?

If you say B is, then something is the matter with your eyes. Your visual power is defective and you should have it corrected at once. A and B are exactly the same length.

Many people think their eyes are in perfect condition when in fact they need attention badly—need the attention of an eye specialist—an oculist.

Speaking of eye troubles, Dr. C. N. Hopkins, the noted specialist, says: "It seems that when a person's eyes trouble him, nearly everything is blamed except the eyes. The nerves, the stomach and other organs get their share of the blame, but the person, as a rule, is reluctant to properly place the blame. If you feel irritated or get a headache when using your eyes, or have even a suspicion that your eyes are not perfectly normal, by all means consult an oculist at once."

Dr. Hopkins, with his nineteen years' experience in Los Angeles, is probably the best known eye specialist in the city. His large offices are in the Homer Laughlin Building, 315 South Broadway, Los Angeles. He is especially recommended because of his wonderful treatment of all eye ailments and in prescribing and scientifically fitting glasses to the eyes without drugging them.

HONORBILT SCHOOL SHOES

"WEAR LIKE IRON"

PUT your boys and girls into Honorbilt School Shoes and watch how they wear—twice as long as other school shoes, sold at the same price. Double leather toes, strong, pliable uppers, solid oak tanned soles, seams sewed with extra rows of stitching. Good-looking, stylish, built to fit growing feet. **THEY WEAR LIKE IRON.**

WARNING—Always look for the Mayer name and the trade mark on the sole. If your dealer cannot supply you, write to us.

We make Mayer Honorbilt Shoes in all styles for men, women, children; Dry-Sox wet weather shoes; Honorbilt Cushion Shoes; Martha Washington Comfort Shoes.

F. Mayer Boot & Shoe Company, Milwaukee HONORBILT

THE CUMNOCK SCHOOL OF EXPRESSION

offers a three year course which gives adequate professional training to public readers, story tellers, teachers of Expression and dramatic directors. The studies included in the curriculum have the highest cultural value. For instance:

Literary Interpretation
Public Speaking
Dramatic Art

Story Telling
Physical Training
The Voice

Expression through Writing

Catalogue on Request

CUMNOCK ACADEMY

Accredited school, with four year course, college preparatory or general. Special subjects by the Expression School faculty. Write for catalogue.
(Subpreparatory department—seventh and eighth grades).

Charming, Retired Location

The Cumnock Schools are situated in their own beautiful buildings and grounds, in a charming, retired location. All out-door sports; gymnasium, basketball, tennis horseback riding.

Citrus Fruit Market

LOS ANGELES, Oct. 20, 1915.

At present rate shipments of Valencia's will not be cleaned up by the end of the shipping year. It now appears that it will be November 10 before the last cars go forward. The market at present is fair, better grades of fruit being taken at prices about the same as prevailed last week. Lemons are in fair demand.

Shipments

Shipments of oranges from Southern California to date since November 1, 1914: 32,886 cars, lemons 6703, total 39,589. To same date last season; oranges 38,378, lemons 2859, total 41,237. From Tulare County: oranges 5651, lemons 209, total 5860. To same date last season, oranges 5875, lemons 41, total 5916. From northern counties: oranges 670, lemons 2. To same date last season: oranges 404, lemons 5.

NEW YORK, Oct. 18.—Sixteen cars Valencia's, one mixed car and three cars lemons sold. Market generally better on choice grades oranges; lemons unchanged. Fair and warm.

CALIFORNIA CREAMERY OPERATORS

The California Creamery Operators' Association will hold a convention at Convention Hall on the exposition grounds at San Francisco, October 28, 29 and 30. In connection with the convention will be a butter scoring contest. The usual fare and a third rate will be granted by the railways to convention attendants. The following program will be presented:

Address of welcome, D. O. Lively, chief of live stock, Panama-Pacific International Exposition; response, E. B. Stowe; president's address, U. H. Roussel; New Laws Affecting the Creameries, F. W. Andreasen, secretary, state dairy bureau; The Butter-maker and the Market, S. H. Greene; Cost of Producing Butterfat, F. H. Dethell, United States dairy division; Pasteurization of Cream for Butter Making, John Solis; Detailed Records, J. C. Phillips; address, A. J. Glover; State Department of Weights and Measures, C. G. Johnson, state sealer; Disposal of California Surplus Butter, E. H. Webster; Milk and Cream Supply of San Francisco, Dr. Wm. C. Hassler, San Francisco health department; Cooperative Marketing of Butter, C. L. Mitchell.

HOUSEHOLD QUERIES

TO GET AHEAD

"To push on in the crowd," says he, "every male or female struggler must use his or her shoulders. If a better place than yours presents itself just beyond your neighbor, elbow him and take it. What a man has to do in society is to assert himself. Is there a good place at table? Take it. At the treasury or the home office? Ask for it. Do you want to go to a party to which you are not invited? Ask to be asked. Ask A, ask B, ask Mrs. C, ask everybody you know; you will be thought a bore, but you will have your way. What matters if you are considered obtrusive, provided that you obtrude? By pushing steadily, nine hundred and ninety-nine people in a thousand will yield to you. Only command persons and you may be pretty sure that a good number will obey. If your neighbor's foot obstructs you, stamp on it; and do you suppose he won't take it away?"—Thackeray.

IN A STATE OF BELLIGERENCY

"Well," said he, anxious to patch up their quarrel of yesterday, "aren't you curious to know what's in this package?"

"Not very," replied the still belligerent wife, indifferently.

"Well, it's something for the one I love best in the world."

"Ah, I suppose it's those suspenders you said you needed."

HAS IT IN THE FAMILY

"My dear," remarked Jones, who had just finished reading a book on "The Wonders of Nature," this really is a remarkable work. Nature is marvelous! Stupendous! When I read a work like this it makes me think how puerile, how insignificant is man."

"Huh!" sniffed his better half. "A woman doesn't have to wade through 400 pages to find out the same thing."—Judge.

FREE UNTIL 1916

Have you subscribed yet for The Youth's Companion for 1916? Now is the time to do it, if you are not already a subscriber, for you will get all the issues for the remaining weeks of 1915 free from the time your subscription with \$2.00 is received.

The fifty-two issues of 1916 will be crowded with good reading for young and old. Reading that is entertaining, but not "wishy-washy." Reading that leaves you, when you lay the paper down, better informed, with keener aspirations, with a broader outlook on life. The Companion is a good paper to tie to if you have a growing family—and for general reading, as Justice Brewer once said, no other is necessary.

If you wish to know more of the brilliant list of contributors, from our ex-Presidents down, you will write for the new volume in 1916, and if you wish to know something of the new stories for 1916, let us send you free the Forecast for 1916.

Every new subscriber who sends \$2.00 for 1916 will receive, in addition to this year's free issues, The Companion Home Calendar for 1916.—The Youth's Companion, Boston, Mass.

LOUDEN

BOOK OF BARN PLANS FREE

If You Intend to Build a New Barn or Re-model an Old One You Should Have This Book

Louden Barn Plans is not a catalog of barn equipment. It is a complete and valuable book of reference and instruction on barn construction.

The 96 pages of Louden Barn Plans are full of dollar-saving information. It contains 51 representative designs for cow barns, horse barns, combination and general purpose barns, as well as many other designs for hog barns, pens, hay sheds, chicken houses, etc.

In addition to the barn plans shown in the book, there are 32 pages devoted to general construction problems, such as concrete work, laying floors, roof construction, ventilation, etc.

When Writing for This Book Please State When You Expect to Build, and How Many Cows and Horses You Want to House

We have designs for nearly 4,000 barns, and our architects will give your letter personal attention if we learn your exact requirements.

Louden Barn Equipment

Louden equipment makes possible a clean, sanitary barn with a minimum of expense. When cows are transferred from dark, dirty barns to Louden barns the milk flow often increases from 15 to 25 per cent, and the labor of caring for the herd is reduced from one-third to one-half. Louden equipment is just as great economy for the man with a half dozen head of stock as for the man with hundreds of animals. The percentage of labor saved is the same.

The Louden Line of Sanitary Steel Equipment Includes:

Litter Carriers	Cow Stalls	Hay Loft Equipment	Sheep Pens
Feed Carriers	Horse Stalls	Cow Pens	Water Basins
Milk Can Carriers	Mangers	Calf Pens	Bird Proof Barn Door
Harness Carriers	Manger Divisions	Bull Pens	Hangers
Hay Carriers	Feed Racks	Hog Pens	Power Hoists and
Feed Trucks			Other Barn Specialties

Motorists! Cut Fuel Bills Save 25% to 50% on Gasoline

by using "Gomor," the scientific lubricant. "Gomor" is poured into ordinary gasoline and thus introduced into the motor through the carburetor with the gas. At every explosion "Gomor" is sprayed on cylinder walls, pistons, valves, etc., thus positively eliminating carbon formations. It greatly lessens friction, makes gasoline vaporize quicker and motor run perfectly on very lean mixture. One quart of "Gomor" is sufficient to treat 80 gallons of gasoline. Thus, if your gas tank holds 10 gallons, add one gill (1/4 pint) of "Gomor" when filling.

Positively Increases Mileage 25% to 50%

"Gomor" is a scientific lubricant, and is the invention of a well known Detroit chemist. It contains nothing injurious to motors—it is a great benefit to motors. Do not confuse "Gomor" with any of the ether, camphor or other harmful chemicals that are sometimes employed to temporarily increase speed.

"Gomor" is a high grade lubricant that withstands the heat generated in any gasoline motor. It keeps a thin film of oil on vital parts of the motor that are imperfectly lubricated or inaccessible to usual methods of lubrication. Thus friction is lessened and motor runs with more power. In this way, mileage per gallon of gasoline is increased 25% to 50%—a big saving you will appreciate.

Four Year Tests

"Gomor" is not an experiment. Upward of one thousand tests of "Gomor," covering a period of four years, have been made. These tests have been conducted by leading automobile engineers and have been most exacting. Many motor companies and thousands of private owners testify to the merits of "Gomor."

Saves Wear on Motor

Friction is the thief of power, and "Gomor" reduces friction to a minimum. "Gomor" saves wear and tear on motors and thereby greatly increases their life. Our exhaustive tests have proved this fact.

"Gomor" must do all we say—else we will refund your money

The Gomor Oil Company is a thoroughly responsible concern backed by a number of Detroit's leading business men. "Gomor" is widely used in the East, and is now being rapidly adopted by Western motorists.

"Gomor" sells for \$1.00 sample quart can, prepaid to your address. "Gomor" really costs you nothing, because it saves its cost many times over in reduced fuel bills. Order today or send for booklet, testimonials and sworn proofs.

International Harvester Wagons—Weber—Columbus

WHEN your old wagon is just about gone and you're thinking of buying a new one, sit down and do a little figuring. What kind of service has that wagon given you? How many delays have you had because of accident and breakdowns? Could you always get repairs easily? How long has it lasted? You have to add all unnecessary expense to the price you paid at first, to find out what your wagon really cost you.

When you have these figures you will see at once the advantage of buying a **Columbus** or **Weber** wagon. They give you steady service, with no delays. You can get repairs any day you need them. The folding endgate and link end rods make them easy to load and unload. The fifth wheel—an exclusive feature on these wagons—adds years to their life.

When you are ready to buy a new wagon and want the one that costs the least per year of service, drop us a line. We will direct you to the nearest **Columbus** or **Weber** wagon dealer and give you information that will make it easy for you to buy one of the best wagons you ever owned.

J. H. Hale — The Great Commercial Peach For California

- A peach so solid and firm it ships thousands of miles.
- A peach that keeps for days after reaching market.
- A peach of immense size, many weighing a pound each.
- A peach dense and solid, almost like a cling, yet perfect freestone.
- A peach that sells for \$2.00 to \$2.50 per bushel, when Elberta and ordinary varieties are bringing \$1.00 to \$1.50.
- A peach that paid Mr. Hale at the rate of \$1420 per acre.
- A peach of highest quality, flavor, brilliant coloring.
- A peach that makes money no matter what markets are.
- A peach that means millions of dollars to California growers.

The J. H. Hale

"A peach that would go to European markets from California."—Parker Earle, Pasadena, Cal.

Read the Whole Story! Send for Free Book Today!

Be Sure of Genuine J. H. Hale Peach Trees
Beware of fakers offering so-called "J. H. Hale" trees, or old "Hale's Early," of no commercial value. There is only **one genuine** J. H. Hale peach, grown by us under exclusive contract with Mr. Hale. Trade-marked tag with Mr. Hale's personal signature is your guarantee and protection. Look for it!

Read how Mr. Hale originated this great peach—how he tested it for 12 years—how he shipped it in a barrel like apples—how he got \$380 MORE per car for J. H. Hales than for Elbertas. Find out all about this wonder peach, its size, beauty, yield, quality, how it sold at highest prices in a season of glutted markets—how it will make money for **you**. Hundreds of acres are being set out on the Pacific Coast. Don't wait. Write for the FREE 160 page Book today!

The Early Rose—The Best of all Early Peaches

Its exceptional quality and flavor, deep, rich rosy color and marked peachy fragrance sold carload after carload on the New York markets in June at 50% to 60% higher than other varieties.

The Early Rose is to early peaches what the J. H. Hale is to commercial peaches—the best quality and highest profit-maker in its class. We are introducing the Early Rose to growers who are looking for an unusually early peach with exceptional quality, and one that is an extra good shipper. Our supply is limited. Write for catalog at once.

The Early Rose paid Mr. Hale \$3.00 to \$3.50 per crate—the highest price of any peaches on the market for a season of over two weeks.

Delicious Apple—Another Money-Maker

Everybody knows Delicious—and the profits that it brings. It is the great national dessert apple—beautiful in appearance, dark red striped, firm, crisp, tender flesh, and with a surpassing flavor, mild, luscious and tempting. A plateful of Delicious will perfume a whole room. Delicious is a splendid keeper and shipper—stands lots of handling—brings more per box than most apples do per barrel. Succeeds in lower elevations in California where other apples fail. You can now get genuine Delicious trees direct from William P. Stark at prices you usually pay for ordinary varieties. Write for low growers' prices.

Delicious reaches high colored perfection on the Pacific Coast.

Thousands of Pacific Coast Growers Buy William P. Stark Trees Yearly

We have customers in every Western state. They buy from us year after year, because they get better developed, thriftier, more vigorous trees, with heavy, dense, wide-spreading root-systems such as they cannot get anywhere else. These trees establish themselves

quickly and make an amazingly rapid, healthy growth. The William P. Stark "3,000 Mile Package" ensures safe delivery to any shipping station in the world. And best of all, by buying direct from the nursery you cut out all agents' and salesmen's salaries and commissions. You save from 30% to 50% on your order.

Send For New 160 Page Book FREE!

The handiest reference book for fruit growers ever published. Describes best apple, peach, pear, plum, cherry, grape, bush-fruits, roses, strawberries, etc. Prices in plain, bold figures. Same low growers' prices to all. Write today.

LOS ANGELES: THURSDAY, OCTOBER 28, 1915

One Dollar Yearly

The Panama-Pacific Cattle Show Winners

Excellence of the Show and the Winnings of Pacific Coast Entries a Great Tribute to Our Live Stock Growing Conditions. Many Animals of International Reputation Exhibited. Written for the California Cultivator by W. S. Guilford

HE judging of the Panama-Pacific International Cattle Show started on Monday, October 18 and continued without interruption until Saturday, October 23.

It was a great show. There was the keenest of competition and the big crowds both in the judging ring and in the grand stand attested to the interest of Californians and Pacific Coast

the mild climate and the abundance of feed for dairy cattle that can be produced here.

We have better Ayrshires on the Pacific Coast than were ever grown in Scotland, and this hardy dairy breed is rapidly coming into its own in our hill dairy districts.

Our cattle ranges now produce large numbers of high class beef animals, but there is plenty of room for

Shorthorn Cattle

The show of Shorthorns was highly commended by the many live stock authorities in attendance. The prizes were very well divided among the several exhibitors.

The Hopland Stock Farm exhibited 15 head and won 23 prizes, including grand championship bull on the senior yearling, Bobbie Burns.

The Allen Cattle Company of Colorado Springs, Colorado, also won heavily and had the grand champion female in the senior yearling heifer, Belle Cumberland. Mr. Allen states that Shorthorns are in very great demand at good prices all over the intermountain country.

The A. Chambers herd from Forest Grove, Oregon, gave a good account, the aged bull, Scottish Baron, attracting especial attention because of his depth and width of body, masculine head and character and the excellence of his calves.

A few animals of especial merit were exhibited by the Paicines Ranch Company, Paicines, San Benito County, owners of one of the largest Shorthorn herds in the West. This company now owns the famous Howard herd.

The dairy Shorthorn prizes were won by the Misses Alexander and Kellogg of Suisun, with a very attractive lot of cattle.

The interests of the breed were

in the Hereford classes. George Chandler, Baker, Oregon, had the only full herd of breeding cattle. The University of California exhibited a junior yearling bull that many believed should have been made champion of the show instead of reserve champion. A splendid lot of steers and heifers were shown by the Kern County Land Company, Bakersfield, and by the University of California.

Aberdeen-Angus Cattle

This beef breed was represented in the show by one bull and four steers from the University of California, five excellent individuals. The growing of more beef cattle on smaller farms will undoubtedly see a big increase in the numbers of this great beef breed in this state and the university is the leader in showing what Angus cattle will do.

The steer, U. C. Jock, born January 11, 1914, weighs 1410 pounds, and was made grand champion. A steer in the under six months class, California Thickset, is a smooth, evenly fleshed animal that promises to come on and make one hard to beat another year.

University of California Steers

As was indicated last week the wonderfully finished Hereford, Angus and cross bred steers shown by the university farm at Davis were a sensation. They are models of perfection and afforded a lesson of great value to

Prizewinning Red Polled Cow Shown By R. R. Cartwright of Angels Camp.

farmers and breeders in the great live stock industry.

California has been known all over the world for the excellence of its fruit crops, for its oranges and peaches and prunes and everything in the list of fruits and vegetables, and it has been famous for its wonderful climate and splendid resorts, but the importance of the live stock business is sometimes overlooked.

It must not be so. There has never been a permanent agriculture any where on this earth that did not have for its basis a substantial live stock industry. California and the Pacific Coast is coming into its own.

This great cattle show is one of the many evidences of the fact that nowhere in the world can better live stock of all kinds be produced than here.

We all know what our Holsteins can do. This has been written in the records of production of the American Holstein-Friesian Association. The founders of the breed in this state builded well and their efforts have been ably furthered by those who are carrying the banner at the present time.

Chas. L. Hill, of Rosendale, Wisconsin, the judge of Guernseys and one of the great Guernsey breeders of the world, says that no better animals are produced anywhere than some of those exhibited that were grown on the Pacific Coast, and that we unquestionably have a great advantage over breeders any where else because of

many, many more herds of Shorthorns, Herefords and Aberdeen-Angus.

There are many places in the state where the cost of feeding and caring for a steer or beef cow, where pasture is cheap and little labor is required, is figured at \$20 per year or less as against a cost of \$75 or more per year in many places in the East. This certainly constitutes a great advantage to our growers.

The show management and the breed associations are to be congratulated on their choice of judges. The ratings were made by men who thoroughly understand the best ideals of the various breeds and the ribbons went to those animals considered by the judges most worthy to receive them, regardless of ownership.

There was praise from all quarters for Chief of Live Stock D. O. Lively and his assistants for all of the things that go to make a successful show, and this includes everything from the arrangement and architecture of the buildings and judging ring to the courteous treatment of exhibitors and spectators.

Preparations were complete for a world's fair show the like of which was never before assembled—the unforeseen and unfortunate foot and mouth disease situation alone prevented it.

There was much good weather for the show and visitors marvelled at the beauty of the buildings and the setting. There are few if any places on earth where it could be equalled.

Champion Guernsey Bull Owned By W. H. Dupee, Santee

well looked after by Secretary Frank Harding. He was very much pleased with the show but states that had it not been for the quarantine one of the largest and best shows of the breed ever made would have been here.

As has been stated frequently before, there is a great field in California for Shorthorns, and we should see a big increase in the number bred in the next decade.

The Herefords

There was very little competition

California farmers. Capt. T. E. Robson of Canada, the Shorthorn judge and an eminent authority, stated that they were good enough to win at any show in the world.

Red Polled Cattle

Two excellent herds of Red Polls competed for the prizes.

Brown Swiss

One herd, that of B. P. Inman, Junction City, Oregon, won all of the prizes given for the breed. There are a good

More HOP Profits More Bales per Acre

Hop Growers who have taken advantage of our free service department have found it profitable. They have made money through our advice. We have shown them how to increase the number of bales per acre. What we have done for others we will do for you. Write us fully and frankly. Let us know the exact conditions you are working under. Send a sample of soil and we will tell you how we can help you. You will not be obligated in any way. We want every Hop Grower to know all about

Gaviota Fertilizer

How it increases land values while increasing the land's yield. We want to send you positive proof of the wonderful increases it has made. How it feeds the crops and improves their quality.

Read what Hop Men Say:

From a Grower in Sonoma County:—"After using HOP Brand for two years, I am thoroughly well satisfied with results both in production and quality."

Another Sonoma Hop Grower:—"I began using your HOP Fertilizer in 1911 and increased my yield from 180 bales to 378 bales."

From Sacramento County:—"I purchased HOP Fertilizer last year and have had splendid results."

Still Another From Sonoma County Says:—"HOP increased my crop from 8.36 bales per acre to 13.14 bales."

We will furnish the names of these men on application.

"The Care and Feeding of Crops"

is a little book that tells you in plain English some valuable truths about the correct way to put back into the soil those elements which the crops take out. It tells you how to increase the size of your crops and how to make your land more productive. Write today for a copy free.

Deciduous Fruits

PRUNING THE WALNUT

Written for the California Cultivator
By Sacramento Valley Contributor

ANY people believe that there is something very mysterious about the English walnut and that it cannot be handled and pruned and cared for as other trees are. Some believe that if the tap root is cut the tree will be no good and that if the top is pruned like that of other trees great injury will be done. That both of these ideas are wrong is proven by thousands of good trees grafted in the nursery and pruned like other trees as they grow in the orchard.

There are some general laws of nature that apply to nearly all trees. If a bud or graft of the variety of fruit desired to be propagated is placed in a root stock with which it will make a good union, and the conditions are right, it will make a satisfactory growth in the nursery row whether it is English walnut on black or hybrid root, prune on myrobalan or peach or other root, peach on peach root, or any of the other many satisfactory combinations.

And when these young trees are dug from the nursery some of the roots must necessarily be cut off. Nevertheless they will grow, if soil, moisture and cultural conditions are right and the young trees are properly handled.

The same general principles must be observed in pruning the walnut tree as in any other. During the first few years of its growth it should be so trained as to make a strong frame work for a superstructure of bearing wood. And this cannot be accomplished by letting long "leaders" grow without pruning. In this case the load of fruit must be sustained at the end of long limbs and that brings pressure on the crotch, where it joins the tree like a long lever. The same thing is true of the unpruned prune tree.

This fact about the pruning of the walnut was brought out emphatically at the Nurserymen's Convention in San Francisco by Geo. C. Roeding of Fresno and many other authorities. It was stated that because some of our newer plantings in California are being properly handled they will undoubtedly become the best in the world, for many old plantings in this state and in Europe have not been properly pruned—to their detriment at the present time.

WESTERN WALNUT ASSOCIATION

The secretary of the Western Walnut Association is sending out announcement of the first annual convention of that body which is to be held at Portland, Oregon, November 3 and 4.

"The Western Walnut Association is organized to supply the demand for information relating to the walnut industry in the Pacific and Western states, how best to plant, grow and market this king of all nuts. The importation of walnuts has increased for the last 15 years from 11,000,000,000 pounds in 1902 to nearly 40,000,000 pounds in 1914. The price as well as the consumption is increasing, and

every effort should be made to increase home production by right methods."

The officers of the new association are: President, J. C. Cooper, McMinnville, Oregon; vice president, Dr. C. H. Chapman, Woodland, Washington; vice president, A. A. Quarnberg, Vancouver, Washington; vice president, F. A. Wiggins, Toppenish, Washington; vice president, Walter F. Burrell, Lewiston, Idaho; vice president, Ferd Groner, Hillsboro, Oregon; vice president, M. McDonald, Orenco, Oregon; secretary-treasurer, H. V. Meade, Orenco, Oregon.

The program as announced is: The Walnut Industry, Prof. C. I. Lewis, Oregon Agricultural College; Planting, W. W. Reburn; Cultivation, Ferd Groner; Varieties, A. A. Quarnberg; Nut Foods and Nut Distribution, Dr. W. C. Deming; Harvesting and Marketing, T. A. Harper; Irrigating Walnuts, F. A. Wiggins.

MARKETING OUR PEACHES

The peach crop of the country will amount this year, it is estimated, to more than 58,000,000 bushels. With the application of more scientific methods the crop has increased greatly in recent years and the peach grower is now confronted with problems of marketing rather than of production. Owing to their perishable nature peaches are unusually difficult to dispose of without loss, and good distribution is essential to prevent the glutting of some markets while scarcity and high prices prevail elsewhere.

In order to facilitate proper distribution the United States department of agriculture has just published the results of a study of the movement of the peach crop in 1914. Georgia it is found ships practically double the amount of any other state, 4803 carloads coming from there in 1914. California, Washington, Ohio, Michigan and Colorado follow with shipments of between two and three thousand cars. The other states bring the total to thirty thousand carloads.

In handling this vast crop there is no uniformity in packing or grading. A change in this respect would it is said result in a higher level of prices for high-grade fruit can almost always be disposed of. Another recommendation is that dealers in the smaller towns cooperate in buying peaches by the carload and in pushing their sale.

YUCAIPA'S APPLE SHOW

On November 4, 5, 6 the fourth apple show will be held at Yucaipa. This promises to excel anything of a similar nature ever held in Southern California. Yucaipa and Oak Glen now have a planted area of over 5000 acres. Most of this is set to apples but there are several hundred acres of pears, cherries and peaches. All of these fruits will be on exhibition. As only the finest specimens will be shown, it will pay any one interested in deciduous fruit growing to visit Yucaipa during fair week. Here will be shown an industry of which Southern California may well be proud.

The management promises ample entertainment in the way of refreshments, sports, side shows and all that goes to make an apple fair.

HEMET-SAN JACINTO VALLEY GROWERS' ASSOCIATION

Written for California Cultivator
By Jay Dutter

On Saturday evening, October 16, the fruit growers of this valley met and adopted by-laws and elected board of directors; and are now incorporated under the laws of California. The name of the association is the Hemet-San Jacinto Valley Growers' Association.

The board of directors is composed of some of the most representative men of the valley, all experienced business men, who are sure to conduct the affairs of the association successfully. They are D. W. Amos, president; John Hodges, vice president; Edward Schmidt, secretary-treasurer. The executive committee is composed of Messrs. Amos, Schmidt and M. B. Rideout; the other members of the board are Dr. J. R. Wilson, Dr. J. S. Thompson, Walter C. Carr, W. J. Ferrell, John Nelson, John Bair and Burdette Raynor.

The board immediately took steps toward arranging for the handling of the olive crop, for which fortunately the central association has a market waiting, the whole success of the co-operative movement depending upon the distributing system which the growers have undertaken to try to correct.

In the present system there is an enormous waste of money in handling the produce from the producer to the consumer; this year the one-tenth or so of the peach crop which was saved sold at a price ranging around eight dollars per ton; the price to the consumer ranges from \$200 to \$300 per ton; the jobber disclaims any undue profit, as does the retailer; the freight charge is fixed, as is usually the canner's profit, but there should be less handling by freight—in many cases one haul could be eliminated.

In this maze of handling and frantic denials of profit it is hard to lay the blame on any one in particular, but there is one way that the matter may be settled to the entire satisfaction of all concerned (except the middle men), that way is for the growers to organize into cooperative associations, join together in cooperative selling associations, and sell the produce themselves. Then they may know who has the profit, and in this manner the price may be reduced to the consumer so that an outlet for the entire crop may be had, where it would otherwise some years have to rot on the ground as it has this year.

With a proper system of handling by the producer canned fruit can be sold to the consumer at from 40 per cent to 50 per cent less than at present prices and still net the grower from \$25 to \$40 per ton for peaches and apricots, and sell all of them, where under the present conditions he often loses much of his crop and often receives so little for it that he is minded to dig up his trees.

But if the growers will awaken to the fact that organization is their salvation, by staying with this idea and following to completion, he need not lay awake nights all during the spring wondering if he will be able to sell his fruit. There are millions of people waiting to buy fruit if it can be had at a price which they can afford, and the man that grows the fruit is the man that can make that price and no other; if left to the jobber or retailer to dictate, it never will sell. The grower must be the canner, the jobber and make the price, and the only way to

accomplish this is to organize and all come into one selling organization.

That is the work now being successfully accomplished. The work of organization has been largely completed in Hemet under the direction of Vernon Campbell, manager of the California Growers' Association and by Jay Dutter, who is acting as organizer for the association. The work has been accomplished successfully under the most adverse conditions, the growers having had such a disastrous year that money is very hard to raise for necessities, let alone for financing a cannery association, but the growers have come to the realization that this is the only hope and the only insurance against further possible disaster.

Some of the best financiers and the department of agriculture are encouraging the movement. When this is accomplished and a just system of rural credits established so that the farmer may have 20 or 30 years in which to pay for his farm, instead of being compelled to pay seven to eight per cent

interest and on top of that raise the price to pay for his place in from four to seven years, and that on a promoter's or speculative price, we may at last see prosperity and hope in sight.

Let us tighten our belts, join hands and go forward to success.

WALNUTS IN FRANCE

A recent personal inspection of some of the best growing grounds in the Isere Valley indicates, writes United States Vice Consul Murton at Grenoble, France, that the production this year of walnuts of all grades will be unusually large and fine in this region. The trees, even at this advanced season, are still well in leaf, green, and healthy looking, and for the most part covered with nuts. In only a few places were signs of blight, or, rather, of decay, observable. The percentage of drop-offs is remarkably small this year. The fruit maturing is large, sound, and meaty, well developed, and fairly regular in size. It is clean and

comparatively free from spots. The proportion of diseased or wormy, shriveled, and imperfectly developed nuts appears to be small. The outlook is most encouraging.

Ripening is progressing normally, favored by fine, dry weather, warmth and sunshine, without too great heat or too much rain. That these crops will prove to be considerably above the average is the opinion of everyone competent to judge. They are already practically assured.

Secretary John Hall of Rochester, New York, is mailing to members the proceedings of the meeting of the American Association of Nurserymen which was held at Detroit in June. The book contains reports of officers and committees and also addresses and discussions during the convention. The 1916 convention will be held at Milwaukee, Wisconsin.

The Kittitas Valley Harvest Festival had an attendance of over 5000.

These Goodyear Tires Made Extra-Large

Sizes 30x3½ and 30x3

We are this year giving special attention to users of small-size tires. There are about a million of them. And the tire we build would win them all if all of them could know about it.

\$317,000 Added

This year we are building these tires larger than ever. We've increased the air capacity by 20 per cent. Added size means added mileage, as every user knows.

We have added 30 per cent to the rubber in the side walls just above the bead. That's where constant bending taxes tire walls most. And where thin-walled tires often chafe and break.

We have made new molds to improve the tire's design. For we have found a new shape which increases endurance.

These three additions will add to our tire cost \$317,000 this year. Yet this year we made another big price reduction—our third in two years, totaling 45 per cent.

Four-Ply Tires

Even the smallest Goodyear Automobile Tires

**20% More Capacity
30% More Strength**
In Side Walls

are four-ply tires—even size 30x3. And our anti-skid tread—the Goodyear All-Weather—is double-thick on all.

So Goodyears have always been exceptional tires. They won on sheer merit the top place in Tiredom, and for years have outsold any other.

Now we add 20 per cent to the air capacity and 30 per cent to the rubber above the bead. And we give you a better design. We are building by far the most capable tires ever built in these small sizes.

So even the occasional mishap and misuse will find new strength to combat them.

Get These Extras

The value we give in Goodyear tires is due to our mammoth output. Get that value—it is due you. Smaller, thinner, lighter tires can't serve as Goodyears do. Even last year's Goodyears, though the leading tires, could not compare with these.

Any Goodyear dealer will supply you. Every neighborhood has a Goodyear Service Station with your size in stock, and it renders full Goodyear Service.

(2648)

THE GOODYEAR TIRE & RUBBER COMPANY, AKRON, OHIO

Makers of Goodyear "Tire Saver" Accessories; also Goodyear "Wing" Carriage Tires and Other Types

Orange Lemon Olive TREES

grown by experts in an ideal location where soil and water conditions are right. Our citrus and olive trees are two-year-old budded stock, strong and vigorous,—symmetrical of root, body and top. The selection of buds is true to the best type of the varieties to which they belong.

We have the Navel and Valencia Orange, Eureka Lemon, Mission and Manzanillo Olive trees.

Contract with us now and your money will go twice as far. We can give you low figures because we raised our own stock at a small cost. Each tree will be carefully balled and all shipments will be under the direct supervision of a man who knows how. We want your business. A postal will bring our special representative to you. His practical experience will be of value to you in buying and planting.

Get after this proposition right now while the matter is fresh in your mind. In writing, state about how many trees you will need.

AVOCADO GROWERS' MEETING

Written for California Cultivator

MOST enthusiastic bunch of avocado growers last Saturday filled the assembly room of the Hotel Alexandria at Los Angeles at a meeting of the California Ahuacate Growers' Association, presided over by Pres. E. G. Hart. A very attractive exhibit of fruits and trees proved so interesting that visitors stood five deep in front of them and the newcomer was forced to wait his turn and edge into the crowd before he could admire the rich looking fruit displayed. The varieties were plainly placarded and the many questions asked of the exhibitors showed the keen interest in avocados in general and the most promising new varieties in particular. The state university also displayed an exhibit of by-products, avocado oils, avocado flour, candied avocado seeds, etc.

Prof. I. J. Condit of the University of California gave news items on various phases of avocado growing in California, touching on the bearing trees scattered through the northern and central parts of the state. He said:

"One fact has been clearly demonstrated by some of these plantings, namely that water must be withheld in the fall and the trees properly hardened before the cold weather sets in, otherwise the tender growth will be cut back. It is this fact which renders it difficult to gather data on the frost resistance and hardiness of any tree but especially of evergreen fruit trees which have several periods of growth during the season. The hardiness depends to a large extent upon the degree of dormancy of the new growth."

The speaker described the work of the state experiment station in identifying insects and fungus pests affecting the trees and gave an interesting account of experiments which have been carried on in processing of various byproducts of the avocado, flour and paste, for flavoring soups, etc., and a confection made by candying the seed in syrup.

Score Card for Avocados

A tentative score card was distributed to the audience by Prof. Condit which will prove of interest to all growers. This will be published in a later issue.

Food Value of the Avocado

"Food Value of the Avocado" as presented by Prof. M. E. Jaffa of the state university, apparently justified the most enthusiastic avocado growers in their claims as to its desirability, not only as a salad and dessert fruit but as a food. Prof. Jaffa said that not only was the total food value of the avocado high, as shown by its analysis, but its dietetic value was exceptionally high. "The only fruit comparable with the avocado in value of its fat is the olive but the avocado ranks higher in this respect than the average olive. The latter fruit also has the disadvantage of requiring special treatment before it is ready for consumption and should really rank as a processed fruit rather than as a fresh one."

The Avocado in Florida and the West Indies

Mr. Wilson Popence, agricultural explorer of the United States department, gave a most interesting talk on the avocado industry in the West Indies and Florida. As to the Cuban industry he said:

"I believe it can truthfully be said that the avocado tree which receives systematic care in Cuba is very rare.

Most of the trees receive no cultivation whatever, but the soil is excellent, and they seem to thrive. Propagation is by seed, but in recent years the government and some of the most progressive horticulturists of the island have taken up budding with fairly good results.

"The fruits which go to market are picked usually before they are fully ripe, and when they reach Habana they are still hard. They are packed in sacks, boxes, or often hauled into town in a cart without any packing whatever. I have stood in the Tacon market at Habana and seen these fruits which were brought in from the country sorted into piles of different sizes, and then thrown from the ground into nearby wooden bins, a procedure which would certainly have been disastrous to fruits commencing to ripen, and which can scarcely be recommended under any circumstances. For export, the Cubans pack the fruits in empty kerosene boxes, orange crates or barrels, using no wrapping paper or packing material of any kind. The method is rather crude, and one hears a good many reports of Cuban fruit reaching New York in poor condition. In some cases, however, the loss is due more to other conditions than to careless packing, such as picking over-ripe and allowing it to heat in transit.

"There are a few good groves of Trapp avocados in the island, and also in the Isle of Pines. These have been planted by Americans, and have only recently come into bearing. They have demonstrated that the fruit will not hang on the trees so long in Cuba as it does in Florida, and also that the trees will make much more rapid growth. Failure to remain on the tree until late in the fall is something of a drawback, inasmuch as the highest prices are obtained in late fall and winter. The Guatemalan avocado may solve the problem, however. It is much earlier in Florida than it is in California.

"In most of the Florida groves the trees are planted about 24 by 24 feet. Sometimes this distance is decreased to 20 feet, so that the trees will shade the ground sooner; sometimes it is increased to 26 feet, so as to allow more room for ultimate development. They undoubtedly require more room on heavy soils than on light, and for this reason it will doubtless be necessary to plant at greater distances here in California. Experience has shown that the young trees should be kept heavily mulched; weeds, grass, palm leaves and seaweed are used for this purpose. During the winter season the mulch is sometimes removed, and the surface given very shallow cultivation; on the approach of summer the mulch is replaced, and cowpeas or velvet beans are often planted between the rows. A mulch should be kept around the tree until it is at least three or four years old, when the shade of its foliage and the accumulation of fallen leaves upon the ground may serve as sufficient protection from the sun.

"There is no established practice in regard to fertilizing avocados, each grower having his own ideas on the subject."

As to returns from Florida groves Mr. Popence said that \$5.25 per crate was a good average price the season through. A good grove of five-year-old trees should produce between four and five crates. Fruit shipped in October brings a lower price, often not more than two dollars per crate. The best prices are secured after Christmas. Some fruits marketed this year in early February brought \$36 per crate, so the aim of the Florida grower is to secure a variety that will fruit late. Most of the present Florida production goes to Washington, Philadelphia, New York and Boston, but a very good demand is now being built up in the Middle Western states. The only varieties commercially grown are the Trapp and Pollock. Probably 90 per cent of the total output is of

Trapps. This is a thick skinned, round green fruit which averages a pound to a fruit. It has proven an excellent shipper.

The standard package in Florida is the tomato crate 12 by 12 by 24 inches. Growers have largely discontinued the use of tissue paper wraps as the fruit heats more quickly in these wrappers. The fruit is now usually shipped in layers with excelsior between as a cushion.

At the close of his talk Mr. Popenoe was subjected to a rapid fire questioning from all parts of the hall which brought out further most interesting points on the avocado industry.

Station Work for the Avocado

Dr. H. J. Webber, director of the citrus experiment station at Riverside, impressed the necessity of finding proper regions of the state for avocado culture, suitable varieties and root stocks. He urged importing and testing out of every promising variety that could be found in Mexico, Central and South America and promised the aid of the experiment station in research work along these lines. He suggested the desirability of holding an exhibition of seedlings each year, awarding a medal to the best, in this way stimulating selection and breeding up of best varieties. In closing he urged great care to avoid introducing pests and diseases of the avocado, especially strict observance of quarantine regulations.

Things to Be Expected

Mr. C. P. Taft of Orange read a paper on "Things to Be Expected," predicting a prosperous future for the avocado industry and the avocado grower.

Marketing

Mr. J. C. Bosche, who has had some experience in marketing avocados from Mexico, said that he found a better demand for the fruit in San Francisco and Los Angeles in proportion to population than in any other cities of the United States, with the possible exception of New Orleans and San Antonio. He also impressed the undesirability of paper wrapping.

E. B. Rivers, wholesale commission merchant, spoke of the increasing demand for the fruit. He said: "We have orders coming to us from Arizona every week and it will only be a matter of a couple of years when this fruit gets down to a reasonable price that there will certainly be a big demand for it. Last winter we handled a good many fruits, getting \$12 a dozen for them." Mr. Rivers emphasized the point that one of the best ways of popularizing the fruit would be to make known the proper ways of serving it. Much good fruit is served in unpalatable mixtures which naturally prejudices the man who is tasting it for the first time.

The general discussion which followed the addresses was conducted by Dr. J. Eliot Coit of the state university.

Resolutions were passed by the meeting that the spelling a-v-o-c-a-d-o be used in referring to the fruit, also that the secretary of agriculture be asked to send a special agricultural explorer to Central America, Mexico and South America to look for cold-resistant varieties.

The big hit of the day was made by the salad, sandwiches and desserts all made of avocados, which were served at the noon intermission. The association distributed leaflets of recipes giving a dozen or more delicious ways of serving avocados and these we will give to our readers in a later issue.

Buying a Tractor

Did you ever stop to think that the development of the tractor has paralleled the development of the timepiece?

First came the sun-dial. It was cheap, but useless in rainy weather.

Then came the hour-glass. It needed constant attention to give results.

The alarm-clock was another step. It is big and cumbersome, lasts only a short time, and translates power into noise.

Now!

If you really wanted a first-class timekeeper you would buy an eighteen-jewel watch, compact and reliable. This is the kind of tractor the Yuba is. With eighteen sets of Hyatt roller bearings instead of eighteen jewels — compact, reliable, efficient and economical, the Yuba Ball Tread is the latest step in the evolution of the tractor.

RELIABLE TREES AND VINES

Established 1888. Wholesale growers of Deciduous and Citrus Fruit Trees, Olives, Shade and Ornamental Trees, Grape Vines, etc. Our largest order last year was for 200,000 Deciduous Trees. This customer advises that he has 98 per cent stand. Let us supply your order this season—large or small. What do you expect to plant? Address Main Office, 2501 Tulare Street, Fresno, California.

Little Stories of Success

No. 9

Mr. Fred Rollins of Chico, who bought a Caterpillar "60" in March, 1914—and incidentally cleaned up \$1700 the first month he owned it, plowing night and day for his neighbors—dropped in the other day to tell us his story of success.

Much of Mr. Rollins' work with the Caterpillar has been stationary work, and for this he says the Caterpillar has them all beat. In the rice fields, where a separator sinks in mud up to the sills, Mr. Rollins can go with the Caterpillar, and be ready to run right away without stopping to build up any foundation or blocking for the tractor. He threshed a rice crop for one neighbor, where a short time before when this same crop was harvested, the binders had to be pulled through the fields on sleds.

Mr. Rollins is convinced that the right motto in buying a tractor is "Quality First." What's your problem? Write us.

Bees

and

Their Care

GIVE THE BEE A BOOST

HAVE the bees lost their old habit of industry, which for generations has proved such a convenient example to lay before the young and has served as a ready-made advertising idea for savings banks? A perusal of statistics collected by the government leads us to believe that either the bee is not so efficient as he was in the old days or his keeper has not been keeping up with the procession. The national appetite for honey seems to be normal, and the bee seems to be hunting the first blossoms with unabated energy, so the solution of the more-honey problem must lie with the bee farmer.

No doubt such diseases as foul brood have had a great deal to do with reducing returns from the hive. The industry has looked so small—even though the annual production of honey and wax is worth about \$6,000,000—that the tendency has been to neglect it. Not long ago some of the newspapers were moved to abortive attempts at humor because a member of the Pennsylvania legislature introduced a bill providing for the expenditure of \$50,000 for the investigation of bee diseases. An occasional appropriation of this size is not extravagant when we consider that the bee business in Pennsylvania returns more than a quarter of a million dollars a year. Production is on the down grade, but why should it be allowed to slide to the bottom?

Nothing else produced on the farm includes such a high percentage of sunshine and fresh air, and those commodities are not expensive. Honey is a by-product of farm crops that are grown for other purposes. Therefore honey is almost pure velvet. With the increase in the production of alfalfa and sweet clover there should be an increasing field of operation for the bee. Other states besides those on the Pacific Coast, where the business is growing, should be pushing the industry. Attempts to provide substantial assistance deserve more attention than mere humorous comment.—Country Gentleman.

VALUE OF COLONY OF BEES

Regarding the value of a colony of bees Mr. Mendleson of Ventura writes:

"This would depend on the general condition of the colony. If the colony is Italianized and the hives are in good condition and well painted, and the brood frames and combs in best condition they are worth five dollars per single story colony, but if the hives and combs are poor, etc., they are only worth what one can get for them."

As to production per hive and prices Mr. Mendleson adds:

"That depends on the location, the condition of the colony of bees, and the keeper. If in prime condition, in a good honey flow, we consider an average of 200 pounds per colony good, but we have an occasional year when the production runs up to 300 or 400 pounds or more per colony. However, these heavy flows are few and far between. I was told by the late Mr. R. Wilkin that he averaged in good,

bad and indifferent years about 55 to 56 pounds per colony, but in the sage ranges in the past ten to 15 years the average has been much less. In the three years, 1898, 1899 and 1900, we never got a pound of surplus. In the alfalfa ranges the averages are much higher.

"The average price, like value of hive and production, also depends on quality. Previous to July or August, 1914, average prices for white honey have ranged from five to eight cents. Some have sold as low as four cents. Low prices are generally the result of lack of organization and ignorance as to general crop conditions. If the honey producers were as well organized as are the buyers we would undoubtedly receive better compensation for our labors. Serious loss of bees from disease has also helped to eliminate or reduce profits. In many cases whole apiaries have been wiped out and yet prices have been forced down regardless of the small number of colonies remaining. Heretofore honey prices have kept pace with prices of sugar but organization of buyers has resulted in conditions which are just the reverse.

DESTROYING WASPS

The wasps known as hornets and yellow jackets do considerable harm to ripening fruit by eating through the skin in order to suck out the fruit juices. Much of this harm is attributed to bees but in almost all cases when bees are feeding on the exuding juices they are frequenting holes made by other insects. Again, in camp the pleasures of an outdoor meal is often spoiled by these same wasps pouncing down on the food spread out and carrying it away bodily. The wasps pay little attention to people when hungry and will dart down, buzzing about in a most annoying way. At such times it is ill advised to strike the wasps and it is far better to let them have their way, for an enraged wasp will pursue its tormentor for some time.

Dr. A. L. Melander, entomologist of the Washington experiment station, gives the following simple method of destroying wasps:

These wasps nest in the ground or in old trees. If the nest can be discovered, which usually means watching the insects when they fly home, the entire colony can be quickly exterminated. A gallon jug, quarter-filled with water and placed next to the nest, is all that is needed. A wasp will emerge from the nest opening, perceive the jug, and fly angrily at it. The hollow sound of its buzzing, echoing from the jug will make it enter, when it falls into the water. Wasps are able to communicate with each other and the imprisoned wasp possibly calls to its sisters. At any rate the colony, one by one, in the course of the day, will find its way into the jug. This system is perhaps easier than the distribution of poison on food for the wasps. If the latter method should be tried a little Paris green or white arsenic may be distributed on minced meat and scattered where the wasps will find it.

"K-T" Screw Lift Gate (Type W).

Modern Irrigation Methods

This Company originated the Valve System of Irrigation—which completely revolutionized the methods then in vogue. Ever since that time, our motto has been—"When better gates and valves are made, K-T will make them." In line with this policy, we have finally evolved the K-T Type W Gate—illustrated above—the acme of perfection in irrigation appliances.

You cannot afford to experiment in Irrigation. Profit by the experience of men who have devoted a lifetime to the business. Our advice is free. What would you like to know?

The Lawn and Flower Garden

THIS MONTH

Written for California Cultivator

NOVEMBER is bulb planting month. Nearly all the spring bloomers should be planted. Daffodils, hyacinths, tulips, iris—while the latter is not strictly a bulb for practical purposes it is usually so classified—and many others should be planted. If iris has been standing several years better results will be secured by breaking up the clump and resetting. Plant tulips six or more inches deep unless the soil is very heavy, in which case five inches will answer. A mulch should be maintained over the surface so that it will not harden and prevent the young shoots from coming through. Amaryllis which bloomed a few weeks ago may now be divided. It must be remembered, however, that in dividing these clumps there will be a loss of some flowers the first season, but where they have been several years in one cluster the young bulbs push out of the ground the old ones so that sub-division is necessary. However, this does not occur with bulbs under three or four years of age.

Annuals may be planted not only in May but, as in the case of our native California poppies, also this month. We say they "should" with emphasis for nothing is handsomer, and it now appears that California will be visited by many thousands of tourists another year as well as during this—exposition year. San Diego is taking steps to continue her exposition through another winter and funds have been subscribed to that end which almost assure it. Europe will be in no position to receive visitors, even if the war stops at once, therefore California

must be in a position to entertain. Make our state beautiful by scattering poppy seed everywhere. There are many others of our native annuals. Most of the seedmen have mixtures of these seeds. It is best to make a bed and give the seed a good chance for the first few weeks, with water if possible. If this cannot be done scatter the seed and let nature do her best.

Plant abundantly centaurias, pansies, stocks, calendulas, calliopsis, candy-tuft, gaillardias, mignonette and others of the old time favorites. Most of these will come into bloom in about four months, some of them sooner. Another plant which is very satisfactory is scarlet flax.

Clean up the old golden glow, golden-rod, Shasta daisies, or beds of other perennials which have finished blooming. If the ground is needed for other ornamentals these plants may be heeled in and an abundance of water turned on them. In January and February they will send out a mass of young growth which may be broken off and new plantings started. This is the best way to secure thriftiest plants.

Give the lawn a thorough raking, with application of fertilizer. If there is Bermuda grass in it—as there is reasonably sure to be—a good application of fertilizer will green up the blue grass which will keep green through the winter. If its growth is not checked more or less the Bermuda, which grows but little through the winter, will soon turn brown and the lawn will look most unsightly. If nitrate of soda is used the best means of application is to dissolve and apply through the sprinkler.

Small Fruits

Vegetables

THIS MONTH

Written for California Cultivator

MANY a fine meal can be had from the winter garden. Of course one must use care in choosing the seed for most sections in California, but the hardier plants will grow continuously from now until spring.

In Sacramento and San Joaquin Valleys

If onion seed were planted during September and October, November is a good month in which to reset the young plants, either for the home garden or for field culture. These are probably nearly as large as a lead pencil, which is the best size for transplanting. One point in onion culture is thorough tilth. Before the seeding is attempted have perfect seed bed preparation. There should not be a clod in sight and the soil should be moist clear up to the surface. If horse cultivation is to be followed set rows two and a half or possibly three feet apart. Before taking up the young plants from the original seed bed irrigate heavily. This fills the plant with moisture and besides puts the ground in better condition for removing the young plants without tearing the roots unnecessarily. Do not pull plants without first loosening the soil with shovel or spade point.

Where one wishes to grow onions direct from seed for later market he may sow during the last of November or even into December in well prepared seed bed or field.

Garden peas may still be planted.

Sow in drills, though some prefer to sow in hills two or three feet apart. The latter method gives better opportunity for picking. The favorites are Stratagem, Telephone and Premium Gem.

In addition there may be planted cabbage, turnips, lettuce, radishes and all the hardier vegetables.

Southern California

Beets, carrots, Brussels sprouts, endive, cabbage, cauliflower, lettuce, leeks, onions, turnips, parsley, peas and spinach may be planted in almost every district of the southern end of the state.

Those who wish to grow very early peppers or tomatoes may now plant them in hotbed or at least in cold frame, but great care must be exercised to keep these growing during the cooler months. Of course, this early planting is only justifiable in sections which are comparatively free from frost. Peppers planted now, if well cared for, would make large stalky plants to put into the garden in February. It is possible to plant the chayote this early. However, for early planting it is usually placed in pots, lying on the side with the fruit not more than half covered, the blossom end slightly higher than the stem end. Put the pots in a warm place and keep only moderately moist for it is not desired to put them in the open ground too early, and besides if too much water is applied the entire seed may decay.

This is a good month in which to plant garlic, which is very exacting as to soil. It will not do well in heavy, moist land, light, loamy or sandy soil being required.

Get The Hidden Treasure From Your Stump Land

Every stump on your farm takes up from 100 to 400 sq. ft. of rich ground that would be yielding bumper crops. Take out the stumps! New land often yields \$200 to \$300 profit the first year.

Telephone Economy

THE Kellogg farm telephone will save you money because: It is carefully made of the best material. It is easy to install and simple in construction. It does not get out of order easily, and is constructed for the heaviest farm line service. It is long lived. Thousands and thousands of Kellogg telephones are now in service over ten years. It is not affected by climatic conditions; has proper insulation of all parts; heavy nickeling of outside metal; iron and steel parts are copper plated and oxidized—they cannot rust, scale off and cause short circuits.

Kellogg Telephones

Every Kellogg telephone is equipped with our standard transmitter, over a million of one type in service today. Every transmitter is guaranteed against inherent defects for five years. This phone will ring over the longest, heaviest loaded farm lines. It can be equipped with a condenser, vastly improving the service of your lines. It can be equipped with a push button, enabling you to call central secretly and call other parties without disturbing your neighbors. "Use is the test," judging solely by the service this telephone is giving today in all parts of the world. It will give you telephone transmission superior to anything on the market. It is the master telephone. Write today for our bulletins describing in plain language just how the Kellogg telephone will do these things for you. **Write for Bulletin 24.**

THE FEEDING POWER OF PLANTS

Written for the California Cultivator
By Gordon Surr

HAPPY is he who knows the causes of things, says Virgil, and in many cases such knowledge may bring profit as well as pleasure. In the publication, "Science," of April 23rd, 1915, Mr. E. Truog advances a new theory on the feeding power of plants, dealing particularly with raw rock phosphate. Mr. Truog remarks that "with the rapidly increasing use of phosphate fertilizers, the subject has become one of considerable economic importance, since it may be possible that with a proper selection and sequence of crops as regards their feeding power, the cheap insoluble phosphate fertilizers may be used with greater advantage." Mr. Truog is a member of the staff of the department of soils of the Wisconsin experiment station and has made numerous experiments upon the availability of various phosphates, which were referred to in the Cultivator of June 17th, 1915. The feeding power of plants is not only of scientific but also of eminently practical interest and the same is true of many other subjects, popularly supposed to belong wholly to the realm of the "high brow."

The following is a review, or possibly I should say attempted review, of Mr. Truog's interesting article in "Science," the quoted matter having been taken bodily from the article.

It seems that the roots of practically all plants give off large quantities of carbonic acid and normally, at the most, only traces of other acids. Some have suggested that the amount of carbonic acid yielded may account for differences in feeding powers, which view, however, receives little support from experiments. In any event, carbonic acid is without doubt of great importance in rendering plant food available, and through its agency, for example, raw rock phosphate is converted into dicalcium phosphate and calcium bicarbonate. Dicalcium phosphate is the so-called "reverted" or "citrate-soluble" phosphate and, together with the water-soluble form, is styled "available" in fertilizer analysis. This chemical reaction, like many others, is reversible and under some conditions calcium carbonate causes dicalcium phosphate to change to the more insoluble form present in raw rock.

Now chemical action tends to cease unless all the products are removed and, in this case, if the plant takes up all the dicalcium phosphate as fast as it is formed from the rock phosphate, but only absorbs some of the calcium bicarbonate, the reaction gradually comes to a standstill and no more raw rock is dissolved. In other words, equilibrium is reached due to the accumulation of the calcium bicarbonate. Consequently if a plant could not take up all the bicarbonate of lime it would soon run short of soluble phosphate from the raw rock. It, however, both the dicalcium phosphate and calcium bicarbonate are steadily absorbed by the roots as fast as these products are formed, solution of the raw rock phosphate likewise goes

steadily on. Hence it would appear that plants requiring considerable lime would also make good use of rock phosphate. Mr. Truog therefore advances the following hypothesis:

"Plants containing a relatively high calcium oxide content have a relatively high feeding power for the phosphorus in raw rock phosphate. For plants containing a relatively low calcium oxide content the converse of the above is true. A calcium oxide content of less than one per cent may be considered relatively low. Corn, oats, rye, wheat and millet belong in this class. A calcium oxide content of somewhat more than one per cent may be considered relatively high. Peas, clover, alfalfa, buckwheat and most of the species of the cruciferae belong in this class."

Furthermore, Mr. Truog and other investigators have found that the availability of raw rock phosphate is greatly increased by sulphate or nitrate of ammonia, in the case of plants which normally do not get much phosphorus from raw rock. This fact strongly supports the above theory, as calcium bicarbonate is far more soluble in solutions of ammonia compounds than is water alone, owing to which, some of the calcium bicarbonate is kept in solution, which otherwise would prevent further action. Keeping the products of a reaction in solution has the same effect, to some extent, as actually removing them. For example, in using cyanide for fumigating trees, cyanide of sodium, sulphuric acid and water are employed, the products being hydrocyanic acid gas and sodium sulphate. The water serves to keep the sulphate of soda in solution, but for which the liberation of the hydrocyanic acid gas would be incomplete. (The good results following the application of sulphate of ammonia may possibly be due in part, at least in some cases, to phosphorus rendered more available.—G. S.)

It will be seen from what follows that Mr. Truog's theory may have a broader application. He remarks that "with the theory here proposed it is possible to predict from the calcium oxide content of a plant whether or not that plant in quartz cultures will be a strong or weak feeder on raw rock phosphate. Under soil conditions there are many subsidiary factors that influence the availability of phosphates, and hence under such conditions the relative growth of a plant cannot be taken rigidly as a true index of its feeding power for the limiting element which is supplied in an insoluble form. Seeming deviations from the theory may result under such conditions. It is possible that with proper restrictions the theory can be applied to the feeding power of plants in a broader way, involving the use of other insoluble plant-food materials besides rock phosphate, and the general theorem could then be worded as follows: The feeding power of a plant for an insoluble substance depends primarily upon two conditions, viz.: (1) The solubility of that substance in carbonated water and, (2) Whether or not the plant removes from solution all the products of the solubility reaction in the proper proportion, so as to allow the solubility reaction to continue indefinitely."

HUMBOLDT COUNTY'S PURCHASING AGENT

From B. H. Crocheron, state leader, we have the following:

"Mr. Christiansen, our farm adviser in Humboldt County, has forwarded to me your letter of September 14, asking information about his hopper-dozer and also about the upchasing activities of the farm bureau. Mr. Christiansen is replying direct to you regarding the grasshopper control work and I am glad to say to you as follows concerning the purchasing department of the farm bureau:
